Laura herself showed how devoted was her love; she was always on the spot, hovering noiselessly about the sick-bed like a bird; she would sit motionless for hours, and when Ilse opened her eyes, and her strength was a little restored, she had always something pleasant to tell her. She informed her that Mrs. Struvelius

had come on the second day, and, after making a little speech to the Professor, in which she solemnly claimed the right of a friend, she seated herself on the other side of the bed. He, however, had not listened to what she said, and had suddenly started and asked who she was, and what she wanted there. She had answered him quietly that she was Flaminia Struvelius, and that her heart gave her a right to be there; thereupon she repeated her argument, and at last he gave in. "Her husband, too, has been here," added Laura, cautiously. "Just when you were at the worst, he rushed up to your husband, who shook hands with him, but, between ourselves, I do not think he knew him. Then," related Laura, "that absurd fellow, the Doctor, came the very first evening, with a blanket and a tin coffee-machine, and declared he would watch also. As he could not be allowed in the sick-room, he placed himself with his tin apparatus in the Professor's room; the Professor took care of you, and the Doctor took care of the Professor." Ilse drew Laura's head down to her, and whispered in her ear, "and sister Laura took care of the Doctor." Upon this Laura kissed her, but shook her head vehemently. "He was not troublesome, at any rate," she continued; "he kept very quiet, and he was useful as a Cerberus to keep away the visitors and dismiss the many inquirers. This he did faithfully. If it were possible for you to see him, I believe it would give him great pleasure."

Ilse nodded. "Let him come in." The Doctor came; Ilse stretched out her hand towards him, and felt from the warm pressure, and from the emotion on his countenance, that the learned confidant of her beloved husband, on whose approbation she had not always counted, was a true friend. Ilse found also that other gentlemen pressed to her bedside.

"If the wife of my colleague will give me audience, I beg to apply for admittance," said a cheerful voice, outside.

"Come in, Professor Raschke," cried Ilse, from her bed.

"There she is," exclaimed he, louder than is usual in a sick-room, "returned to the glad light after a dangerous crisis."

"What are the souls of animals doing, dear Professor?" asked Ilse.

"They are eating the leaves in the adjacent woods," answered Raschke; "there have been numerous lady-birds this year; see, there is one flying about the medicine bottle; I fear it has used me as a stage-coach to come in to visit you. The trees stand like brooms, and the poultry are so fat that all prejudices concerning the enjoyment of these fellow-creatures are quite set aside. I count the days until the happy moment

\* Translation copyrighted

arrives when my friend will follow me to give evidence of my improvement."

It was a slow recovery, but accompanied by abundant feelings of comfort; for fate grants to convalescents, as a compensation for danger and suffering, to see all around them, free from the dust of the work-a-day world, in pure outlines and fresh brilliancy. Ilse now felt this mild poetry of the sick-bed, when she held out her hand to the honest Gabriel, which he kissed, holding his handkerchief to his eyes, whilst the Professor extolled his devoted service. She felt this pleasure also when going down into the garden, supported by Laura's arm. Mr. Hummel advanced to her respectfully, in his best coat, with his hair brushed down and his defiant eyes softened almost into a mild expression, and behind him followed slowly his dog Spitehahn, his head also bent in unwilling respect. When Mr. Hummel had offered his homage, he said, sympathisingly: "If you should ever wish for a little quiet exercise, I beg of you to make use of my boat at your pleasure." This was the greatest favor that Mr. Hummel could show, for he did not credit the inhabitants of the neighborhood in which he lived with any of the qualifications which are necessary to make aquatic excursions. He was undoubtedly right when he called a voyage in his boat a quiet amusement; for this season the boat had mostly rested upon bottom on account of the shallowness of the water and the greatest amusement that it could offer was to stretch out the hands to both banks, and tear up a tuft of grass with each.

When Ilse could sit in her room again, it often happened that the door opened gently, her husband entered, kissed her, and then returned with a light heart to his books. When she saw his tender anxiety, and his happiness in her recovery, and in again having her near him, she no longer doubted his love, and felt that she ought no longer to be anxious about what he thought of the life and passing away of individuals and of nations.

#### CHAPTER XX.

##### A COURT MATTER.

Among the inquiries after the Professor's wife during her illness, there was one made by a stranger. Gabriel excited a little astonishment in the household when he mentioned: "Once, as I was running to the apothecary, a man of refined appearance was standing in the street talking with Dorchen. Dorchen called to me, and the man made inquiries concerning everything, and your illness seemed very inopportune to him."

"Did you ask his name?"

"He would not give it. He was from your part of the country, and had only made inquiries through the town."

"Perhaps it was some one from Rossau," said Ilse, annoyed. "I hope he has not made father anxious by his talk."

Gabriel shook his head. "He meant something by it; he tried to find out everything about the house, and asked impudent questions that I would not answer. As he had a crafty look, I followed him to the nearest inn, and the waiter told me that he was the chamberlain of a Prince." Gabriel mentioned the name.

"That is our Prince!" cried Ilse; "what can make him take such interest in me?"

"The man wished to take some news home," replied her husband. "He was among the retinue on the hunting expedition last year, and it was kindly meant."

This answer quieted Gabriel, and Ilse, much pleased, said: "It is so nice when one's Prince takes such interest in his children who are in trouble far from home."

But there was some foundation withal for Gabriel's shaking his head; the inquiries did signify something.

Behind the buildings of a country farm-house, a young lady could be seen, tying up the wild flowers of the meadow in a large bouquet; a ball of blue yarn rolled in her lap whenever she added a fresh handful of flowers. A youth was running about in the deep grass before her, busily engaged in collecting flowers, placing them in order and arranging them according to color for the nosegay-maker. It was evident that the youth and young lady were brother and sister from the marked family likeness of both countenances, and the rich walking-dress left no doubt that they had not blossomed amidst the clover and camomile of the soil, even though the horses' heads and the galoon-trimmed hats of their attendants had not been visible through a gap between the barns.

"You will never finish your bouquet, Siddy," said the young man, incredulously, to the lady, as she awkwardly tried to knot the broken thread.

"If the thread were only stronger!" cried the busy maiden; "do knot it for me!" But it turned out that the young gentleman was not more expert himself.

"Look, Benno, how beautiful the bouquet will be,—that was my idea."

"It is all much too loose," retorted the young man.

"It is good enough for the first time," replied Siddy; "there, see my hands, how sweet they smell." She showed the blue points of her little fingers, holding them up to his face; and as he good-humoredly sniffed at them, she playfully rapped him on the nose. "I have enough of the red flowers," she continued,

again occupied with the nosegay; "now I must have one more circle of white."

"What kind of white?"

"If I did but know their names," replied Siddy, thoughtfully; "I mean Marguerites. What do you call these white flowers?" she asked, looking back to a countrywoman who stood in a respectful attitude some steps behind the busy pair, looking on at their proceedings with a pleased smile.

"We call them daisies," said the woman.

"Ah, that's it?" cried Siddy; "cut long stalks, Benno."

"They haven't got long stalks," said Benno, plaintively, carrying her what he could pick near at hand. "I will tell you what astonishes me," he began, sitting down by his sister on the grass. "This meadow is full of flowers; when it is mowed the grass becomes hay, and one doesn't see a thing of all the flowers in the hay."

"Really?" replied Siddy, tying another thread. "They are probably dried up."

Benno shook his head. "Only look at a bundle of hay; you will see few of them in it. I think the people gather them beforehand, and sell them in the city."

Siddy laughed, and pointing over the green fields, said, "Look around you; they are countless, and people only buy the more lasting garden flowers; yet these are far prettier. How lovely is the star in the flower of our Lady Marguerite." She held the nosegay up to her brother, and looked lovingly at her work of art.

"You have completed it after all," said the young man, admiringly; "you were always a clever girl, Siddy, and I am so sorry that you are going away from us," he added, feelingly.

His sister gazed earnestly at him. Are you, really? And will you always think kindly of me, my brother? You are the only one here from whom I find it hard to part, Benno. We are like two orphan children sitting in the snow of a cold winter's night."

She who thus spoke was Princess Sidonie, and the sun was shining warm on the blooming meadow before her.

"How do you like my bridegroom?" she asked, after a pause, busily winding the blue thread around the finished nosegay.

"He is a handsome man, and was very kind to me," said Benno, thoughtfully. "But is he clever?"

Siddy nodded. I think he is. He writes nice letters. If you like, you shall read one."

"I shall be glad to do so," said Benno.

"Do you know," continued Siddy, mysteriously, that I write to him every day! For I think a woman ought to confide everything to her husband, great and

small, and I wish to accustom him and myself to that. To make sure, I write to him under a false address, and my maid takes the letters to the post, for I fear my stupid words might otherwise be read before they go." She said this with apparent indifference, examining her bouquet all the while. "He will hear every little detail of this visit to Lady Marguerite, and that it has given you pleasure. Now the bouquet is ready," she exclaimed, gaily. "I will fasten a handkerchief round it; we will take it in the carriage, and I will set it on my writing-table."

Benno laughed: "It looks like a club. You can lend it this evening to the savages in the ballet."

"It is better than the flat things which one can't even put in water," replied the sister, jumping up; "come along, we will carry it to the pump."

They hastened to the farmyard, followed by the peasant woman. Benno took a bucket and carried it to the pump.

"Let me pump," cried Siddy. She seized the handle and tried to move it, but did not succeed; only a few drops ran into the pitcher.

Benno objected. "You are too clumsy," he said, "let me try it." He now took hold of the wooden handle, and Siddy held the bucket. He pumped vigorously, and the water spurted out over the bucket, upon the hands and dress of the Princess. She made a slight exclamation, let the bucket drop, and then both burst out laughing.

"You have made a nice mess of me, you naughty wretch," cried Siddy. "Oh, it makes no difference, mother," she added, to console the woman, who ran up terrified, clasping her hands. "Now, Benno, an idea has occurred to me: I will put on a gown of our dame Marguerite, and you a smock-frock of her husband, and when our cousin comes he will not know us, and we will surprise him."

"If all only turns out well," rejoined Benno, doubtfully.

"No one sees us," urged Siddy. "Good mother," she said, coaxingly, to the country-woman, "come into your room, and help us to dress."

The young Prince and Princess took the woman by the hand and led her into the house. Benno laid his coat down in the hall, and looked doubtfully at the smock-frock, which was brought to him by a stout maid, who assisted him in putting it on. The elegant peasant lad seated himself patiently on a bench, while waiting for his companion, and employed his leisure in turning a grinding-stone and inquisitively holding the tips of his fingers close to it. Whilst he was making this experiment, he received a slight blow on his back, and with astonishment beheld, standing behind him, a little peasant maid, in blue petticoat and black jacket, and the usual cap of the country on her head.

"How do you like my appearance?" asked Siddy, crossing her arms.

"Charming," exclaimed Benno. "I had no idea that I had such a pretty sister."

Siddy made a rustic curtsy. "Where have you kept your eyes, you foolish boy? Now we must help in the household. What work can you give your new servants, Mother Marguerite?"

The woman simpered. "There is the fodder for the cows to be steeped in hot water," she said.

"No more water, we have had enough of that. Come, Benno, we will set the table in the garden under the fruit-trees, and then carry out the curds and cream."

They went into the room, and brought out a small bench placing it on the grass-plot, under an apple-tree; then they hurried back for the plates and spoons. The woman and the maid carried out the table with a large bowl of milk, and some rye bread. Siddy tripped about nimbly, laid the tablecloth, and carefully smoothing it out, placed the colored earthenware upon it.

"Look!" whispered Benno, pointing with a troubled air to the worn pewter spoons.

"We can wash them, and dry them with green leaves," advised his sister.

They ran with the spoons to the pump, and rubbed them hard with leaves, but they could not polish them.

"That's just their way," said Benno, consolingly; "it is part of a country picnic."

The table was laid, and Siddy brought forward some stools and wiped them with her cambric handkerchief.

"You are the Hereditary Prince," said Siddy, "so you must sit on the bench, and we others on each side of you. The rye bread must be crumbled, but every one can do that for themselves. There is no sugar, but that doesn't matter."

They sat waiting before the milk bowl, beating time with the spoons. A little green apple fell plump into the milk, and spattered it about. Both burst out laughing, jumped up, and collected the unripe apples and plums from the grass, peering across the hedge at a path which led through the woods to the town.

"There he comes," cried Benno; "hide yourself!"

A horseman rode up at a gallop. It was a young officer. He threw himself off his snorting horse, fastened it to a post, and leaped over the hedge. But he stopped amazed, for he was greeted with a cross-fire of unripe apples and plums from each side of the hedge. He quickly collected some of the green shot, and defended himself as well as he could against the assault. The little peasants sprang forth, and Benno cried out, "You have kept us waiting a long time."

Siddy made him a curtsy, saying, "Prince, the butter-milk is served."

Prince Victor looked with evident admiration at the young peasant. "Ah!" he said, good-humoredly, "now one sees how small the feet are before which one does homage. All right, children. But first of all I must have satisfaction for the attack."

So saying, he knotted his pocket-handkerchief; the brother and sister laughed, and said, beseechingly, "Be good, cousin, we will not do it again." "Oh, dear Ogre, pardon and compassion!" implored Siddy, raising the corner of her apron to her eyes.

"Nothing of the kind," cried Victor; "I shall no doubt be arrested again on your account, and shall therefore punish you beforehand." He chased them round the table.

"This is disagreeable, cousin," cried Siddy; "let us leave off this nonsense, and come to the table. I will help you. There is the cream. Everything must be fairly distributed when Victor is present."

Victor examined the table. "It is all very nice, but there is no sugar."

"There was none to be had," cried the brother and sister, in chorus.

Victor put his hand into his pocket, and placed a silver box on the table. "What would become of you without me? Here is the sugar." He again dipped into his pocket, and brought out a leathern flask with a small drinking-glass. "Here is another important thing, the cognac."

"What for?" asked Siddy.

"To drink, most gracious cousin. If you will put this cold mess into your interior without cognac, I shall not venture to oppose you; but I advise you, Benno, as a man, to take care of your health."

Both held their spoons with an air of embarrassment.

"Is that necessary?" asked Benno, distrustfully.

"It is a pacifier, as our doctor says," declared Victor; "it calms and quells the rebel substances into quiet submission. If you refuse the cognac, it is just like on the way to hell. The path is easy at the beginning, but what follows is chaos. At all events, you would be spared the ballet to-day. Is that clear to you?"

"It is very clear," cried Siddy, "that you are as usual making sport of us. Give him a rap on his fingers, Benno."

Benno tapped his hand with the spoon. Victor sprang up and parried it, in fencing posture, with his spoon; and the brother and sister chased their cousin merrily about among the trees.

They were disturbed by a hasty tread, and a lackey made his appearance for a moment at the garden-gate. "His most Serene Highness is riding this way," he called out.

(To be continued.)

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the nineteenth century is faith in the ideal unities as possible in fact." Price, 10 cents; 10 copies, 30 cents; 100 copies, \$1.00.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.

Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.

Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.

The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.

A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$1.00.

The Bible and Science. By John Weiss. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

A complete set of the Pamphlets named in this advertisement, including about 500 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR & CO., Publishers.

## CONTENTS OF RECENT NUMBERS

## OF "THE OPEN COURT."

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40 and 42.

The Sciences of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

## THE FIELD-INGERSOLL CONTROVERSY.

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Gladstone's Remarks upon the same will be found in Nos. 41 and 42. The questions and issues involved are treated from an independent and impartial standpoint. The inefficacy of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position

How Shall We Keep Sunday? An Answer in four parts. 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31 and 34.

To the *Kinetic* conception of the world's mechanism Vogt opposes his hypothesis of a *continuous* world-substance completely filling space and whose sole manifestation of power consists in *contraction* or *condensation*. He claims that the kinetic or mechanical theory which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-morphism which transforms the most complex conditions and processes of psychical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt propounds his conception which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## THE INDIVIDUALITY OF ATOMS AND MOLECULES.

REV. H. H. HIGGINS, M. A., Jr. Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *bias*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesis endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problem of Memory."

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is made here of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with *The Open Court*, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## UNDERSTANDING ONE'S NEIGHBOR, AN ENGLISH MONIST.

BY THE SAME AUTHOR. In Nos. 27, 34 & 37.

## ECONOMIC CONFERENCES.

WHEELBARRROW.....In Nos. 37 and 40.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon Simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## TO ARMS, THE POETS OF LIBERTY AND LABOR, AND MAKING SCARCITY.

BY THE SAME AUTHOR. In Nos. 22, 26 & 34.

## ORIGIN OF REASON.

LUDWIG NOBLE.....In No. 33.

An essay of great importance will greatly help to explain the views of Max Müller. The same number contains an editorial upon Monism and Philosophy, in which is discussed the Identity of Language and Thought, the theories of Nietzsche and Müller, and the proof with which modern philology has corroborated the monistic conception.

In an intelligent review of Max Müller's Introductory Lectures on the "Science of Thought," published by THE OPEN COURT PUBLISHING CO., Mr. Ernst says in the Boston *Beacon*:

"Max Müller's supremely simple theory is hotly disputed, \*\* but it is easily vindicated, provided one is not a dualist on principle. \*\* Max Müller explains with a master's clearness and firmness what has barely been hinted at in these columns. Now, as a matter of fact, half the trouble in life, half the lawsuits in our courts, and most of the quarrels in society arise from the petty fact that men and women, the college graduates not excluded, are not sufficiently acquainted with their own language. They think they know what they say; but until one really knows what one says,—precisely as the banker uses figures in a cheque,—there will be trouble."

The *Chicago Herald* says: "The lecture on the 'Identity of Language and Thought' is also full of novel thought that cannot fail to be suggestive to all who take an interest in language problems, and in his discussions of the 'Simplicity of Thought' there is a leading up toward another branch of this great subject, which grows more fascinating as it is more fully developed. A book from such a source would always command attention, and there is no doubt that 'The Science of Thought' will make an impression on the philosophers of all schools."

The *Cincinnati Times Star* says: "The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."

*Book Chat* says: "The subject is discussed with great clearness and simplicity."

Three Introductory Lectures  
—on—

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street, Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

"The world-wide reputation of its author, as the greatest living authority on philological subjects, is enough to command the careful perusal, and respectful consideration of all who may take up this little book."—*Chicago Legal Advertiser*.

"It will help to reconcile systems of philosophy hitherto supposed to be antagonistic."—*Telesto Weekly Blade*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The absurdity of the theory is manifest."—*New York Science*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"Max Müller explains with a master's clearness and firmness what has barely been hinted at in these columns."—*Boston Beacon*.

## MINERVA INSTITUTE, HIGHER SCHOOL for GIRLS,

N. E. Corner Paulina Street and Berceau Avenue,

RAVENSWOOD, ILL.

This Day and Boarding School for Girls, besides a free course in English branches, Science, and Mathematics (preparatory to college), offers unusual advantages for the study of German and French with native resident-teachers, and excellent opportunity for art, music, elocution and needlework. The situation of the school in this quiet and attractive suburb warrants the promotion of health.

For Catalogue and Information apply to Mrs. Amalia Ende, Principal, P. O. Box 383, RAVENSWOOD, ILL.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monim* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order to live, in order to live well and be blessed.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

THE OPEN COURT has for contributors the leading thinkers of the old and new world.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

## RATES OF ADVERTISING.

"Wheelbarrow" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft as was when I was a strong man. I was by profession a 'railroad man,' my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticises many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

EWALD HERING.

Nos. 22 and 33 contain a very eloquent article on "The Specific Energies of the Nervous System," by Dr. Ewald Hering, Professor of Physiology at the University of Prague. His useful additions to physiological science are enumerated in the *Encyclopaedia Britannica*, under the heading of "Physiology." Several pages of the *Encyclopaedia* are devoted to Dr. Hering. His discoveries make an era in physiological study, and we remind our readers of his learned and instructive essay on "Memory," published in Nos. 6 and 7 of THE OPEN COURT.

Dr. Hering's article on the "Specific Energies of the Nervous System," while profound in argument and full of information in its details, is at the same time so simple in statement and so easily understood that the reading of it is a pleasure as well as a study. Such articles enable us to see farther into Nature than we formerly did, and they reveal to us that her "specific" work is much of it so delicate and fine that the most powerful microscope cannot make it visible to the material eye of man. Throughout the essay the following proposition is maintained: "The germs of each animal species possess an inherent and innate faculty, viz: a *specific energy* which directs its development in a manner characteristic to this animal and no other. Again, each single germ possesses an individual energy which, in addition to the normal features of its species, secures an individual character to its future development."

GEN. M. M. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

## AGNOSTICISM.

BY MONCURE D. CONWAY.

While voyaging on the Southern seas our world was suddenly changed. The sun became blue and sank behind a horizon resembling a wall of copper. After a time we reached an island, and heard that it was a great earthquake and volcanic eruption in Batavia that had been so reflected on sea and sky. In the Indian Ocean we sailed for some days through masses of floating lava. One day we passed near a huge palm, with its roots on, which must have been a thousand miles from the coast from which it was hurled,—a coast we had avoided because its light-houses were destroyed. On this huge floating palm were perched many birds of various species, and from different climes. We passed near enough to hear if there had been any note. But they sat as if unacquainted with each other,—peaceful, silent, motionless.

The incident has been recalled to me by the arraignment of Agnosticism in *THE OPEN COURT* (June 28, 1888). Surely Agnosticism is only an orthodox palm hurled by the Darwinian earthquake out from its habitat. Wings of those whose nests are desolate, of others in migration, and they who are weary of buffeting the tempest, have here for a time alighted. From the time of Paul who, when argument fails, rebuffs the inquirer, as Jehovah did Job ('Who art thou?'), to the time of Robinson Crusoe, when Friday asks 'Why not God kill debbil?', Agnosticism has been the virtual refuge of theology. That indeed is natural and inevitable; for theology is a retained attorney whose business it is to defend an institution, with great interests, resting on a foundation which must be concealed. Its art is that of the Etruscan priests who kept the mighty gods veiled (*Dii Involuti*). It might be said they were too resplendent to look on; really, they dated from such a rude period that they were not fit to be seen by a more refined and critical age. Only so long as their grotesque faces were not seen could they be adapted to the popular imagination, and their authority retain respect. A corollary of this is that the only effectual reply to a superstition is to explain it, to unveil its origin and history.

But what has the rationalist to do on this raft? Notwithstanding the distinguished names associated

with Agnosticism I cannot help suspecting that it is mere weariness of wing in facing the conventional tempest which has brought freethinkers to seek rest on the floating palm. I knew an atheist whose son was troubled at school for openly calling himself the same. "My child," said the father, "you must not call yourself an atheist, but an agnostic; then you will not be troubled."

The ethics of such a course each must determine for himself, at present; for such connotations surround words like 'atheist,' 'infidel,' 'freethinker,' that no man can truly state his belief by adopting them. Nor can one wonder that some new and less odious term should be sought. But, however unimportant this attitude may be in some, it is necessary that public teachers shall be exact thinkers. How many preachers who are sheltering their dogmas under Herbert Spencer's "Unknowable," are aware that Herbert Spencer has declared that he has no reason to suppose this "Unknowable" either intelligent, or good, or moral? Nevertheless, it appears to me the poorest piece of work Spencer ever did was to raise this phantom of defunct theology. No man knows better that all foul creatures can lurk and breed in its cavern of mystery.

In addition to the philosophical exposure of Agnosticism in the editorial article referred to (in *THE OPEN COURT*), certain quasi-practical statements may be made.

Agnosticism can have no relation whatever to religion. There have been many theories to account for the variations of the compass. The cause is unknown; it may be unknowable. But what has the Cause to do with religion? Precisely as much as it would have if for the compass we read the Universe. If there be any unknowable—which I do not believe—it may be a god or a gas; but whatever it may be cannot in the least concern the religious nature. For religion is not concerned with a causative agency, but with the character of that agency. Do you say there is a Creator? It is the same as if you say there is a protoplasm, unless you define this Creator. Is it Byelbog or Tchornibog, Ormuzdor or Ahriman? And what is he or it to me, or I to him or it? For any religious purpose there must not only be knowledge, but intimate and complete knowledge. For that reason such abstract and

vague gods as Brahma and Jehovah have no temples or altars; religion follows Jesus, Buddha, Mary, who may be known and loved. Herein religion is actual. Religion can only mean a theory or conception of things on the truth and moral value of which a man bases his life. But this value he can only know by the fruits his religion has borne in the lives and wisdom of certain men. Except as his faith is thus determined by fruits it can have no ethical value even though true. For many a true thing is odious. For example, it is true that in some communities, both of animals and men, the "fittest" to survive is the morally "unfittest,"—the most venomous, furtive, selfish. Religion, therefore, is less concerned about the scientific truth of things than the ideal potentialities of things. This ideal is essentially an expression of the humane standard. Hence to be loved and followed, the Unknowable, like every other god who has excited the religious spirit, must be born of woman. All religious which have gradually de-humanized their deities have become weak. Such are Judaism and Parseism. The great religions,—those which have touched the human heart—have apotheosized some man until he is transfigured with the ideals, and embodies the hopes, of all humanity. There is nothing so well known to us as these ideals and these hopes. What religious or moral relation can man have to the unknowable?

While valuing so highly the attitude of THE OPEN COURT, in the article reviewing the Field-Ingersoll controversy, towards the Unknowable, it would not be candid to omit saying that it does not make clear, to my own mind, the ethical side of Monism. "It takes as its basis the unitary conception of modern science and finds in this view the best support and confirmation of the fundamental truth of religion." The truth at the bottom of all religions, giving them their ethical import, "is the recognition of a moral law in Nature to which man has to conform in order to live, in order to live well, and to be blest." But where is any moral law found in nature except in man? Except in man, and in so much of the world as man has partly humanized, nature seems predatory, and cruelly impartial between good and evil, brier and the fruit—if not, indeed, favorable to the brier. May it not be more truly said that there is a moral law in man to which nature must conform in order to live well and be blessed?

And can it be said that "truth is stronger than error?" I cannot so interpret the crucifixion of Jesus, or the banishment of Buddhism from India, or the present reign of superstition. In three-fourths of the world adherents of error "survive" more comfortably, multiply and increase more extensively, than the disciples of truth. Nor does any tendency to reverse this plainly appear in the nature of things—apart from

the efforts of human science and morality to substitute human for natural selection.

## ECONOMIC CONFERENCES.

### III.

BY WHEELBARKOW.

American Chartism has a very close resemblance to the English article of that name, so close indeed, that listening to Mr. Thomas J. Morgan, who came third in the Economic Conference course, I thought myself once more a boy in London cheering the labor gospel at the Chartist hall in John Street. Mr. Morgan looked like a Chartist, spoke like a Chartist, and the spirit of Chartism was the magnetic string by which he tied the audience together. Mr. Morgan is an effective orator because he has the sincerity and zeal of a fanatic. That is not the worst of it; he is a fanatic with a cause; a fanatic with an argument written in tears.

With some cleverness, Mr. Morgan captured the sympathy of his audience in advance of his argument. He complained that he was only five feet two inches high. The crowd laughed at this, not seeing the subtle charge behind it. They saw it presently when the orator declared with much dramatic force that he had been cheated out of his rightful stature by the rapacity of capital. As he said that, I thought of the cynical Gloucester in the play scolding nature for a like wrong done to him:

"I, that am curtail'd of this fair proportion,  
Cheated of feature by dissembling nature,  
Deformed, unfinished, sent before my time,  
Into this breathing world scarce half made up."

Mr. Morgan 'could not complain that he had been cheated of feature, for his face is well enough; and what there is of him is in fair proportion, but he had been cheated of stature, not by dissembling nature, but by unfair advantage taken of him when a child, prematurely sentenced to hard labor in the factory, where children's hearts are squeezed like grapes and the product sold for gold. All this was mournful enough, but the sympathetic pain of it was felt only by the small men in the audience, men like me, cheated of our stature in the same way. Not so, when he complained of his diminutive social size, for here he touched a chord that vibrated in the hearts of all the men present, who, like himself, were cheated of social stature because they worked for bread. Referring to the slighting way the newspapers always spoke of him, he said: "My social standing and dignity may be measured by the contemptible insignificance of the words 'Tommy Morgan,' and I am a type of the wage class."

Although that preamble was given in a sneering way as if rendering scorn for scorn, there was artful pathos in it, because every working man in the house

was smarting under the low-caste brand stamped upon him by society. Here was a man of character and ability, of earnest convictions, and active philanthropy, whom the newspapers would not allow to rise above the littleness of a nickname because he worked for wages, and had the daring to say things in criticism of society. Notwithstanding Mr. Morgan's manly claim for courtesy, it was refused him by the press; and the next morning the newspapers deliberately repeated the insult of which he had complained; they jeered him again as "Tommy." They saw a sensitive man whom they could wound, and they wounded him. I think the newspaper that thus wantonly violates the laws of social kindness can hardly be called a gentleman. Editors and writers from long habit of criticism sometimes forget the chivalry and charity which will not wound the feelings of other men; a chivalry which in ordinary social intercourse they are careful to display. It is the gentle instinct refined and polished by exercise that makes a gentleman. The possessor of it may be a peasant or he may be a king. He may be an editor also, but in that case his nobility will be reflected in his newspaper. "The hard rain," said Rory O'More, "the hard rain only cuts the body, but the hard word cuts the heart." I have read that much of the cruelty of the French Revolution was vengeance for ancient scorn.

Mr. Morgan's pathos became sarcasm of good quality when he showed the obsequious deferential way in which those papers spoke of the banker, who lectured in the same course on the preceding Sunday night. This contrast marked with double emphasis the ungenerous treatment given to Mr. Morgan. There are not ten rich men in Chicago outside the learned professions who own as much useful knowledge as Mr. Morgan owns. There are not five of them who can weave that knowledge into an argument with such ingenuity and skill as he can do it, and there is literally not one of them who can present an argument in such logical shape, and with such oratorical power as Mr. Morgan presented his reasons for State socialism. Yet, because he is a laborer, he is not allowed the ordinary civilities of life, nor any designation higher than "Tommy." Of all the ills in Hamlet's catalogue, "the proud man's contumely" is the most irritating to the working man.

Mr. Morgan's theme was "The labor question from the standpoint of a Socialist." He built his argument on a platform of statistics, the arithmetic of poverty. Sophistry delights in statistics. They are plastic and accommodating witnesses. Although the proverb says that "figures won't lie," they seldom come into a court of investigation without being successfully impeached. That squalor abounds in all great cities is confessed by everybody. It is not necessary to bring witnesses to prove it. Squalor is the sediment of

cities. Its causes are a thousand, its cures must be as many. Speculative reformers like Mr. Morgan forget this. They have a patent medicine, a magic balsam which cures all political and social disorders. Society must be cured by that or they will not allow it to be cured at all. Like the jealous physician they would rather see the patient die, than cured by any other "school of medicine" than their own. Mr. Morgan sees misery produced by a multitude of causes, yet he has but one remedy, the vague, uncertain hope and promise called State Socialism; wherein all individual ambition is to cease, where no man shall grow taller than his fellow, and especially not more than five feet two inches high. Mr. Morgan looks and speaks like a man who would stand by his principles with consistent heroism. Like Sam Weller's acquaintance who shot himself to prove that muffins were wholesome, Mr. Morgan would rather carry a donkey's load forever than be relieved of his burthen by any other methods than his own.

Men and women who reform the world by wholesale, and who scorn to help their fellow creatures by any retail system, charge all human ills upon society, and relieve mankind from individual guilt. Thus Mr. Morgan transfers the vice of drunkenness from the men who practice it to their form of government. Strong drink, our most efficient poverty-maker, was presented to us rather as a friend of the working man than an enemy; a useful tonic and restorative. Mr. Morgan shifted intemperance from its old position, and made it the effect, not the cause of poverty. This unlucky transposition will have an evil influence over the men who follow his lead, and they constitute a large element of the laboring population of Chicago. We are grateful to the man who unloads our private faults upon the public, but a better friend is he who tells us to reform ourselves now without waiting for changes in the law. Self-discipline is premature, says the flatterer; wait until the State is reformed. Then will be the time to curb your appetites. For the present, comfort your hearts with wine.

After flattering strong drink as a tonic whose office it is to raise the heart of the exhausted worker, Mr. Morgan said: "Give the laborer a chance to get a better home than a couple of rooms. Give men a reason for living and they will not need intoxicants." The applause here had a mendicant flavor about it which was depressing and very sad. The man who comforts himself with "intoxicants" while waiting for "government" or some other benevolent fairy to give him three rooms instead of two, will not have two rooms very long. Whose duty is it to give a man reasons for living? Men must make their own reasons for living, and they must not be expected to share them with the rusty delinquents who think that good

enough reasons for living may be found in beer. Individual ambition, and an active personal conscience are the levers by which the working men must lift themselves. Self-reform is the true tonic of exhausted labor. The man who would elevate society must raise his own part of it, which is himself. A maudlin trust in "government" will accomplish nothing. "Who would be free themselves, must strike the blow." Above all things the working men need freedom from the flatterers who tell them that their vices are not their own.

In like manner Mr. Morgan transferred the sin of laziness from the idler to his external conditions. For this he gave some reasons which society may well examine. He said that idleness existed among the poorer classes because "they were born tired." This bolt struck its mark with the force of a cannon shot. A comprehensive indictment against the existing order of things was condensed into a single sentence. I have often heard it said of lazy men in jest that they were born tired, but Mr. Morgan uttered it seriously as a physiological truth. He said the habitual exhaustion of laboring men and women was transmitted to their children, and that millions of children were tired at the very moment when they came into the world. They inherited laziness. This is a terrible charge against our present social organism, and I fear that Mr. Morgan can bring much evidence to sustain it. In Lord Byron's drama, "The Deformed Transformed," Bertha says to Arnold, her deformed son: "Out hunchback!" and Arnold answers, "I was born so Mother!" In this answer he flings the reproach for his deformity back upon his parents, where indeed it properly belonged. So, Mr. Morgan, confessing the vices of his order, confronts an accusing world, and retorts with bitterness, "We were born so, Mother!" If he is correct, then is our penal code nothing but an expression of legislative ignorance. Whether he is correct or not, his plea of hereditary defect is entitled to grave consideration. It warns us that a little benevolent perfumery sprinkled on the decaying spots of our social system will not disinfect the slums, that we must go down below the surface of our industrial conditions and wrestle with evil in the place of its origin. Men in cloth, and women in silk, wholesale dealers in reform, moralizing against the wind, must work more and talk less. However small the cause of one man's poverty, or of ten men's poverty may be, it is not beneath the dignity of any man who truly desires justice to remove it if he can.

Mr. Morgan showed that in the labor-market there are more sellers than buyers of human muscle and brawn; therefore strikes fail, because there are always unemployed men enough to fill the vacuum created by a strike. Here he threw in a word of pity and apol-

ogy for the "scab." He overdid it, and showed that his own order needed most the pity and the apology. He said, "These alleged idlers are the men termed 'scabs.' They risk losing their lives in the event of securing a job—prefer the abhorrence and detestation of their fellows rather than be without employment." Rather than be without *liberty* is the correct statement. It is not the fear of poverty but the love of liberty that gives that courage to the "scab." The so-called scabs are the nobility of labor, the hope of industrial emancipation. They have been the martyrs of independence in all ages. They are the upright brave who run the risk of death, the abhorrence and detestation of their fellows, rather than surrender their manhood into the keeping of other men. Those who threaten scabs with death, who load them with detestation and abhorrence, should beware how they fling contemptuous names which may rebound upon themselves. The "scab" is a free laborer; the man who can be "ordered out" or "ordered in" by a "chief," a "grand master," or a "walking delegate" is not. I do not speak in reproach, but in sympathy for men driven by despair to bad methods of defence. I have heard that it is written in the law that if two shipwrecked men are clinging to a plank which will only support one man, either of them may drown the other, and the act is not murder; but I do not believe the working-men of America are in any such extremity.

Necessity is the plea offered for intolerance. "Organized labor" says: We have placed our freedom in the hands of trustees, who promise to prop up wages for us by the persecution of all other men if necessary. It is easy to preach on this and show the folly of it. It is easy to censure the cruelty of it, but men who live in haunted houses where the ghost of hunger sits forever on the hearthstone are very apt to be feeble in philosophy and confused about *moral* distinctions. Holding work by a precarious tenure, liable to be idle any day, limited to a small ration of nature's raw materials out of which to make his living, with new inventions daily cheapening skill, it is natural that the mechanic, frightened by the combined adversities that threaten him, clutches at any means of safety, and shoves his neighbor off the plank. In Mr. Morgan's own words, "The worker, realizing by experience the futility of individual resistance seeks in trades-unionism the means of protection." To which I answer, "'Tis true, 'tis true, 'tis pity; and pity it is 'tis true.'" For all this, the laborer must learn that he will never win his own rights by doing wrong to others. He must learn that the laws of justice are binding upon him as upon all other men. Passionate critics, like Mr. Morgan, feeling keenly the rich man's advantage, make no allowance for the millionaire, who may be the victim of his "environment" as helpless as the

laborer in his. They do not see that magnanimity may travel upward as well as downward, and that it is equally due from the poor to the rich as from the rich to the poor. It sounds odd, but few of us know how much the rich need charity.

Mr. Morgan pretends that the laborer's margin of comfort is so small that he has no room for self-denial, and that the luxuries he is called upon to deny himself have already been denied him. He refuted this last Sunday, when he led the working men of the Trade and Labor assembly to resolve against drinking beer for thirty days, as a punishment to the master brewers who were employing non-union men. This bit of self-denial Mr. Morgan approves as discipline for the master brewers, but is not the self-discipline of it a victory more sublime. Trades-union statesmanship never devised a plan for raising wages so effectual as that. By it, every man in the scheme raises his own wages, or saves a wasted portion of it which amounts to the same thing. On Monday, Mr. Morgan said, "I drink but one glass of beer a day, and I quit that last night." This was a wise resolution unless Mr. Morgan intended to increase his daily allowance, because if the tired working man needs beer to tone him up and keep him going, one glass of it per day is not enough, and if he does not need it, one glass is evidently too much. Mr. Morgan raises his own wages five cents a day. Not much indeed, but it amounts to a suit of clothes a year, which to a working man is considerable in this climate.

According to Mr. Morgan there are four acts in the evolution drama, barbarism, feudalism, individualism and socialism. We are now near the end of the third act, and individualism has possession of the stage. The arrangement is purely fanciful, and if the order were inverted it would be just as true. Is not State Socialism a quality of barbarism? I don't mean a bad quality, for many philosophers of high rank look upon State Socialism as a redeeming virtue in the political system of the Indians. Is it not error to think that individualism prevails even in the United States? Here every citizen has a legislature in almost continual session embracing him, petting, patronizing and protecting him. Sometimes two legislatures are affectionately squeezing him at the same time, and like a brace of benevolent garroters, literally "holding him up." Is it not the dream of every citizen that congress has the power to make prosperity? And many actually believe that Congress can make money. It is the chronic state of every man in this country that he "wants to have a law passed." What sort of individualism is that?

Mr. Morgan appears to be jealous of specific reforms. He prefers to see injustice breed injustice, and wrongs multiply. He thinks that after a fruitless

march of calamity, the people in despair will turn to State Socialism for prayer and rest. The prospect for labor is not bright when leaders like Mr. Morgan, "hail with delight the organization of every corporation, pool or trust that monopolizes production, communication, distribution, transportation or exchange." There is an unfortunate cabman in the lunatic asylum, who, although sane on other subjects, thinks that the nearest and best way to anywhere is across the great desert of Arabia. In his efforts to go by that route he caused his passengers much inconvenience. Mr. Morgan desires to conduct the working men to a better social state, but he insists on taking them there by way of the Arabian desert.

#### THE ONENESS OF MAN AND NATURE.

Mr. Moncre D. Conway's friendly criticism (on page 1105 of THE OPEN COURT) is a welcome challenge to explain more fully than has been done heretofore "the ethical side of Monism." According to Monism man is a part of Nature, a part of the one great All, and the ethical import of Monism is based on the recognition of this idea of oneness. The barrier which in the opinion of dualistic systems existed between the *ego* and the rest of the world is broken down. The individual belongs to the whole as an integral part of it. The more fully, the more correctly and truly the cosmos\* of the Universe is mirrored in a consciousness, the closer will be the union of the *ego* with the All and the more moral the individual must become. The better a man understands the true connection of his soul to the souls of his fellow-beings and the better he comprehends his right relation to the great whole of all-existence, the more will he conform to what he calls the laws of sociology and the moral rules of conduct. And the more he conforms to these conditions, the fitter he will be to survive in the struggle for existence.

This in large outlines the ethical aspect of Monism, and this is the character of evolution also. The ethics of Monism can fitly be named Evolutionism, for evolution is possible only because the laws of the world in which we live are a moral power. The Cosmos itself, the order of the world, is the foundation of morality. Properly speaking, we cannot say that the All is moral. This is an anthropomorphic expression, which, in poetic speech, may be allowable but is not correct. The truth is individuals are moral in so far as they conform with the Cosmos, in so far as they become one with the All and conform to its order, or humanly speaking, as they obey the laws of the whole.

From the monistic standpoint man is the highest product of the All. Man is the blossom on the tree

\* Cosmos literally translated means order.

of Nature, and humanity is its fruit. Man is grander and nobler than the rest of nature, as the blossom is a higher stage of evolution than the leaf. But a flower and a leaf, though they may be contrasted as the higher and lower stages of one and the same plant, cannot be considered as two essentially different beings. Thus human civilization, and the vegetable and animal kingdoms can be viewed under the aspect of opposites but not as contradictions. Both are products of the same tree, both are natural, and we shall find that in human society the same fundamental laws are at work as in the other natural kingdoms. Man by his higher qualifications conforms more quickly and readily to these laws. There is more truth in his conception of the universe than in the imperfect percepts of animal brains. Therefore he is more powerful, therefore he is more moral and therefore fitter to survive in the struggle for existence.

These facts cannot be denied when we observe how man takes possession of the earth and how brutes and wild beasts are extirpated; how also among men the savage races die out, while the civilized nations conquer the world. And yet it is an every day's experience that the morally bad triumph over the good, and that the honest are worsted by the wicked. The possibility of falling into error is greater than that of hitting the truth; accordingly while one truth is born, hundreds of errors have occasion to arise. Errors multiply quicker than truth and the briers seem more fertile than the useful fruit-trees.

The truth of this is obvious, although the potency of wickedness seems to contradict flatly the former statement that morality makes man fitter to survive. Similarly the fertility of error seems irreconcilable with the fact that truth is stronger than error and must survive in a world where the fittest will finally conquer. And if we experience, ourselves, the power of iniquity, if we personally suffer from the advantages which the wicked gain by their very unscrupulousness, we are but too much inclined to lose all confidence in the moral order of the world.

There have been and still are times of trial and tribulation in the development of entire nations as well as of single individuals, when it takes all our strength not to lose faith in ethics and in the worth of ethics. Even Christ cried in the agony of death his *Eli, Eli, lama sabachthani*. "My God, my God, why hast thou forsaken me?" All the sages of humanity agree that it takes a strong character and the moral power of purpose, faithfully to endure in temptation and constantly to trust in truth and righteousness. There is sufficient cause for a lack of faith, and enough occasion for following the path of vice and wrongdoing. Almost all aberrations from truth and justice appear pleasant and full of promise in the

start, and the warnings of parents and teachers are easily forgotten. Nevertheless these aberrations lead to inevitable ruin, and although the righteous path may be thorny now and then, perhaps too often for our taste, we should nevertheless, difficult though it may be, never lose faith in the final triumph of truth and justice.

The spirited shepherd boy who became king of Judea sings in one of the psalms:

The wicked in his pride doth prosecute the poor.

His mouth is full of cursing and deceit and fraud: under his tongue is mischief and vanity.

He sitteth in the lurking places of the villages: in the secret doth he murder the innocent: his eyes are privily set against the poor.

He lieth in wait secretly as a lion in his den: he lieth in wait to catch the poor: he doth catch the poor, when he draweth him into his net.

He croucheth, and humbleth himself, that the poor may fall by his strong ones.

He hath said in his heart, God hath forgotten: he hideth his face; he will never see it.

And in another song the royal Hebrew poet gives an answer to his anxious doubts as to the apparent lack of justice in the order of the world. He says:

Fret not thyself because of evildoers, neither be thou envious against the workers of iniquity.

For they will soon be cut down like the grass, and wither as the green herb.

Cease from anger, and forsake wrath: fret not thyself in any wise to do evil.

For yet a little while, and the wicked shall not be: yea, thou shalt diligently consider his place, and it shall not be.

But the meek shall inherit the earth; and shall delight themselves in the abundance of peace.

The wicked plotteth against the just, and gnasheth upon him with his teeth.

The wicked have drawn out the sword, and have bent their bow, to cast down the poor and needy, and to slay such as be of upright conversation.

Their sword shall enter into their own heart, and their bows shall be broken.

A little that a righteous man hath is better than the riches of many wicked.

The wicked borroweth, and payeth not again: but the righteous sheweth mercy, and giveth.

I have seen the wicked in great power, and spreading himself like a green bay tree.

Yet he passed away, and, lo, he was not: yea, I sought him but he could not be found.

I have been young, and now am old; yet have I not seen the righteous forsaken, nor his seed begging bread.

Depart from evil, and do good; and dwell for evermore.

The righteous shall inherit the land, and dwell therein for ever.

David finds comfort in observing the eventual fate of the prosperous evil-doer, for "a little while" and "he passed away, and, lo, he was not."

The triumph of truth and virtue, however, is not such as to make their devotees wander through the pleasant vales of perpetual happiness. Just the con-

trary; the path of virtue and truth is often not easy to find and difficult to walk upon. "Strait is the gate and narrow is the way which leadeth unto life and few there be that find it." Similarly the Greek poet says:

Τῆς δ' ἀρετῆς ἰσθμὸς θεοὶ προσέθεντο ἰσθμῶν  
Ἀθανάτοισ' ἄσπερος δὲ καὶ ἠρώδης ἄβυσος ἐπ' αὐτῇ.

[Toil before Virtue is placed by judicious decrees of Immortals. Steep is the path to her heights and rugged the road to the summit.]

The evil consequences of error, folly, and crime, it is true, often come so slow that it appears as if the sinner would escape punishment. They come late, yet they are sure to come, as a Greek sage has said:

ὁπλ' αἰὼν ἀλέουσι μένος, ἀλέουσι δὲ λεπτά.\*

"Though the mills of God grind slowly,  
Yet they grind exceeding small;  
Though with patience he stands waiting,  
With exactness grinds he all."†

The simple narrative of the crucifixion of Christ has impressed humanity so deeply because of the moral lesson it conveys. The most touching and sympathetic features of the holy legend must be found in the suffering which the God in man has to undergo. The divinity of man is a source of intense pain and tribulation. Our very ideals lead us into trouble and temptation and even into the darkness of death. And yet we should not despair; we should preserve our faith in truth and righteousness. It is this lesson which made of the tragedy of Golgotha, a gospel and glad tidings to the struggling and despairing human race.

It is true, that with the new revelation of Christianity *per crucem ad lucem*, which showed that the path of righteousness leads through suffering, and that only a crown of thorns can become a crown of glory—errors arose which retarded or seemed to retard the general progress of truth. The same had happened to Buddhism. Its true ethical idea was soon overgrown and smothered by errors. Buddha himself and in a similar manner Christ himself opposed the dualistic and pessimistic conceptions of their forerunners. Both opposed fasting as injurious to body and soul, both left the abodes in deserts and abandoned monkish habits. They lived as men among men, they sat down at table and ate and drank with the sinners. The disciples of St. John therefore began to grow doubtful as to the divine mission of Jesus. They sent word to him and asked: "Art thou he that should come or do we look for another?"

Christ, as well as Buddha, represents a reaction against pessimism. It was the start of a new faith, a new hope, a new religion, a religion that should bear

the features of meliorism. These melioristic features in Christian ethics which beam forth in Faith and Hope and Charity, have been the strength of Christianity and did most for its propagation. It is the Christian faith which conquered the world, not the pessimistic and world-despising despair of its dualism.

The tares grow with the wheat, and errors freely sprout where a new truth is conceived. Errors multiply and increase more luxuriantly than does truth. And yet it is only for a while; they will pass away and truth will stand forth victorious.

It was again the Christian faith, the melioristic feature of Christianity, which proved a regenerative power in the time of the Reformation and led humanity one step nearer to a monistic, a unitary, and harmonious conception of the All. It is faith in ethics and confidence in our ideals which, by an abandonment of creed, will lead humanity to the purer heights of a nobler conception of life and a more elevated existence on earth.

The ethical aspect of Monism has been brought to light more strongly by the recent investigations of experimental psychology, which have been instituted in France by Mr. Th. Ribot and other French savants. The modern psychology of Mr. Ribot agrees well with the monistic view which has been propounded by German scientists. The dualistic conception that there is at the bottom of the soul such a thing as an *ego*, has been proved to be wrong. The *ego*, or the state of consciousness, is not the cause of our mental life, it is the result of the innumerable and complicated nerve-organisms in our brain. The ideas we think are the elements of which our mental life consists. Our mind is *de facto* a republic of thoughts, of which now the one and now the other is called into activity. The unity of mental activity, says Wundt, is no proof of Des Cartes's view that the soul is a simple being; for the unity of the mind is now considered as resulting from a rich and complicated system.

The *ego* of our consciousness is concentrated and centralized, according to Mr. Ribot, in a similar way as our sight is focused in the lenses of our eyes. This modern psychological view has been explained by Mr. Hegeler\* in its mechanical aspects; and Prof. Mach compares the personality of an individual to an indifferent symbolical thread on which are strung the valuable pearls of our real existence.† These pearls are the ideas which have entered into our brains. The ideas which live in us are our true self. These ideas we have received from others and we communicate to others. These ideas, in so far as they are ideals, warm our hearts and keep aglow our enthusiasm so as to

\* Sextus Empiricus.

† The English version by Longfellow is a translation of Friedrich von Logau's epigram:

Gottes Mühlen mahlen langsam,  
Mahlen aber trefflich klein;  
Ob aus Langmuth er sich skumet,  
Bringt mit Schärfe Alles ein

\* In Nos. 1 and 11 of THE OPEN COURT.

† Prof. Ernst Mach, "Transformation and Adaptation in Scientific Thought," Part II, to be published in No. 48 of THE OPEN COURT.

make life worth living, for life is only worth living if we aspire towards something that is greater and nobler than our limited *ego*. These ideas in so far as they are the essence of what we call humanity, make of every single man a representative of mankind.

Thus the barrier between the *ego* and the great whole of the All is broken. Prof. Mach\* says: "Humanity in its entirety is like a poly-p-plant. The material and organic bonds of individual union have, indeed, been severed; they would only have impeded freedom of movement and evolution. But the ultimate aim, the psychical connection of the whole, has been attained in a much higher degree through the more luxuriant development which has been thus made possible."

The individual man is ethical by his Oneness with humanity, and humanity is ethical by its Oneness with Nature. If humanity would cut itself loose from Nature in which its origin lies and which affords the condition of its existence, it would die away and wither like a tree that is severed from its root. Humanity as a whole as well as the single man can live and grow, advance and prosper only by remaining one with the All, by being moral; i. e. by observing and conforming to the cosmical order of Nature.

## CORRESPONDENCE.

### THE ETHICAL BASIS OF CHARITY.

To the Editor of THE OPEN COURT:—

Allow me to take exception to a point in "The Ethical Basis of Charity" by W. Alexander Johnson. I almost hate to do so, because I sympathize heartily with the idea put forth in the article as a whole. But, on the other hand, just for that, I take the liberty to criticise what seems to me a bend from the right road, which the author in his paper so masterly pursues.

Mr. Johnson says: "The law of the 'Survival of the Fittest' is without doubt the law of progress in animal life." Now then, this is an error, which is not made smaller by being met with rather often, and which must not be passed by unnoticed, because of the important course of ideas it involves. There is at the bottom of the error an identification of the "fittest" and the "best." But the competition in life or the struggle for existence is very far from being of so teleologic a nature or of so soft grained a turn. Charles Darwin in his work on the Origin of Species, says about extinction: "It is certain that insects and blood-sucking bats determine the existence of the larger naturalized quadrupeds in several parts of South America." (P. 295.) Thus, there is very little grace in nature. And I must object as much to the premises of Mr. Johnson that the law of the "Survival of the Fittest" has not unhindered operation in its application to humanity as to his conclusion that if it had, pauperism would speedily come to an end. He says: "Every pauper would have choice of three resources: he could work, steal or starve; he could no longer live by beggary." But this is an error, and an error which was in a very ingenious way pointed out by Mr. Johnson in the very article under consideration. There is for the pauper one more opening, and that is the senseless charity which Mr. Johnson blames; but which,

as a fact, enters into the struggle for existence, and is precisely the doleful circumstance which favors the lazy and low-minded, and like the vermin of South America, in their competition with better animals, makes the parasitic life they depend on more successful than that of many of their betters.

As I hinted before, it is a common error to misunderstand the law of the survival of the fittest, by identifying the fittest with the best. But this interpretation seems to me a very dangerous relapse into teleological optimism, which is as theoretically untrue as it is practically misleading, favoring all the deplorable *vis inertiae* of our moral faculties. The struggle for existence and the competition in life are a fact, and a brutal one at that, but not a nice arrangement of a more or less transcendental cosmical order which settles all for the best and which we can abide by. Whosoever has tried to cultivate a garden, or raise "live stock"—no matter what kind—and whosoever reasons, like Charles Darwin himself, with the knowledge of facts gained there before him, can not be one moment in doubt, that in this world of ours the "fittest" to live is very often not a very ideal individual.

DR. LINDBORME.

[Mr. Johnson has declared in his essay published in No. 37 of THE OPEN COURT that the basis of Charity must not be sought for in the sustenance of a pauper class which proves to be unfit in the struggle for existence, but in ourselves and our ethical nature.]

Dr. Lindorme, undoubtedly gives expression to the general opinion which is at present most popular. We do not hesitate to side with Mr. Johnson, not because we know the able editor of the *Reporter*, the Chicago organ for organized charity, to be an authority in this province, but because his evidence is coercive and unanswerable. It rests on the solid basis of scientific facts. If charity organizations would offer a constant help to those unable to help themselves, they would induce a large number of people to rely upon their help. They would raise and pamper a pauper class as has been done in Italy and other countries where charity has been practised with a vengeance and where its pernicious effects are felt in degrading the working class by lowering the standard and average price of free labor.

It is maintained that the fittest, not the best, survive. This is true in exceptional cases, but not in the whole. The morally bad may enjoy great advantages for a long time, and many of the good will perish as their victims, but in the long run the morally bad are sure to perish and only the good can survive.

It is not uncommon to undervalue the import of morality in the struggle for existence, and we took occasion on p. 906 of THE OPEN COURT, to state our view of the subject in opposition to Prof. Huxley, who in his essay of the *Popular Science Monthly* for April had stated that not the best but the shrewdest and toughest survive.

We said in the passage alluded to "Man survived not because of his toughness, or his shrewdness, but because of his moral qualities. The antediluvian fox was perhaps shrewder, and the lion or bear tougher, than the prehistoric savage or man-ape; but they were lacking in the moral faculties which bind single individuals together with the ties of love, of family and of friendship. Moral feelings, or rather the capacity and conditions of the growth of moral feelings, the tendency to reveal moral qualities, made the primitive man sociable. A social animal develops more morally than solitary beings, and the shrewdness of a social being becomes intelligence.

"Intelligence is more powerful as a weapon in the struggle for existence than shrewdness, because it does not lack in morality. Human speech is the product of intelligence and not of shrewdness. Man was able to develop speech only because he was moral enough to be social, and this morality elevated man above the rest of the animal world. Among savage tribes the most intelligent, and not the shrewdest, survived. It is an undeniable fact that in any given district the tribes who were lacking in morality, even

\* Prof. Ernst Mach, "Transformation and Adaptation in Scientific Thought," Part II, to be published in No. 48 of THE OPEN COURT.

when the very shrewdest and toughest, had to go to the wall, while in the end the most moral remained victorious.

"It is a wrong historical view to imagine that the Romans conquered the world because they were shrewder, stronger and more ferocious than their neighbors. They conquered the world because they possessed in addition to strength a rare moral quality—the quality of justice. And even their strength was not the physical force of a ferocious bull, but the moral strength of courage.

"It will thus be seen that morality affords the power to survive, and if the primitive savage was not moral in the present acceptance of the word, he was in his time relatively the most moral being on earth, and this gave him more strength than toughness or shrewdness could ever afford."

We refer the reader to the editorial of the present number, where this subject is more fully discussed. [EDITOR.]

#### NOTES.

Herbert Spencer is working again, though with difficulty, for he says it took him from the middle of March to the first of June to write the article on "The Ethics of Kant," which he will contribute to the August *Popular Science Monthly*. Mr. Spencer combats Kant's idea that only right things done in obedience to duty have moral worth, while the same things done from love of the right in and for itself are morally valueless.

The *Revue Philosophique* for July contains a translation of the above mentioned article *La morale de Kant*.

Our German-American compatriots have again proved their National and true American spirit by a new publication, entitled *Deutsch-Amerikanische Dichtung*, which is published monthly in Newark, Ohio, and New York, (14 Cooper Union). It contains the poetry of German-American poets, and is well edited by Konrad Nies. Contributions from the best German-American authors have appeared in its columns. Number 6, which is just published, contains poems by E. A. Zuendt, Hermann Rosenthal, Max Hempel, Kara Giorg, Ilda Poesche, Adolph Hachtmann, G. Fr. Bauer, and Konrad Nies, the editor. Mr. H. Urban has contributed a short novel.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XIX.—Continued.

All three stood still; the spoons fell into the grass. "We are betrayed," cried Siddy, turning pale. "Away with you, Victor."

"I am an officer, and dare not run away," he replied, shrugging his shoulders. He seized his sword and hastily fastened it.

"You must take it all upon yourself," Benno, exclaimed the sister.

"I would willingly do it," replied he, timidly, "but I have never had any skill in invention."

The Prince dismounted in front of the farm-house, helped by his equerry. The lackey hastened forward to open the doors, and the Prince approached slowly like a threatening storm. He entered the garden, and his sharp eyes rested on the embarrassed Prince and Princess, who stiffly made their obeisances to him.

An ironical smile curled his lip when he saw the dishes on the table. "Who has arranged this country

carnival?" he asked. All were silent. "Answer, Benno," he said, turning sharply to the young gentleman in the blue smock-frock.

"Siddy and I wished to have a little pastime in the meadow before she left our country. I spilled some water over my sister, and she was obliged to change her dress."

"Where is your lady in waiting, Sidonie?" he asked his daughter.

"I begged her to go to her aunt who lives in this neighborhood, and to return in an hour," replied the Princess Sidonie.

"She has not done right in forgetting my commands, in order to gratify yours; and she neglected her duty in exposing the Princess to such an adventure. It is not fitting that princesses should enter village houses alone, and disguise themselves."

The Princess compressed her lips. "My gracious lord and father, forgive me. I was not alone. I had the best protector with me that a princess of our house could have, that was your Highness's son, my brother."

The Prince drew back a few steps, and looked silently into her face; and, so strong was the expression of anger and displeasure in his countenance, that the Princess turned pale and cast down her eyes.

"Has the Princess appointed Prince Victor to be her protector in the peasant's farm?" he inquired. "Has Lieutenant"—he mentioned his family name—"permission to leave the garrison?"

"I came here on horseback without permission," replied Victor, with military composure.

"Report yourself under arrest," commanded the Prince.

Victor saluted and turned away. He unfastened his horse, and, nodding behind the Prince's back, over the hedge, to his cousin, he trotted back to the town.

"Make haste and cease this mummerly," ordered the Prince. "The Princess will drive home in a carriage with the Hereditary Prince."

The young people made their obeisances and left the garden.

"I had a foreboding of this misfortune," said the Hereditary Prince, to his sister, when in the carriage. "Poor Siddy!"

"I would rather be the maid of this countrywoman, and wear wooden shoes, than continue to bear this life of slavery," cried the angry Princess.

"But do not make any remarks at dinner," begged Benno.

The nosegay of wild flowers stood in the bucket, and was torn to pieces in the evening by the countrywoman's cow.

\* \* \*

The day following, the Lord High Steward, von Ot-

\* Translation copyrighted.

tenburg, an old gentleman with white hair, entered the apartment of the Prince.

"I have requested your Excellence to call on me," began the Prince, politely, "because I wish to obtain your advice in a family matter. The day approaches when the Princess will leave us. Have you seen my daughter to-day?" he said, interrupting himself.

"I come from her Highness," answered the old gentleman respectfully.

The Prince smiled. "Yesterday I had to speak seriously to her. The children took into their heads to act an idyl, and I found them in peasants' dresses and in high glee. Our dear Sidy had forgotten that such sport might expose her to misinterpretation, which she has every reason to avoid."

The Lord High Steward bowed in silence.

"But it is not a question of the Princess now. The time has arrived when a decision must be made concerning the next few years of the Hereditary Prince's life. I have thought of his entering one of the large armies, in spite of the consideration due to his delicate health. You know that there is only one empire in which this is possible, and even there unexpected difficulties have arisen. There are two regiments in which one might be certain that the Prince would only have familiar intercourse with the officers of high birth. One of these regiments is commanded by Colonel Kobell, who quitted our service some years ago. It is not fitting to make the Prince his subordinate. In the other regiment an unexpected occurrence has taken place within this last month. A certain Mr. Miller has been introduced into it, contrary to the wishes of the corps of officers. Thus the Hereditary Prince is debarred from belonging to the only army which he could enter."

"Allow me to ask whether this second hindrance might not be removed?" said the Lord High Steward.

"They would gladly do anything to please us," replied the Prince, "but they do not know how to manage it; for the appointment of this unaristocratic lieutenant was made for political reasons."

"Could the difficulty not be removed by giving rank to the family of the lieutenant?" suggested the Lord High Steward.

"That has been cautiously tried, but the father would not consent; and, indeed, your Excellence, the objection would remain the same. You know that I am not a purist in these things, but daily intercourse with such a person would be unpleasant to the Hereditary Prince. Whether Miller, or Von Miller, the dust of the flour would remain."

There was a pause. At last the Lord High Steward began: "The advantages of a military career are certainly undeniable for young princes who have no means or chance of finding other active employment;

but is this course advisable for a future sovereign who needs a preparation for a great career? I remember that in former times your Highness did not take a favorable view of a soldier's life at Court."

"I do not deny that," replied the Prince. "I must acknowledge to you that I still take this view. The usual condition of society is not now that of war, but of peace. The necessary training of a young prince for war undoubtedly develops some manly parts of his character, but delivers him helplessly into the hands of his officials in all essential matters. In confidence, your Excellence, a pleasure in epaulets lasts just during the time of peace; but in case of a great war, where real military talent is requisite, the military dilettanteism of princes, with few exceptions, turns out to be quite useless. All this is undeniable. Unfortunately it is at present no longer fashion that determines a military career for young princes, it is a serious necessity. The times in which we live are such that a strict connection between the Court and armies is inevitable; and what at one time was thought to be unnecessary is now the support of princes."

"I do not see that the position of reigning princes is strengthened by their being bad generals," answered the Lord High Steward. "Indeed, I venture to assert that many of the difficulties which now occur between princes and their people arise from the fact that our princes occupy themselves too much with the shoeing of horses, the training of recruits, and with the prejudices and ill conduct of garrisons, and have too little of the firmness, noble pride, and princely feeling which can only be developed by practice in worthier affairs."

The Prince smiled. "Your Excellence, then, is of the opinion that the Hereditary Prince should visit the University, for there is no other mode of training when he leaves this Court. The Prince is weak and easily led, and the dangers he would incur on this path are still greater than intercourse with officers of inferior grade."

"It is true," interposed the Lord High Steward, "that during the next few years the Hereditary Prince may find certain drawbacks in the advantages of an academy; but with respect to personal intercourse, there are sons of ancient families who are worthy of the honor of associating with the Prince. It would perhaps be easier there for the young gentleman to keep clear of unsuitable society than in a regiment."

"It is not this danger which I fear for him," replied the Prince; "but the unpractical theories and disturbing ideas which are there promulgated."

"Yet we should learn what one has to battle against," rejoined the Lord High Steward. "Does your Highness think, from the varied experience which you have attained through a highly intellectual

life, that an acquaintance with these ideas is so dangerous?"

"Does a person go to hell in order to become pious?" asked the Prince, good-humoredly.

"A great poet having ventured this," replied the Lord High Steward, "wrote his divine poem; and my gracious lord, who himself has always preserved a warm interest in learned pursuits, considers our Universities at best a species of mild purgatory. If an infernal flame should cling to the soil of our illustrious Prince after his return from this place, it will soon be eradicated by the high interests of his princely calling."

"Yes," assented the Prince, with lofty expression, "there is a consecration in the office of princes which fits even a weak man for the great interests which he has to grapple with through his life. But, your Excellence, it is difficult to observe without contemptuous pity the sentimental fools' paradise of the new rulers, and hear the old phrases of love and confidence believed in and spoken of by princely mouths. Undoubtedly these popular ebullitions are transitory, and many of us older ones have once indulged in dreams, and endeavoured to plant green moss where it has been withered by the sun; but the fearful dangers of the present times make such wavering more dangerous to the new rulers, and false steps in the beginning of a reign may often ruin the position of the ruler afterwards."

The Lord High Steward replied apologetically: "It is perhaps well to be wiser than others, but to be more moderate is at no period advantageous. Still a little poetry and youthful enthusiasm may be allowed to our princes; and if I therefore venture to recommend a visit to the University for his Highness, the Hereditary Prince, it is with the satisfactory feeling that in doing so I express your Highness's own opinion."

The Prince looked sharply at the Lord High Steward, and a sudden cloud passed over his brow. "How should you know what my secret thoughts are?"

"That would be quite a vain attempt with your Highness," replied the old courtier, gently, "and it would little benefit an old servant to spy into the secret thoughts of his master. But your Highness has always hitherto given the Hereditary Prince tutors and attendants who were not military. This leads every one to a conclusion respecting your Highness's wishes."

"You are right, as always," said the Prince, appeased. "It is a pleasure to me to find that your views coincide with mine. For it is a serious decision that I have to make; it robs me for a long time of the company of my dear Benno."

The Lord High Steward showed his sympathy by

a silent bow. "Your Highness's decision will undoubtedly produce great changes, for it will at the same time remove all the young people from the Court."

"All?" asked the Prince, surprised. "The Hereditary Prince will depart shortly after the marriage of his sister, but Prince Victor will still remain here."

"Then I humbly beg your pardon," rejoined the Lord High Steward. "I had taken for granted that the departure of the Hereditary Prince would be followed by the entrance of Prince Victor into a foreign army."

"What makes you think that?" said the Prince, with surprise. "I have not the least intention of providing for Prince Victor abroad; he may practice the art of riding in our squadrons."

"In this case his position at Court would be changed," said the Lord High Steward, thoughtfully; "on occasions he would rank and act as the representative member of this illustrious house."

"What are you thinking of," my Lord High Steward?" replied the Prince, captiously.

"Will your Highness graciously explain how that can be avoided? The rights of blood can never be given or taken away. The Prince is the nearest relative of the Royal Family, and the rules of the Court require a corresponding position, and the Court will insist that he be not deprived of it."

"The Court!" exclaimed the Prince, contemptuously; "You might as well say at once, the Lord High Steward."

"The Lord High Steward is appointed by your Highness to watch over the regulations of the Court," replied the old gentleman, with solemnity. "But as my personal opinion, I venture to suggest that service in this capital and the proximity of the Court are not advantageous for the active and energetic spirit of Prince Victor; it may be foreseen that your Highness will often have occasion to be dissatisfied with him, and that the loss of your Highness's favour, considering the lively and popular character of the Prince, may give occasion to continual scandal and malicious talk. Therefore I venture to assume that the considerations which hinder the military career of the Hereditary Prince in a foreign army will have no weight as regards Prince Victor."

The Prince looked down moodily. At last he began, as if convinced: "I thank you for having called my attention to these considerations: I will come to a decision after mature deliberation. Your Excellence may be satisfied that I know how to value the warm sympathy you take in me and mine."

The Lord High Steward bowed and left the room; the furrows deepened in the face of the Prince as he looked after the old man.

The consequence of this conversation was that the Hereditary Prince was sent to the University, where the event did not create so much commotion as was expected at Court.

The Rector, one evening, came to Professor Werner, and after greeting Ilse, began, "You set a good example to your country when you came to us; a communication has been made from head-quarters to the University that in the next term your Hereditary Prince will begin his studies with us." Then, turning to the Professor, he continued: "It is expected that we shall all do that we can, compatibly with the duties of our office, to advance the education of the young Prince. I have to convey to you the wishes of his Highness that you should lecture to the Hereditary Prince in his own room."

"I shall give no Prince's lectures," replied the Professor; "my branch of learning is too comprehensive for that; it cannot be put into a nutshell."

"Perhaps you could lecture on some popular theme," advised the prudent Rector. "It appears to me that greater value attaches to the beneficial effect of your personal intercourse with the Prince than to the contents of your lectures."

"If it is agreeable to the Prince to be in our house, and he will accommodate himself to our habits, I shall show him every respectful and fitting attention. But in my course of instruction I shall make no change on his account. If he attends my lectures as a student, well and good; but I will never give any private lessons in his room or in that of any one else."

"Will not your refusal be regarded as an incivility?" rejoined the Rector.

"It is possible," replied the Professor, "and I must acknowledge to you that in this case it is particularly painful to me. But no personal consideration shall induce me to give up a principle. I have formerly experienced how humiliating it is to have to fashion and fit a serious subject to the comprehension of a boy who has not the necessary preparatory knowledge and the power of grasping and taking a real interest in it. I shall never do it again. But I will do all that I can for this young gentleman, although I must confess that my studies lie far from the high road of princely education. If they wish to learn of us what may be profitable for their future life, they must do so in a regular way, and they should come to us with the preparatory knowledge which alone will make it possible for them to derive advantage from learning. I have here and there observed from a distance how sad is the education of most of them. The shallow and superficial nature of their training, which renders it almost impossible for them to take a warm interest in any domain of intellectual labor, is also of little value for their future life, and gives them little capacity for

their duties as rulers. We participate in inflicting this injury, if we impart a mere varnish of learned culture to youths who have not in truth as much knowledge as a freshman. And that is usually the object. It is not necessary to visit the University in order to become a useful man; but if one enters this difficult path—and I think undoubtedly that every future ruler ought to do so—it should be in a way that will secure valuable results. I do not condemn the teachers who think otherwise," concluded the Professor, "there are undoubtedly subjects in which a succinct presentation of some of the leading principles is possible and profitable. But the study of ancient learning is not of this class, and, therefore, I beg to be excused from giving private lessons to the young Prince."

The Rector expressed his approbation of these principles.

"My poor Hereditary Prince," cried Ilse, pityingly, when the Rector left.

"My poor manuscript," retorted the Professor, laughing.

"But you have made an exception in favor of your wife," rejoined Ilse.

"Here the instruction is only the guide to the elucidation of our whole life," replied the Professor. "Under these circumstances, you will be able to contemplate only from a distance the future Sovereign of Bielstein as belonging to you; and I shall also lose certain faint hopes which I had built upon the passing acquaintance with my father. For it is undoubtedly probable that my refusal will be considered as an act of capricious pride."

The Professor might have been at ease upon this point. Care would be taken that his views should not reach the destination for which they were intended. The sharpness would be blunted, the point broken, for indeed in the higher regions such an idea would be considered so monstrous that it could only be put down to the account of a reprobate man; and this was by no means the case with the Professor.

The Rector was cautious enough to give plausible reasons for Werner's refusal, and at the Prince's palace it was determined that the Hereditary Prince should attend the Professor's lectures. From a syllabus of Werner's lectures a course was selected; it was on the inspection and explanation of casts of antique sculpture, during which the Hereditary Prince and his attendant had at least not to sit among a crowd of colored caps, but could wander about in princely isolation.

*(To be continued.)*

Doubtless all souls have a surviving thought;  
Therefore of Death we think with quiet mind;  
But if we think of being turn'd to nought,  
A trembling horror in our souls we find.

—Sir J. Davies.

## MISCELLANEOUS.

Prof. Alb. H. Gunlogsen, a native of Iceland, was educated at Copenhagen and Rome. He began his study of Sanskrit and Comparative Philology at the University of Naples, under Prof. Lignand, whose tuition Mr. Gunlogsen enjoyed from 1861-66. Mr. Gunlogsen subsequently completed his study of Sanskrit under Prof. Goldstricken of University College, London. Prof. Gunlogsen afterwards acted for several years as Teacher of the ancient and modern Languages in a number of private Schools and Colleges in and near London, England, at the same time occasionally writing essays and translations for a number of British Reviews and Newspapers. Prof. Gunlogsen came to this country in the year 1880. During this interval he has mainly been engaged in teaching the ancient and modern Languages, contributing from time to time short essays and sketches to various American Newspapers. He has translated several articles for Scientific Cyclopedias, etc. Mr. Gunlogsen is the first man who has ever ventured to teach Sanskrit in the City of Chicago. The winter before last he was able to form a small class consisting of four Professors of the North Division High School. Mr. Gunlogsen will continue to teach Sanskrit in Chicago during next winter. In his teaching he follows the Text books introduced by American Sanskrit scholars. Lanman's Reader and Perry's Primer and Prof. Whitney's Grammar.

We have for some time been in receipt of a paper by Mr. Frederick Gerbard of New Jersey, entitled: "*Should the Death-Penalty not be abolished in those States of the Union where it is still in vogue?*" which we take favorable opportunity to present in extracts. Mr. Gerbard reviews the history of the abolition of the death-penalty in these words: "The first step of the abolition of death-penalty was made in 1764, by the celebrated Italian criminal-lawyer Beccaria, the champion against capital-punishment, by proving that this penalty had never deterred criminals from inflicting harm upon society. But a long time elapsed before his endeavors bore the first fruits. In Tuscany the death-penalty was abolished in 1786, and in Austria in 1787. It was, however, re-enacted in Tuscany, in 1852, but this roused such a storm of indignation, that the Government found itself forced to annul it once more. In Austria it was also re-enacted. In Germany the National Assembly of 1848 passed a resolution of abolition, which was put into effect in Oldenburg, Bremen, Nassau, Anhalt and the Kingdom of Saxony, but not permanently; for, at the establishment of the German Empire, when the reaction gained full power that resolution of the National Assembly of 1848 was annulled; and, since that time, intelligent Germany can again be proud of the fact that in its domain murder will again be committed *de jure*. In Switzerland the death-penalty has been abolished in several Cantons, but has been re-enacted in some of them. In Holland it was abolished in 1870; and the same has been done in Portugal, Belgium and Roumania. Among the states of the American Union it was abolished in 1846 in Michigan, in 1852 by Rhode Island, and in 1853 by Wisconsin. The remaining states and the remaining foreign countries have not yet been able to attain the moral elevation requisite for this act of humanity, though in the States of Maine, Minnesota, Indiana and Vermont the law prescribing the death-penalty must be considered a dead letter, as no executions have taken place there for years. In 1887 the Central-American States Honduras, Costa Rica, Nicaragua, and Guatemala entered into negotiations for forming a Union, similar to the United States, with the express condition, that the death-penalty in those states should be abolished." The Legislature of the State of New York has recently substituted execution by electricity for hanging. Upon this Mr. Gerbard asks: "But is not the death-penalty in itself an inhumanity, a cruelty and a barbarism, belonging to former dark ages? Is not each and every mode of

carrying out the death-penalty, be it by hanging, decapitation, shooting, garroting, electricity, poison or any other way a *willful* killing, a murder? Should not our century, which has abolished the inhumanity and barbarism of slavery, following the example of Rhode Island, Michigan and Wisconsin, abolish also the inhumanity and useless barbarism of the death-penalty in all the other States of the Union, showing to the world by this new step forward, that the United States in every respect are at the head of civilization?" The writer believes that the arguments which he advances are so strong and indisputable that even those who have hitherto thought the death-penalty indispensable will now come to another conclusion. "The Bible says: 'He who sheddeth man's blood, by man shall his blood be shed.' But on the other hand, the Bible also says: 'Thou shalt not kill,' and we find here two passages diametrically opposed to each other, so that the advocates as well as the opponents of the death-penalty can base their arguments on the Bible. The penal code has several theories for the death-penalty—namely, determent, retaliation, revenge, satisfaction for the state, and security for the state. The three latter have been pretty well abandoned, and the justification of the death-penalty is now mainly based on the theory of deterring by intimidation, insisting or supposing that an execution must be a warning to others not to commit a similar crime. But the penal code recognizes still another theory as the warrant for punishment *in general*, and that is the reformatory theory—the only one which is morally justified, but which cannot be considered in the case of a death-penalty; because, if a person be executed, there can be no intention of reforming him, and if we hang a man we deprive him, through violence, of all possibility of reformation; we rest satisfied with simply taking his life, murdering him. According to the first passage: 'He who sheddeth man's blood, by man shall his blood be shed,' in the death-penalty merely a remnant of 'vendetta' is exercised. \* \* \* I repeat, the foremost and only moral end of any punishment is the reformation of the criminal; and for this high purpose capital punishment does not answer, but has even the diametrically opposite effect. \* \* \* That the death-penalty as a means of deterring from crime is a complete mistake; that, on the contrary, the abolition of the death-penalty lessens the number of the worst crimes, whilst executions increase them, is proved by the experience of various countries. In Holland no parricide or matricide was committed in the ten years following the abolition, whilst these crimes occurred frequently in the fifty years preceding the abolition. In Tuscany it was shown that the abolition of the death-penalty led to no increase in the number of the crimes considered worthy of death; and the same result has followed the abolition in some States of the Union. An English prison-chaplain, who during his official career prepared 167 criminals for execution, has testified that of these 167 persons, 161 had been proved to have witnessed executions. There is evidence that people who had just seen an execution, only a few hours afterward, themselves committed murder. Can one, in the face of such testimony claim any validity for the theory of deterring by intimidation? Considering the frightful brutality in the intentional killing of a human being, considering the profoundly demoralizing effect which executions entail, and, from their very nature, must entail, one can indeed not wonder that their result is not a decrease, but an increase of heinous crimes. \* \* \* But executions have still another dark side: it consists in the blasphemy of the priests. They represent to the condemned that they will enter now directly into heaven, and be received by Christ; there stands the culprit, instead of being deeply humiliated by the sense of his criminality, actually jubilant, and rejoicing that he will soon be with Christ, and that Christ will receive him with all glory! Is not that rank blasphemy? The priests who seduce these miserable sinners to such fantastic visions, ought, instead, to exert all their influence to induce them to really repent of their bloody deeds. Such a conversion, at the moment of going to the gallows, is utterly worthless, and nothing but a self-deceit and a deception of others."

## THE LEADING ORGAN

of British Thought on the American Continent.

**"THE WEEK,"**

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.  
 "THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thorough and independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
 5 Jordan Street,  
 Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,

 rec. mailed. Chas. H. Kerr & Co., Pub's, Chicago.

## CONTENTS OF FORMER NUMBERS OF "THE OPEN COURT."

## THE FIELD-INGERSOLL CONTROVERSY.

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Gladstone's Remarks upon the same will be found in Nos. 43 and 44. The questions and issues involved are treated from an independent and impartial standpoint. The inefficiency of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position and significance of both parties in the development of the religious idea are pointed out and each is recognized as important and necessary to the ultimate synthesis of religious truth, a religion which will in the end be what is good in all.

## ETHICS AND PUBLIC LIFE.

W. M. SALTER.....In No. 45.

The well-known lecturer of the Society for Ethical Culture in Chicago bravely probes the wounds of our public life and shows his patriotism by boldly denouncing the evils and wrongs of American politics. But he is no pessimist; he does not despair of improvement and progress. He knows very well that men "of Roman virtue" still exist. Mr. Salter wants to elevate our conception of politics, so that the best men in the community would lose their repugnance to public life; that they would enter it once more to make it great and illustrious.

## YOU SHOULD READ

## AMERICA.

## WHY?

Because it is the only paper in America that advocates American rule in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson,  
 Sen. Teller, Sen. Mitchell, Sen. Dawes,  
 Sen. Stewart, Hon. Theodore Roosevelt,  
 Seth Low, Hon. Andrew D. White,  
 Ella Wheeler Wilcox, Bishop Cox,  
 Hon. James Russell Lowell, Admiral Porter,  
 Charles Dudley Warner, James Whitcomb Riley,  
 Frank R. Stockton, Edgar Fawcett,  
 J. T. Trowbridge, Edgar Saltus, Robert Grant,  
 Julian Hawthorne, W. Clark Russell,  
 and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy, and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

P. O. DRAWER F. CHICAGO, ILL.

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

C. K. WHIPPLE.

"Progressive Orthodoxy," by C. K. Whipple, in No. 25, is a very keen and rather sarcastic censure on "The American Board of Commissioners for Foreign Missions." The said "Board" declined to comply with the request of their missionaries to make a few changes in the plan of saving the savages. These Innocents, it was experienced, object in an absurd benevolence to the plan of eternal damnation, so as to be lost for Christianity. Mr. Whipple, it seems, did not consider that the Board could not have acted otherwise, for it would have been an outright confession that the savages had converted the missionaries, a most illogical and very improper thing to do.

G. H. SCHNEIDER.

In No. 24 will be found an essay of profound and radical thought on "Reflex Motions" by G. H. Schneider. The chaos of the old psychology is cleared since modern psychology begins to discover the laws which govern the intellectual domain of the soul. Schneider shows that the activity of the mind can be resolved into pure reflex actions, and illustrates his view in the following diagrams:

A mechanical cause, say the pressure of a limb, produces a mechanical effect, viz., the motion of the limb.

The physiological aspect is more complicated. The mechanical cause (say the pressure of a limb) causes a mechanical effect (for instance, a compression of flesh). This mechanical effect produces a physiological cause (viz., a change of the chemical constituents in the muscle and nerve tissues). This physiological effect produces a mechanical cause (which may be a cramp of the muscle), and accordingly it causes as a further mechanical effect a prolonged contraction of the limb. The diagram for a physiological reflex motion is thus:

The psychical reflex motion superadds the element of consciousness. A mechanical cause (say somebody receives a blow on his arm) produces a mechanical effect. This mechanical effect causes a physiological effect in the muscle and nerve tissues, which again is the cause of a psychical effect, as pain is felt. This psychical effect causes another psychical effect, which may result in a state of anger and desire for vengeance. This psychical effect again is the cause of a physiological effect. It acts on the motory nerves, which in their turn causes the motory muscles to contract and retaliate the blow. The blow returned is in this case the mechanical effect of the first mechanical cause, i. e. the blow received. The following diagram will explain it more fully:

## TRANSFORMATION AND ADAPTATION IN SCIENTIFIC THOUGHT.\*

AN INAUGURAL ADDRESS DELIVERED UPON ASSUMING THE  
RECTORATE OF THE UNIVERSITY OF PRAGUE,  
ON OCTOBER 13, 1885.

BY ERNST MACH.

Part II.

*Translated from the German by J. H. M.*

Let us consider a mental transformative process more in detail. The circumstance that heavy bodies fall to the earth appears perfectly regular and natural. But when a person observes that wood floats upon water, and that flames and smoke rise in the air, then the contrary of the first phenomenon presents itself. An olden theory attempts to explain these facts by imputing to substances the power of volition, as being that attribute which is at the freest disposal of man. It asserted that every substance seeks its proper place, heavy bodies tending downwards and light ones upwards. It soon turned out, however, that even smoke had weight, that it too sought its place below, and that it was forced upwards only because of the downward tendency of the air, as wood is forced to the surface of water, because the water exerts the greater downward pressure.

Again, we see a body thrown into the air. It ascends. How is it that it does not seek its proper place? Why does the velocity of its "compulsory" motion decrease as it rises, while that of its "natural" fall increases as it descends. If we closely mark the relation between these two facts, the problem will solve itself. We will see, as Galileo did, that the decrease of velocity in rising and the increase of velocity in falling are one and the same phenomenon, viz, an increase of velocity in the direction of the earth. Accordingly, it is not a place that is assigned the body; it is an increase of velocity towards the earth, which is impressed upon it.

Through the agency of this idea the movements of heavy bodies become perfectly familiar. And Newton, firmly grasping this new way of thinking, sees the moon and the planets moving in their paths upon principles similar to those which determined the movements of the projectile thrown into the air. Yet the movements of the planets were marked by certain peculiarities which compelled him once more to modify partly his customary mode of thought. The heavenly bodies, or rather the parts composing them, do not

persist in a fixed rate of speed while acting upon one another; they "attract each other," directly as the mass and inversely as the square of the distance.

This latter notion which includes the one applying to terrestrial bodies as a special case, is, accordingly, quite different from the conception we started with. How limited in scope was the original idea and to what a multitude of phenomena is not the present notion applicable! Yet there is a trace of the "search for place" in the very expression "attraction." And it would be folly, indeed, for us to avoid, with punctilious dread, this conception of "at-traction" as bearing traces of its pedigree. It is the historical base of the Newtonian conception and it still continues to direct our thoughts in the paths so long familiar to us. Thus, the happiest ideas do not fall from heaven; they spring rather from notions already existing.

Similarly, a ray of light was first regarded as a continuous and unvarying straight line. It then became the path of projection for minute missiles; then an aggregation of the paths of countless different kinds of missiles. It became periodic; it acquired various phases; and ultimately it even lost its motion in a straight line.

The electric current was conceived originally as the circuit movement of an hypothetical fluid. To this conception was soon added the notion of a current produced by chemical causes; and the notion of an electromagnetic and anisotropic-optical field of force, intimately connected with the path of the current. And the richer a conception becomes in following and keeping pace with facts, the more adapted this conception is to anticipate them at the proper time.

Adaptive processes of this kind have no assignable beginning, inasmuch as every problem that incites to new adaptation, presupposes a fixed and habitual method of thought. Moreover, they have no visible termination; in so far as experience never ceases. Science, accordingly, stands midway in the evolutionary process; and science may advantageously direct and promote this process, but it can never take its place. That science is inconceivable the principles of which would enable a person without experience to construct the world of knowledge, without having known it. One might just as well expect to become a great musician, solely by the aid of theory, and with-

\* Translation copyrighted.

out musical experience; or to become a painter by following the directions of a text-book.

In glancing over the history of an idea with which we have become perfectly familiar, we are no longer able to appreciate the full significance of its growth. The deep and vital changes that have been effected in the course of its evolution, are recognizable only from the astounding narrowness of view with which great contemporary scientists have occasionally opposed each other. Huyghens's wave-theory of light was incomprehensible to a Newton, and Newton's idea of universal gravity was unintelligible to a Huyghens. While a century afterwards it came about that both notions were reconcilable even to ordinary minds.

On the other hand, the original creations of pioneer intellects, unconsciously formed, do not assume a foreign vesture; their form is their own. In them, childlike simplicity is joined with the maturity of manhood, and they are not to be compared to processes of thought in the average mind. The latter are carried on as are the acts of persons in states of mesmerism, where actions involuntarily follow the images which the words of other persons suggest to their minds.

The ideas that have become most familiar through long experience, are the very ones to intrude themselves into the conception of every new fact observed. In every instance they thus become involved in a struggle for self-preservation, and it is just they that are seized by the inevitable process of transformation.

Upon these facts rests substantially the method of explaining by hypothesis new and uncomprehended phenomena. Thus, instead of forming entirely new notions to explain the movements of the heavenly bodies and the phenomena of tides, we imagine the material particles composing the bodies of the universe to possess weight or gravity in their relations to each other. Similarly, we imagine electrified bodies to be charged with fluids that attract and repel, or we conceive the space between them to be in a state of elastic tension. In so doing, we substitute for new ideas the distinct and more familiar notions of former experience— notions which to a great extent run unimpeded in their courses, although they too must suffer partial transformation.

The animal cannot construct new members to perform every new function that circumstances and fate demand of it. On the contrary it is obliged to make use of those it already possesses. When a vertebrate animal chances into surroundings where it must learn to fly or swim, an additional pair of extremities does not grow for this purpose. On the contrary the animal must adapt and transform a pair that it already has.

The construction of hypotheses, therefore, is not the product of artificial scientific methods. This pro-

cess is unconsciously carried on in the very infancy of science. Even later, Hypotheses do not become detrimental and dangerous to progress except when more reliance is placed in them than in the facts themselves; when the contents of the former are more highly valued than the worth of the latter, and when, rigidly adhering to hypothetical notions, we overestimate the ideas we possess as compared with those we have to acquire.

The extension of our sphere of experience always forces a transformation of our ideas. It matters not whether the face of nature becomes actually altered, presenting new and strange phenomena, or whether these phenomena come to light through an intentional or accidental turn of observation. In fact, all the many different methods of scientific inquiry, and of intended mental adaptation enumerated by John Stuart Mill, those of observation as well as those of experiment, are ultimately recognizable as forms of one fundamental method, the method by change. It is through change of circumstances that the natural philosopher learns. This process, however, is by no means confined to the investigator of nature. The historian, the philosopher, the jurist, the mathematician, the artist, the æsthetician, all illuminate and unfold their ideas by delving into the rich treasures of memory and producing similar, yet different, cases; thus, they observe and experiment in their thoughts. Even if all sensory experience should suddenly cease, the events of former times would alternately encounter each other in our consciousness and the process of adaptation would still continue—a process which, in contradistinction to the adaptation of thoughts to facts in practical spheres, would be strictly theoretical, as it is an adaptation of thoughts to thoughts.

The method by change introduces to us analogous cases of phenomena, which have elements partly the same and elements partly different. It is only through comparing different cases of refracted light at changing angles of incidence that the common factor, or the constant ratio which exists between the angles of incidence and refraction, is disclosed. And only by comparing the different degrees of refraction which light of different colors suffers, does the difference of refrangibility, or the inequality of the indices of refraction, arrest attention. Comparison based upon change leads the mind simultaneously to the subtlest abstractions and to the finest distinctions.

Without doubt, the animal is also able to distinguish the similar and dissimilar of two cases. Its consciousness is aroused by a noise or a rustling, and its centre of motility is placed in readiness. The sight of the creature causing the disturbance will, according to its size, provoke either flight or prompt pursuit; and in the latter case, the more exact distinctions will

determine the mode of attack. But it is only man that attains to the faculty of voluntary and conscious comparison. Man alone can in one moment by his power of abstraction rise to the comprehension of principles like the indestructibility of matter and the conservation of energy, and in the next observe and mark the arrangement of the iron lines in the spectrum. In thus proceeding with the subjects of his conceptual life, his ideas unfold and expand, like his nervous system, to a widely ramified and organically articulated tree; he may follow every limb to its farthest branches and, as occasion demands, return from the point attained to the trunk from which he started.

The English philosopher Whewell has asserted that for the development of natural science, two factors must co-operate: ideas and observations. Ideas alone dissipate into speculation; simple observations afford no organic knowledge. We see in fact that the whole thing depends upon the capability of adapting existing notions to fresh observations.

Over-readiness to yield in the face of every new fact prevents all fixed habits of thought from arising. Excessively rigid habits of thought impede freedom of observation. It is in the struggle and in the compromise between judgment and prejudgment (prejudice) that our understanding of things widens.

An habitual judgment, applied to a new case without having been antecedently tested, we call a pre-judgment (prejudice.) Who does not know its fearful power! Less often, indeed, do we think of how important and necessary the prejudgment can be. Nobody could exist in a physical sense if he had to guide and regulate the circulation, respiration and digestion of his body by conscious and premeditated acts. So, too, no one could exist in an intellectual sense if he were constrained to pass judgment upon all that he experiences instead of allowing himself to be controlled by the judgments he had already formed. The pre-judgment (prejudice) is a sort of reflex-motion in the province of intelligence.

Upon pre-judgments, *i. e.*, upon habitual judgments which are not tested in respect of applicability in every instance, rests a goodly part of the intellectual work and of the practical manipulations of the natural scientist. Upon pre-judgments rest the majority of the acts of society. With the sudden disappearance of pre-judgments society itself would helplessly dissolve. That prince displayed a deep insight into the power of intellectual habit, who quelled the loud menaces and demands of his body-guard for arrears of pay and compelled them to turn about and march, by simply pronouncing the usual word of command; he well knew that they would be unable to resist that.

It is not until the departure between habitual judgments and facts becomes great that the investigator

falls into appreciable deception. Then do tragic complications and catastrophes enter into the practical life of individuals and nations—crises where man, placing custom above life instead of pressing it into the service of life, becomes the victim of error. The very power which in intellectual life, advances, fosters and sustains us, may under other circumstances delude and annihilate us.

\* \* \*

Ideas are not the whole of life. They are but like a momentary efflorescence of light, designed to illuminate the paths of the mind. Our ideas act as the most delicate of reactions upon our organic evolution. No theory can dispute the vital transformation which we feel taking place within us through their agency. Nor is it necessary that we should have a prior proof of this process. We are immediately assured of it.

The transformation of ideas thus appears as a part of the common evolution of life, as a part of the process of adaptation to an ever growing sphere of activity. A granite boulder on a mountain side tends steadily towards the surface of the earth below. But it must abide in its bed for thousands of years before its resting-place gives way. The shrub that grows at its base is farther advanced; it accommodates itself according to summer and winter. The fox which, overcoming the force of gravity, creeps to the summit where he has scented his prey, is more unconstrained in his movements than either. Yet the arm of man extends still further; scarcely anything of moment that happens in either Africa or Asia, passes us by without leaving an impression upon our lives. What an immense portion of the life of other men is reflected in ourselves; their joys, their affections, their happiness and misery! And this too, when we survey only our immediate surrounding, and confine our attention to modern literature. How much more do we experience when we travel through ancient Egypt with Herodotus, when we stroll through the streets of Pompeii, when we carry ourselves back to the gloomy period of the crusades or to the golden age of Italian art, now making the acquaintance of a physician of Molière, and now of a Diderot or a D'Alembert. What a great part of the life of others, of their character and their purpose, do we not absorb through poetry and music! And although they only gently touch the chords of our emotions, like the memory of youth softly breathing upon the spirit of an aged man, we have nevertheless lived them over again in part. How great and comprehensive does self become in this conception; and how insignificant, the person! Egoistical systems of optimism and pessimism perish with their narrow standard of the significance of intellectual life. We feel that the real pearls of life lie in the changing content of consciousness, and that the person is but like

an indifferent and symbolical thread on which they are strung.\*

We are prepared then to regard ourselves and every one of our ideas as the product and the subject of general evolution; and in this way we shall advance sturdily and unimpeded along the paths which the future will throw open to us.†

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.‡

BY FELIX L. OSWALD, M. D.

Part XII.

#### HEREDITY—Continued

The intellectual types of nations, as of individuals, are more plastic than their moral characteristics. Experienced educators well know that mental precocity is by no means an invariable indication of genius, and that the dunces of the spelling-class may graduate with the highest honors, while early evidence of moral turpitude is a much more serious omen.

"The fruits of genius ripen late," says Schopenhauer, "and there is nothing humiliating in the confession of intellectual backwardness, but few people would care to admit the moral obliquity of their earlier years. We would justly doubt the correctness of a statement that so and so was notoriously a mean and malicious boy, but has now become a moral exemplar."

It is impossible to mistake the significance of the fact that the influence of heredity, too, is much more frequently illustrated in moral than in mental peculiarities. Peasant-boys may become the intellectual aristocrats of their nation, but convict-colonies are not prolific of saints. Some biologists have, indeed, gone so far as to deny the possibility of eradicating hereditary vices by means of education, and to advocate the enforced celibacy of criminals. Miss Martineau held the re-appearance of paternal disposition to special crimes a mere question of time, and unhesitatingly ascribed the apparent exceptions from that rule to the influence of fear or hypocrisy. "In the far-reaching influences that go to every life," says the Rev. Robert Collyer in his sermon on "The Thorn in the Flesh,"

\* We must not allow ourselves to fall into the deception of believing that the happiness of other people is not a very considerable and essential portion of our own. It is common capital, which cannot be created by the individual and which does not perish with him. The formal and material limitation of the *Ego* is necessary and sufficient for only the crudest practical objects, and will not stand in this conception. Humanity in its entirety is like a polyp-plant. The material and organic bonds of individual union have, indeed, been severed; they would only have impeded freedom of movement and evolution. But the ultimate aim, the psychical connection of the whole, has been attained in a much higher degree through the more luxuriant development which has been thus made possible.

† C. E. von Baer, the scientist who first formulated the idea of evolution, and the subsequent opponent of Darwin and Haeckel, has aptly discussed this point in two addresses, entitled: "Das Allgemeine Gesetz der Natur in aller Entwicklung," and "Welche Auffassung der lebenden Natur ist die richtige, und wie ist diese Auffassung auf die Entomologie anzuwenden?" In these remarkable essays he has exposed the narrowness of the view which regards an animal in its existing state as finished and complete, instead of conceiving it as a phase in the series of evolutionary forms and regarding the species itself as a phase of the development of the animal world in general.

‡ Translation copyrighted

"children are often born with appetites almost fatally strong in their nature. As they grow up, the appetite grows with them; and speedily becomes a master, the master a tyrant; and by the time he arrives at manhood, the man is a slave. I heard a friend say that for the last eight-and-twenty years the soul within him had to stand like an unsleeping sentinel, guarding his appetite for strong drink. To be a man at last under such disadvantages, not to mention a saint, is as fine a piece of grace as can well be seen. There is no doctrine that demands a larger vision than this of the depravity of human nature. Old Dr. Mason used to say that, as much grace as would make John a saint would hardly keep Peter from knocking a man down."

It would be preposterous to deny that time and altered circumstances can modify and, in the course of generations, perhaps eliminate, a hereditary predisposition to crime, just as similar influences have undoubtedly eliminated what pathologists call an "hereditary diathesis" to certain chronic diseases. In the climate of our western prairies the progeny of consumptive ancestors have enjoyed a lifelong immunity from pulmonary disorders, and in the course of six or seven generations the children of Botany Bay felons may become law-abiding citizens, if not paragons of civic virtue. But it remains true that under all possible varieties of educational influences, the moral (far more than the mental) characteristics of individuals resemble those of their immediate ancestors.

Transcendent talents are but rarely transmitted from father to son, so rarely, indeed, as to have tempted many biologists to infer the "genealogical barrenness of genius"; but history abounds with instances of the hereditary transmission of peculiar passions, vices and virtues. A British biographer's assertion that "no son was more unlike his father than the great Frederic was to his uncouth sire," is true only in regard to intellectual characteristics. Between the philosophical tastes of the Sansouci freethinker and the narrow bigotry of his predecessor there is indeed, an almost unparalleled contrast, but in many other respects Frederic the Second was unmistakably "the son of his father." He shared his obstinacy of purpose, his self-dependence, his mistrust of neighbors and relatives, his "passion for meddling," for financial retrenchments and even for arbitrary innovations and executive deeds of violence. Wolfgang Goethe, with all his cosmopolitan tendencies and encyclopedic erudition, was not quite free from the practical pedantries of his prosaic father. The headstrong passions of Henry de Guise can be traced through a long lineage of his ancestors. Mirabeau, the great freethinker and orator, the "Alcibiades of the French Revolution," was the son of an intellectual philistine, but the moral dynamics that blazed aloft in the great

eruption of a political volcano, had for ages fired the domestic and municipal passions of the Riquettis, "a race of grandiose characters," as St. Beuve informs us, "*une race des caractères d'une originalité grandiose et haute.*"

Oliver Cromwell was the descendant of a family whose factious propensities had been for generations suppressed by a combination of political and clerical despotism, but which, nevertheless, produced two men as eminent as Hampden, the fearless patriot, and Edmund Waller, the poet and passionate orator. The heartless and brainless monster-tyrant Nero, was a scion of the Claudian race, a family prolific of headstrong men of rather varying intellectual abilities, but all remarkable for the violence of their passions, their unscrupulous ambition and their reckless vindictiveness. Lord Byron's father was not a man of poetical, or even of literary tastes, but his eccentricities fully equaled those of his wayward son, whom he resembled even in his penchant for traveling and the emotional demonstrativeness of his friendships and enmities. The poet's mother, "the Newstead virago," deserved her sobriquet by her virulent passions, rather than by the vigor of her intellect. She dawdled away her leisure in gossip and the gratification of whims that often made her neighbors doubt her mental sanity; but she had a full share of her son's sensitive pride. "She had no more self-control than a child," says Mrs. Caroline Ellis, "and if ever there was a case in which hereditary influences, arising out of impulse, passions and habits of life, could excuse eccentricities of character and extremes of conduct, this excuse must be pleaded for Byron, as having descended from a line of ancestry, distinguished on both sides by everything calculated to destroy all harmony of character, all social concord, all individual happiness."

The poet's grandfather had served with distinction both in the army and navy, and rose to the rank of admiral, but he, too, was a man of headstrong passions, and his penchant for braving the perils of the sea in any sort of wind and weather had earned him the sailor-nickname "Foul Weather Jack."

A phenomenal case of mental, moral and emotional analogies in father and son, is that of the two Scaligers, both men of great natural abilities and of almost unparalleled erudition. Yet it is doubtful if the literary fame of the elder Scaliger would have outlived his century without the prestige of his greater son. He had neither the refined taste nor the infallible critical acumen of his immortal pupil, but the identity of their moral propensities and caprices in all curiosities of detail, could hardly have been more absolute. Both were excessively vain, both morbidly sensitive and impatient of contradiction, both were incurably addicted to "controversion for its own sake," picking

literary quarrels for the mere purpose of indulging their passion for criticism, and, of course, making no end of open and secret enemies. Both contrived to reconcile the profession of liberal principles with supercilious manners and an overbearing treatment of domestic and official subordinates, yet withal, both were capable of passionate attachments, and were pedantically scrupulous in the fulfillment of every official obligation. They both were chivalrously constant in their friendship but treated the fairer sex with rather more than cynical ungalantry. Julius (the elder) Scaliger increased the list of his enemies by satirizing the foibles of his female contemporaries and married late; his son Joseph refused to answer the letters (even scientific inquiries) of his lady correspondents, and never married at all.

The records of biography furnish only three authentic instances of the hereditary transmission of abnormally developed mental faculties: 1. Sebastian Bach, the great composer, and his son Charles Emanuel Bach, the founder of modern piano-forte music, and like his father an originator of inimitable harmonies; 2. The elder and younger Pitt, both orators of transcendent ability; 3. The two Senecas, Lucius Seneca, the philosopher, whose abnormal memory enabled him to achieve success in the simultaneous pursuit of literature, politics and commerce. He was at once the greatest scholar and the most sagacious statesman of his age, and amassed a fortune of untold millions, but his distinctive faculty was equalled only by that of his father, the Spaniard Marcus Seneca, whose memory enabled him to repeat *two thousand words* in the order he heard them, and irrespective of their meaning or connection.

Equally peculiar moral characteristics, on the other hand, have often been transmitted through a long series of generations. There have been genealogies of misers and long lineages of pickpockets and misanthropes, spendthrifts and bigots, and even of pessimists, whose life-weariness at the approach of a certain age, culminated in a monomania for self-destruction, or even in actual suicide. Our Spanish-American neighbors do not deal in elaborate statistics, yet the mere sensational atrocity of successive crimes enabled a Mexican jurist to trace the genealogical record of the bandit Vittorino Cardenas, who in 1869 was executed for the butchery of a party of unsuspecting tourists, to whom he had volunteered his services as a mountain-guide. It was shown that a remote ancestor of this man had fled from Spain to avoid indictment for a heinous crime, which he afterwards expiated by the bravado of his military exploits. He was not only pardoned, but acquired political influence enough to secure a commutation of sentence in favor of his son, who had plundered and murdered several native pris-

oners, and who subsequently became the leader of a band of outlaws, a dignity which after his death on the gallows was transferred to his grandson, whose father (the son of the gibbeted brigand) had been killed in a fight with the escort of a *conduta* or silver-train. Vittorino was the grandson of that bandit-chief, and his father, a strolling miner, was the only representative of six successive generations who was not positively known to have taken the field against the party of law and order.

Dr. Esquirol describes the "suicide-mania" as a special form of hereditary insanity, and estimates that four out of ten self-murderers act under the impulse of a moral predisposition, rather than of physical disorders, or the haunting memory of a severe bereavement. Drunkenness and the proneness to sexual excess have characterized special families for centuries and at last led to the extinction of their lineage. A passion for gambling is said to be hereditary in a certain illustrious family of Hungarian nobles, and more than one great house of mediæval aristocrats owed its downfall to an incurable penchant for financial extravagance. Dr. Esquirol mentions a case of a father, son and grandson, falling victims to a preposterous propensity (a true mania, in fact) for duels; but a still stranger instance is that quoted by Prof. Proctor from the memoirs of Dr. Lucas, who informs us that "a man in Scotland had an irresistible penchant for cannibalism, and his daughter, although removed from her parents, who were both sent to the stake before she was a year old, and although brought up among respectable people, this girl, like her father, yielded to the horrible craving for human flesh." A fondness for procrastination (laziness, in plainer English) is so notoriously hereditary that experienced work-masters generally refuse to employ the son of an indolent man. "Nemo repente fuit turpissimus" is a proverb that applies to families, as well as to individuals; and occasional exceptions justify the suspicion by which Erotius explains the phenomenal depravity of the tyrant Domitian: "Vespasian may have *mistaken* him for his son."

#### TRAGEDY AND THE PROBLEM OF LIFE.

Art is no mere trifling and playing, attractive and charming though its works may be. Its object is grand and serious, and its aim is not inferior to that of science.

Art and science both reveal the secrets of nature, but they adopt different methods. While science inquires into the various provinces of nature under the guidance of induction and deduction, art, intuitively grasping the idea of the whole and representing nature in single examples, gives a clew to the enigma of the world.

Every object of art is a microcosm—a little world in itself, which means, it forms an orderly arranged unity. Unity is the first and principal rule of art, which by all variety should never be neglected in any artistic production. The rule of unity teaches us that there is law and order in the microcosm of an artistic representation and at the same time suggests that the same order can be found in the macrocosm. In the creations of his imagination the artist explains the problem of the world. In his works every part must be understood through the whole, and the whole is revealed in its parts. Thus in the world and in life every single thing or being, its form, its aspect, its purport, must be interpreted as a part of the whole or as one phase in the development of all-existence. With regard to this, the Romans called a poet *vates*, seer or prophet. The poet is a priest of humanity. And, truly, of every real artist and poet one must aver, as Goethe makes Wilhelm Meister say about Shakespeare, "It is as though he revealed all the secrets of life, and yet one cannot say that this or that passage contains the solution of the riddle."

Poetry is generally considered as the highest art, if a gradation of the arts is allowable at all. Music and Dancing, Painting and Sculpture and other arts exhibit a harmonious order in the rhythm of sounds or movements and in the harmony of colors or figures; they are most powerful and effective, but they do not rise to the clear conceptions of poetry, which expresses human sentiments in words and thoughts. The drama is again considered as the highest kind of poetry and among dramas the tragedy takes precedence as the profoundest, the most dignified and most philosophic representation of human life.

Not every tragical drama is a tragedy. German æstheticians make a distinction between a *Trauerspiel* and a *Tragödie*. The tragical drama is any representation on the stage which produces mournful and inauspicious dramatic actions, while the essential feature of a tragedy must be found in the psychical development of the acting persons. The complication of the plot brings about an entire change of situation (what Aristotle calls the *peripeteia*), leading to the catastrophe. By the crisis, however, a psychical change takes place also. The acting persons, especially the hero of the drama, take another and a higher view of life and of their ideals. While the hero suffers and even dies, his ideals grow and expand. A tragical drama may represent the disastrous consequences of vice or folly only; a tragedy reveals the law of evolution which leads through toil and sacrifice to the victory of a lofty idea.

From the time of Aristotle the tragedy has been considered as the highest kind of art, perhaps because the tragic poet digs down to the deepest problem of

human life: Why must the innocent suffer and why are the heroes of humanity martyrs of human ideals?

One of the greatest problems of æsthetics has been the question: How can we derive pleasure—and the noblest kind of pleasure, too—from observing, on the stage, representations of tragic events? We condemn cock fights and gladiator shows; but it is a noble pastime to witness the sufferings of a hero in a theatre. Is it not because the hero suffers for a Cause, and the spectators learn from him how to live, to suffer and to struggle?

There is a law of life and of the evolution of life; and we cannot understand one phase of life without taking into consideration the law which pervades the whole. The three chief stages of psychical growth are designated by the three views of life: 1, *optimism*; 2, *pessimism*; and 3, *meliorism*.

The human being in his youth is optimistic; but when a man encounters worldly evils, when care preys upon him, sorrows worry him, and want and illness harass him, when the solemnity of death impresses his soul with fear of the unknown future, then a crisis arises in the psychical development: the catastrophe of pessimism destroys the optimistic delusions of early years, and it is but with heartrending struggles that man regains the lost balance of his aspirations in establishing a purified, a higher view of life which we call *meliorism*.

In the phase of *optimism*, man enjoys life and accepts it as a boon which has value in itself. We live simply for the pursuit of happiness. Optimism is the ingenuous conception of the child and of childlike natures. In the phase of *pessimism*, man despairs of ever being successful in his pursuit of happiness. Man learns that if happiness is the sole purpose and aim of life, life is a failure and life is not worth living. But pessimism is not the end of all worldly wisdom. *Meliorism* is taught by the martyrs of truth who suffer at the stake and the heroes of progress who die on the field of battle; they have lived a life that was well worth living. It is not life but the contents of life, our actions done, our deeds performed, and our ideas thought, that have value. Life is valuable because it is an occasion to work and to struggle, to advance and to progress. The phase of *meliorism* recognizes that the purpose of life lies beyond the narrow sphere of the ego; the value of life lies in our ideals, which will live after us, which, indeed, are worth living and toiling and striving for.

The highest art represents man as struggling for and aspiring to noble ideals, it exhibits the development from a naïve, childlike existence through the crucial test of evil, error and failure, through misery and terror of death to the conscious and manly standpoint of *meliorism*. Such a representation is the tragedy. It

is not essential that the hero should die, but it is necessary that he should pass through a process of trial and purification. Thus the hero has become another man. In spirit he is new-born, and takes a new and deeper view of life and its import. The crisis of pessimism has matured his mind, and even should he die, his ideal lives; vanquished, his ideal is victorious!

In this manner the doctrine of *meliorism* sheds a new light on Tragedy and explains most clearly the complete sense of the Greek term, *katharsis*, or purification of the hero, which Aristotle teaches us to be the purpose of a tragedy. This *katharsis* should be infused into the souls of the audience through the medium of *pity and fear* (*δι' ἔλεος καὶ φόβον*): pity for the hero and fear in the auditor for himself lest he may meet with the same fate. The audience should be led through the same ordeal of purification. Without positive suffering, but merely by witnessing the suffering of the hero, they attain a higher, a purer, and a more ideal conception of life. It is the destruction of the egotistic passions (*καθάρσις τῶν παθημάτων*) and the construction of a lofty philanthropic temple of altruism. The hero no longer lives for himself; he lives for his ideals. His ideals live in him and his life is subservient to his ideals. In listening to a tragedy we are overawed; our souls are full of sentiment which is best expressed in the ecclesiastical term of *edification*.

According to Schopenhauer and his pessimistic adherents, the purpose of a tragedy is to preach pessimism; the hero has to turn his back upon life. In the school of misery he must learn to resign and deny his will. Schopenhauer, Hartmann and Mainländer declare that negation of will is the only aim worthy of religion and philosophy. It is this negation, they declare, that tragedy has to exhibit. But Schopenhauer did not find one instance among the ancient tragedies in which the hero really denies his will. Ajax commits suicide in order to atone for his errors, yet there is nothing of negation of will. Neither is it to be found in *Œdipus*. Hippolytus when dying is consoled by Artemis, who promises, after his death, to bestow upon him the highest honors in Thebes. From these instances Schopenhauer does not conclude that his theory is wrong, as probably Lessing would have done, to whom the ancients were the standard of good taste; he argues that classical tragedy is shallow and inferior to the Christian dramas, which rank higher owing to the fact of their heroes expiring with enthusiasm. Lessing mentions, in his *Dramaturgie*, Christian dramas in which the heroes sometimes rush into death with the confidence of finding a higher and a happier existence in another world. We should not, however, call this a pessimistic negation of life. They love life, but they prefer eternity. It is the

aspiration toward some higher state of existence which allures them to their fate.

Among our standard works of pessimistic art there is not any pessimistic tragedy, except the operas of Wagner, and particularly *Die Götterdämmerung*, in which Wotan terminates the existence of the world, and, tired of life, commits suicide. Wagner, strongly biased by Schopenhauer's philosophy, intentionally created his works in a pessimistic spirit; he is an exception. Dramas by other poets are free from pessimism, as, for instance, *Faust*, *Egmont*, *Marie Stuart*, *Romeo and Juliet*; the minds of the chief characters exalted by their sufferings even to death, are elevated to a higher range. They do not attain a negation of will or annihilation of the ideal to which they aspire. Just the contrary, while Romeo and Juliet die, their love lives and restores peace between the hostile houses of their parents. In a word, our standard tragedies are melioristic and not pessimistic; for, otherwise, in their development, we should miss the solace which alone is able to afford us consolation for the misfortunes of our heroes.

The auditors profit by the experience of the hero. They grow spiritually, intellectually and morally, while he grows through his struggles. While he gains in breadth of mental grasp and in intensity of feeling, the spectators also gain. The purification of our souls, the intellectual and moral gain, in one word, the growth of our minds, is what exerts a beneficial influence and constitutes the pleasure of listening to a tragedy; for all growth is a pleasure: it is the only solid pleasure in life.

Schiller finds "the cause of the pleasures we derive from tragic objects" in "our admiration of moral propriety, which is never more vividly recognized than it is when found in conflict with personal interest and still keeps the upper hand." Schiller says: "We here (in some tragedy) see the triumph of the moral law so sublime an experience for us that we might even hail the calamity which elicits it;" and, further on: "How noble to violate natural interests and prudence in order to be in harmony with the higher moral law. If, then, the sacrifice of life be the way to do this, life must go." Schiller's explanation is profound and grand, but it does not exhaust the subject. The tragedy is more than a conflict between moral propriety and prudence. Such a conflict might happen in a tragedy but need not happen. The tragedy is rather the solution of the problem of life. The question, What do we live for? is answered in a tragedy. We do not live for the pursuit of our happiness only, but for the struggle after and the realization of our ideals.

Thus the law of life and of evolution is disclosed. In growing we must ultimately encounter the catastrophe and endure the hour of trial. It cannot be

evaded by any one who is arriving at maturity. Our mental development starts from optimism, and, passing through the inevitable crisis of pessimism, it reaches the manliness of meliorism, which extends our life beyond the narrow limits of our *ego*.

The problem as to what is the purpose of our existence is solved as soon as we recognize that man is one with humanity and that the evolution of the whole universe is at work in his aspirations. The barrier between the *ego* and the All is broken and man's true self is found in his ideals. We can find no satisfaction in the attainment of our personal welfare merely. We must live and struggle and strive onward, not because we chose to do so, but because Nature thus works out her plans in our souls. We must, because evolution is a cosmical law. We are a part of the All, a part in which the All works and shapes its ends. The All works in us as it works everywhere. Man is the highest stage of evolution on earth, and he, therefore, is the most representative part of the All we know of. Man is the first born son of Nature, and humanity with its holiest ideals is on earth the grandest, the most perfect and most beautiful revelation of the All.

Man's life is a constant struggle for progress, a strife for the ideal and an advance to loftier heights on the infinite path of great possibilities. This idea is the keynote which vibrates through the highest works of art and which thrills through the universe as the law of cosmical evolution.

### GOETHE'S THRILL OF AWE.

To the Editor of THE OPEN COURT:—

In reference to the discussion in your issue of June 28th, of Goethe's "Thrill of Awe," it seems plain that the poet refers to that shiver of reverent delight which is experienced when anything new of heroism or sublimity is realized. Lately in conversing on the subject with a number of persons only one of those present but immediately recognized the sensation and could recall instances of experiencing it. One said: "I well remember sitting spell-bound with the shivers running over me when I first heard 'Horatius at the Bridge' read aloud."

This is a sensation perhaps most common to youth and one from which "oft the world may fend us," but whoever has experienced this *Schaudern* has felt that it was the noblest part of his being leaping up to appreciate and reverence exalted deeds and character. It seems to be entirely independent of intellectual discernment or of any action of the will and is rather a spiritual kinship with something external to the person feeling it.

Is not this what Goethe meant? Surely this possibility of being thrilled by the vast, the unknown, the noble, the heroic, is "*der Menschheit bestes Theil*."

CLARA B. COLLY.

BEATRICE, Nebraska.

### THE ANÆSTHETIC REVELATION.

To the Editor of THE OPEN COURT:—

I infer from Mr. M. C. O'Byrne's letter in No. 45, that he has not himself made the experiment with sulphuric ether, and is not

familiar with the recent literature on the subject, to which my previous article gave some references. If this is so, he is discussing the anæsthetic revelation at some disadvantage. The experiment with the anæsthetic is easy and safe for any healthy person, using an ounce or two of the ether, which should preferably be of the purer kind known to physicians as Squibb's ether. It is desirable to omit one meal before taking the anæsthetic.

Is not the attempt to limit the course of psychological investigation by *a priori* considerations, such as those advanced by Mr. O'Byrne, in his letter, a little dangerous? With the awful fate of philosophy in its eyes, psychology may do well to avoid prepossessions, at least it may refuse to accept any dicta from philosophy save such as all philosophers are agreed upon. This stringent though reasonable limitation will throw out absolute idealism.

For the rest, the psychological objection to idealism is evident enough. Idealism and its modern child, phenomenism, assert that all conceivable existence must be of the nature of consciousness, and the arguments adduced appear conclusive. But what is the "nature of consciousness?" That is just what psychology has under investigation. Something is known, much remains to be known about it. The mistake of idealism lies in treating such terms as consciousness, mind, cognition, as *completed concepts* instead of *incomplete concepts*, which they really are. We can only define consciousness as whatever has happened and whatever will happen to mental apprehension. New data come daily. The Society for Psychical Research may any moment come upon phenomena that shall compel psychologists to revise all their preconceived notions.

XENOS CLARK.

#### THE ETHICAL BASIS OF CHARITY.

To the Editor of THE OPEN COURT:—

My Dear Sir: Will you allow me space to reply to one point in Dr. Lindorme's criticism of my article, The Ethical Basis of Charity. It seems to me that Dr. Lindorme's assumption that I confuse "fittest" and "best" is entirely gratuitous. To me the greatest truth of Biology is the absolute indifference of nature to considerations of which we call "best." The greatest danger menacing our civilization arises from the possibility of an inferior race surviving because it can adapt itself to a lower standard of life. Dr. Lindorme in quoting me omits an "if," in which as Touchstone says there is great virtue. I confess it is unscientific to talk about hindering the operation of a law of nature, and to that extent I erred in speaking of the hindrance of the Law of the Survival of the Fittest caused by sentimental almsgiving. But my essay was popular rather than scientific and I used common phraseology. The larger view of course is that sympathy and helpfulness are as much products of nature as is competition, and that charity, however misguided, is part of that Altruism which is an increasingly important factor in Social Evolution. Reasoning by analogy is dangerous and any comparison of a pauper to an animal parasite, which is by no means original but has become common property, is far from perfect. The host of a parasite is an unwilling host and frequently tries to rid itself of its guest. When we feed the pauper on the contrary, we do it voluntarily; the satisfaction of our sympathies being the determining cause. The pauper survives not by Natural Selection, which as I claim would shortly eliminate him, but by Artificial Selection very much like what we use in producing fat cattle or Jacqueminot roses. I did not need to answer the criticism on general principles as I see by your remarks that I am quite safe in the hands of my editor but I do not feel comfortable in resting under an imputation of such "teleological optimism" as Dr. Lindorme accuses me of. I think Dr. Lindorme and I agree very nearly and regret that I did not make my absolute rejection of teleology apparent to so sympathetic and intelligent a critic.

Respectfully,

W. ALEXANDER JOHNSON.

116 La Salle Street, July 20, 1888.

#### CONCORD SCHOOL OF PHILOSOPHY.

MEMORIAL OF A. B. ALCOTT.

BY EDNAH D. CHENEY.

Much regret is felt that the Concord School of Philosophy will not hold its regular session this year, but it is not unfitting that it should pause after nine years work, on the death of its founder, and consider how far it has been possible to carry out his original plan, what has been accomplished during the time it has existed, and what modifications may be desirable in re-opening it at a future time. We shall not attempt to answer these questions fully now, but only say that it has quite justified itself in the interest it has excited in the community, in the stimulus it has given to thought, and in the new combinations of persons separated by early training and influences which it has brought about. It rightly closed this period of its formation by devoting one long lovely summer day to a memorial meeting in honor of its founder, Mr. A. Bronson Alcott. The turf was yet too green above his grave and those who took part in the meeting had too much personal attachment to their friend for a thorough critical analysis of his life and philosophy, yet the whole proceedings were marked by a candid presentation of him in his strong personality without fulsome eulogy or morbid sentimentality. There was no personal gloom, but the fair sweet sunshine of loving memory, in which he stood out in simple dignity and beauty. Mr. Sanborn's biographical sketch gave the genealogical circumstances which made possible this rare union of the yeoman, philosopher and gentleman, and brought out vividly all the early incidents of his life which had moulded his character and mind. We trust this is an earnest of the full biography we may expect from this competent writer. Mr. Bartol with his quick flashing wit, bright as steel and tender as a caress, touched upon his traits of faith and hope and gentleness and the rare union in him of courage and sweetness. The tribute of Rev. G. Reynolds, of Concord, was very interesting. He did not profess to sympathize with the views of Mr. Alcott, but he bore noble testimony to his uprightness of life and high moral virtue, and to his value as a citizen, especially in his service as Superintendent of Schools. The value to the teachers of his presence and sympathy in the schools was especially dwelt upon. Mr. Wm. Garrison, Mr. John Albee, and his old friend Mr. Warston Watson read carefully prepared papers, giving their personal recollections and their estimate of his genius and character. It was reserved for Mr. Wm. L. Harris to discuss "The Philosophy of Mr. Alcott" and it is needless to say that he did so with masterly power. He showed him to have been a genuine Neo-Platonist, but maintained that he did not accept his solution of the Universe from the authority of a Master, but because it was worked out in his own soul. By what books read in youth he was influenced, was an interesting question, but from whatever source the first suggestion of his philosophy came, he made it fruitful and long in his own thought. Not the least interesting part of the exercises was the spontaneous tribute to Mr. Alcott by young men to whom he had been an inspiration and help, and who gratefully remembered how generously he had given to them of his time and sympathy and thought. The day was one long to be remembered, for it was almost perfect without a jarring tone to mar its harmony. It fitly closed Mr. Alcott's "School of Philosophy." How shall it be re-opened?

#### SAYINGS OF THE SEVEN WISE MEN.

Cleobulus—Moderation is best.

Periander—Restrain anger.

Pittacus—Nothing too much.

Solon—Consider the end of life.

Bias—The majority are the worse.

Thales—Avoid being a security.

Chilon—Know thyself.—[Quoted from the Greek Calendar.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XX.—Continued.

Again did the ripened ears of corn wave gently under the autumn breeze, when Ilse went with her husband to the home of her childhood to visit her father. A year abounding in happiness, but not free from pain, had passed. Her own life also had been a little history in which she had experienced peace and strife, progress and weakness. Her pale cheeks showed that she had encountered suffering, and her thoughtful countenance portrayed the serious thoughts that had passed through her mind; but when she glanced at the weather-beaten church, and fixed her eyes on the dark roof of her father's house, everything was forgotten, and she felt again as a child in the peaceful home which now appeared so refreshing and comforting. The farm-people thronged round the gate; and her sisters rushed to meet her, and her father, towering above all, helped her and her husband out of the carriage. She clasped every one of them in a silent embrace; but when little Franz sprang up to her, she pressed him to her heart, and, losing all her composure, burst into tears, and the father was obliged to take the child from her arms.

They could only pay a short visit, for his professional duties compelled the Professor to return home soon; and though he had proposed to Ilse to remain longer with her father, she declined doing so.

The father looked searchingly at the manner and countenance of his daughter, and made the Professor tell him repeatedly how rapidly and easily she had made herself at home in the city. Meanwhile Ilse flew through the farm-yard and garden out into the fields, again gambolling with her little sisters, who would not let go her hand.

"You are all grown," she exclaimed, "but my curly head most of all—he will be like his father. You will be a country gentleman, Franz."

"No, a Professor," answered the boy.

"Ah, you poor child!" said Ilse.

The laborers left their work and hastened to meet her, and there were many kind greetings and questions: the head carter stopped his horses, and the grey mare tossed her head. "She knows you well," said the man, cracking his whip gaily.

Ilse went into the village, to pay a tribute of respect to the dead and to visit the living. It was with difficulty that she could get away from the invalid Benz, and when at last she did so, he called for his slate, and with trembling hands gave expression to his joy in poetry. She then made a careful inspection of the farm-yard. Accompanied by a train of maids, she walked between the rows of cattle, in spite of her

fashionable dress, like the legendary Frau Berchta, who scattered blessings throughout the stable and house. She stopped before every horned head; the cows raised their mouths to her, lowing; and there was some important news to tell of each. The maids proudly showed her the young calves, and begged her to give names to the grown-up heifers—for the proprietor had desired that these young ones should be named by Ilse—and she gave them the distinguished names of Kalypso and Xantippe. All was familiar, all as formerly, and yet at every step there was something new to eye and ear.

Clara showed her household accounts: the young girl had kept them admirably. The praises which were bestowed upon her by the house-keeper and by the dairy maid, in confidential conversations, gave Ilse great pleasure, and she said: "Now, I am quite satisfied you can do without me here."

Towards evening the Professor sought his wife, who had been absent some hours. He heard the noise of the children by the brook, and guessed where Ilse was. When he turned round the rock by the cave he saw her sitting in the shadow, her eyes turned to her father's house. He called her name, and stretched out his arms towards her; she flew to his bosom, and said, softly: "I know that my home is in your heart; bear with me, when old recollections crowd upon my mind and move me deeply."

At night, when her father conducted the Professor to his bedroom, still conversing with him upon business and politics, Ilse sent her sister Clara to bed, and seated herself in her chair. When her father came in to fetch his candle from the table, he found Ilse again in her old place, waiting to bid him good night, while she handed him the candle stick. He placed it on the table, and, walking up and down the room, as he had done of yore, began, "You are paler and more serious than you used to be. Will that pass?"

"I hope it will," replied his daughter. After a time she continued, "They believe and think very differently in the city from what we do, father."

The father nodded. "That was the reason I was anxious about you."

"And it is impossible for me to free myself from painful thoughts," said Ilse, softly.

"Poor child," said the father, "it passes my powers to help you. For us, in the country, it is easy to believe in a father's care, when one goes across the fields and sees the growth of everything. But let a simple countryman say a word in confidence to you. Moderation and self-renunciation are necessary in all earthly concerns. We are not better in the country and more sensible because we care little for what is mysterious to man. We have no time for subtle inquiries, and if a thought alarms us, our work helps to dispel our doubts.

But thoughts return frequently. I have had days—and have still—when my brains have been on the rack, although I knew that no good would come of it; therefore I now endeavor to keep such thoughts away. This is prudence, but it is not courage. You are placed in a sphere in which bearing and reflecting are unavoidable. You must struggle through it, Ilse. But do not forget two things: on difficult subjects men take very different points of view, and on that account they have, from the most ancient times, hated and slaughtered each other like cannibals, merely because each considered himself in the right. This should be a warning to us. There is only one thing effectual against doubts: to do your duty and concern yourself with what lies in your daily path; for the rest, do not despair because one thinks differently from another. Are you sure of your husband's love?"

"Yes," replied Ilse.

"And have you a thorough respect for his conduct to yourself and others?"

"Yes."

"Then all is well," said the father; "for a tree is known by its fruits. As regards the rest, do not worry about the present or the future. Give me the candle, and go to your husband. Good night, Frau Professor."

#### CHAPTER XXI.

In the large hall of the University a select audience was assembled; state and municipal dignitaries, and men of learning, and students, were constantly streaming backwards and forwards through the doors of the great entrance. The wives of the Professors sat above in the gallery: Ilse was in the place of honor, in the middle of the front row, with Laura. This was a great day for Ilse, for the splendor of the highest academical dignity rested upon her husband's head. Felix Werner had been chosen Rector Magnificus, and was now about to enter upon his office.

The instructors of the University walked in a long procession into the Hall; before them went the beadles in their antique dress of office, carrying great maces in their hands; the gentlemen themselves walked in the order of their several faculties. Theology began the procession, and Philosophy closed it; the latter, both from the number and importance of its members, was the strongest division; altogether they formed a stately company; by the side of some nonentities went men of the highest repute, of whom the country might well be proud; and it was a pleasure to every one to see so much learning assembled. These great minds, however, did not make a very dignified appearance in the procession: they kept their ranks badly; many looked as if they were thinking more of their books than of the impression made by their appearance on the public; one had come behind time—it was

Raschke—he entered carelessly, running behind the tutors and nodding familiarly to his acquaintances. The procession was received by the Academical Choir with a Latin song, solemn, but unintelligible. The Professors ranged themselves on their seats; the ex-Rector mounted the platform, which was decorated with flowers; he first made a learned speech upon the benefits which medical science had long ago derived from the wandering tribes of Arabia, and then read a report of the academical events of the last year. The discourse was fine; the proceedings were imposing; the distinguished guests from the city and government sat immovable; the Professors listened attentively, the students rattled only a little at the door; and if at times from the high ceiling of the great hall the spirit of weariness waved its great bat-wings before the eyes of the audience, as is inevitable at academical ceremonies, Ilse to-day did not remark it. When the Rector had ended his discourse, with a graceful wave of his hand and some complimentary words, he invited his successor to join him on the platform. Felix did so. The Rector took off his cap and the golden chain and mantle, which looked like an old regal mantle, and put them all upon his successor, with warm wishes and expressions of esteem. Laura whispered to her neighbor: "If our Professor had a sword at his side he would look like one of the Electors in the pictures up there." Ilse assented joyfully; it was precisely what she thought. Now Werner came forward with his scarlet mantle and chain. The beadles crossed their maces on both sides of the chair, and the new Rector majestically began an address to the Professors and students, in which he begged for their good will and promised good government. Again the Academical Choir began a Latin song of triumph, and the procession of University instructors retired into the neighboring room, where the Professors surrounded their Rector, shaking hands with him, and the beadles packed the scarlet mantle and chain in a chest, to be preserved for future occasions. Ilse, too, received the congratulations of the ladies, who placed themselves on the gallery steps and greeted her gaily as "Magnifica."

As soon as she got home, Ilse threw her arms round her husband's neck, and told him how stately he looked in his grand attire. "What the gipsy said," she exclaimed, "has been fulfilled to-day: the man whom I love has worn a prince's dress; I greet you, my Prince and Lord."

It was on the afternoon of this great day that the visit of the Hereditary Prince was announced. Ilse once more looked into every corner of her bright dwelling, that she might experience no disgrace as mistress of the house, and made her husband instruct her as to the right form of speaking to an illustrious

rince; "In order that I may know what to say if he addresses me. I am anxious, Felix, for it is a great thing to meet the future Sovereign of one's country."

As the clock struck, the carriage drove up. Gabriel, in his best coat, conducted the gentlemen to the Rector's room. Meanwhile Ilse walked up and down, burning with expectation. It was not long before her door was opened, and two gentlemen entered, introduced by her husband. The Prince was of a slight figure, medium height, black hair, with small face and features; over the delicate lips there was a dark line, which showed the beginning of a mustache; his carriage was awkward and embarrassed, and he gave one the impression of being a delicate and weak man. He seemed confused when he approached Ilse, and he told her, in so low a tone that she could scarcely make out his words, how much he rejoiced in meeting with a countrywoman.

His shy manner gave Ilse courage; she was touched by the countenance of her young Prince, and accosted him: "We in our country cling to our home, and as I now have the opportunity of making your Highness's acquaintance, I venture to say that I remember your Highness. You were quite a young gentleman, and I was only a half-grown girl when I first saw you in your father's capital. Your Highness was sitting on a very small horse; whilst my father and I made our obeisances, the horse stood still and would not go on. You looked kindly at me, just as you do now. I had a couple of roses in my hand, and, as you were our young Prince, I offered them to you. But you shook your head and could not take them, as you had to hold the bridle, and I believe you were a little timid about your horse: but the horse poked its head into the flowers. Then a tall man in uniform rode up and held the horse, and we retreated. You see I remember it all, for it was an important thing for a country girl to remember.—But will your Highness do me the honor to take a seat?"

The Prince's attendant, the Chamberlain von Weidegg, addressed Ilse courteously; he was a man of middle age, tall, of good address, and not bad looking; he took the lead in the conversation, and spoke pleasantly of the hills and woods of their common country; it was an agreeable interchange of words on every day subjects. The Prince was silent, played with his eyeglass, and looked cautiously and wonderingly at the stately wife of the Professor, who was sitting opposite him. At last the Chamberlain inquired at what hour Ilse received strangers, and expressed a wish that the Prince and he might be allowed occasionally to visit her. "On account of the few persons with whom my illustrious Prince can associate in this city, a house in which he may expect not to be treated as a stranger will be particularly acceptable to him." This was very

pleasant and courteous, and when the Professor had accompanied the strangers to the entrance, he said to his wife, "They appear to be very amiable."

"I had imagined my Prince to be quite different, Felix, bold and haughty; but he has not even a star on his breast."

"It must have been in his pocket," said the Professor, consolingly.

In a short time the Hereditary Prince and his Chamberlain found out that this good treatment was very pleasant. The Chamberlain proved himself an agreeable man; he had travelled much, had experience of all sorts, had seen much, and read a good deal on various subjects; he collected autographs, had no vices and no bad habits. During a long sojourn in Rome he had been intimate with old acquaintances of the Professor, he had wandered through the ruins of Pompeii, and showed a warm interest in the details of old Roman houses. Besides this he understood how to listen and how to ask questions, and could, with decorum, tell doubtful anecdotes of people of note. His conversation was agreeable to the Professor, he was welcome at Ilse's tea-table, and liked by her guests. It seemed also to give him pleasure to converse with the learned men; he visited the Doctor and examined his old wood-cuts; he treated Professor Raschke with considerate politeness, and, with his Prince, accompanied the Philosopher on a fine winter evening to his distant dwelling, and during the walk Raschke imparted to them very interesting observations upon plants.

It cannot be said that the Hereditary Prince was much at home among the Professors; he listened with toleration to their conversation, as became an academical student, and said the right thing at the right time; but he showed by an impatient jerk of his lorgnette that he would much have preferred any other kind of entertainment.

Ilse was not pleased when he fidgeted with his glass, for she wished that he should conduct himself with dignity among other men, and she seemed to feel as if the gentlemen would reproach her because the Prince took no real interest in serious subjects. As mistress of the house, therefore, she was very attentive to him; she ventured to advise him not to drink his tea too strong, and prepared it for him herself. The Prince was pleased with this, and enjoyed sitting next to her or watching her perform her duties at the table as hostess. It was only with her that he ever lost his cautious reserve; he talked to her of the remarkable things he had seen in the town, and when he had nothing to say, he assisted her in her duties; he placed the cream jug before her, and always passed the sugar-bowl when he thought that Ilse wanted it.

(To be continued.)

## BOOK REVIEWS.

TWO COLLEGE GIRLS. *Helen Dorset Brown*. Boston: Ticknor & Co.

A reprint, in the popular and acceptable paper series which the above firm is issuing, of a well-written story dealing with the life of two girls of opposite tastes and temperaments, in college. A high theme, sparkling dialogue, and life-like characterization mark this novel and will win for it many appreciative readers. C. P. W.

THE STUDY OF POLITICS. *W. P. Atkinson*. Boston: Roberts Bros.

We have here a printed copy of a lecture forming part of an introduction to a course on Constitutional History, given at the Institute of Technology. It is a spirited appeal to thoughtful citizens for a more earnest and active co-operation in the duties and responsibilities which fall to them as the governing populace of our republic—a timely theme and of growing interest. C. P. W.

HANNAH MORE. Famous Women Series. *Charlotte M. Yonge*. Boston: Roberts Bros.

This is an interesting account of a writer and woman who held an honored position in the ranks of letters during her lifetime, but whose name is slipping from the memory of the present generation. Miss Yonge has given us a very full and interesting account of her subject, and with it much valuable information on kindred themes of constant interest to the literary student. C. P. W.

MODESTE MIGNON. Balzac. Translated by *Katharine Prescott Wormley*. Boston: Roberts Bros.

The day has past for a critical review of an author like that of the *Comédie Humaine*. The enterprising firm which is re-printing the works of Balzac in the present handsome and worthy style, deserves the thanks of all readers of good fiction. Modeste Mignon is full of the author's peculiar characteristics, faithful description of detail, true and lively characterization, noble sentiments and a clear, terse style, often falling into the epigrammatic, so that Balzac, as he is more widely read, is likely to become one of the most quoted of authors. C. P. W.

*Mind* for July contains a number of highly interesting essays, the first of which is an exposition of the "Herbartian Psychology," by G. F. Stout, being the first of a series "intended to draw attention to that movement in the history of Psychology in Germany, which originated with Herbart and Beneke, and to compare it critically with the work of the Associationist School in England." A. F. Shund contributes a paper on "Space and Time," B. Bosanquet on "The Philosophical Importance of a True Theory of Identity," The others are a very suggestive essay on "Reality and Thought," by F. H. Bradley, and on "The Lesson of Neo-Scholasticism," by F. Winterton. The Discussions are upon "The Kantian Conception of Free Will," by Prof. H. Sidgwick, "Impersonal Propositions," by J. Venn, "Hallucination of Memory and 'Telepathy,'" by E. Gurney, and an important paper on "The Psychological Theory of Extension" by the editor, in which he criticises the views of Mr. Ward's article in Vol. XX, of the *Encyclopedia Britannica*, and those of Prof. James in the last volume of *Mind*, in the course of which he condenses a great deal of truth in a small space in the statement that "the mistake of the space-theorists, generally, is to seek for an extension that is extension of nothing at all." The Critical Notices are on H. Taylor's "Morality of Nations," by Prof. W. Wallace, G. S. Morris's "Hegel's Philosophy of the State and of History," by D. G. Ritchie, W. Wundt's "Grundzüge der physiologischen Psychologie," by J. McK. Cabbett, and F. Tonnies' "Gemeinschaft und Gesellschaft," by H. W. Blunt. There is a copious list of notices of New Books, and a very interesting critical note on "Prof. Ladd on Body and Mind," by G. F. Stout, and one on "Aristotle in Jewish Philosophy," etc., etc. F. S.

## NOTES.

A paper by Mrs. Ednah D. Cheney, entitled "Reminiscences of Mr. Alcott's Conversations," will appear in the next issue of the OPEN COURT.

Félix Alcan of Paris is issuing a French translation by M. Burdeau, of Schopenhauer's main work: *Die Welt als Wille und Vorstellung*. The publication when complete will comprise three volumes. The first volume is now ready, and is a reproduction of the original work as published in Leipzig, in 1819. The second and third volumes, to appear towards the end of the year, will include all additions and amplifications afterwards made by Schopenhauer upon the original theme. The translation will be without omissions or abridgements of any kind. The excellencies of *Le Monde comme Volonté et comme Représentation* need no further recommendation than the fact of its appearing in the *Bibliothèque de Philosophie contemporaine*.

In No. 49, the issue of Aug. 2, the OPEN COURT will begin a series of essays by A. Binet, the celebrated French Psychologist, upon the Psychic Life of Micro-Organisms. The essays are a translation of two articles that appeared in the *Revue Philosophique* of November and December, 1887. Monsieur Binet presents in an attractive and lucid manner the results of the latest investigations into the psychical life of animalculæ. Heretofore, the results existed only in scattered reports, and were practically inaccessible. They are now presented for the first time in a carefully collated form. The eminence that M. Binet has attained in the province of physiological psychology in connection with his distinguished collaborators, Th. Ribot and Ch. Féré, is sufficient recommendation of the worth of these contributions. The OPEN COURT has secured from Félix Alcan, publisher of the *Revue Philosophique*, the cuts and plates that accompanied the articles when originally published.

We wish to call our readers' attention to a young ladies' school which distinguishes itself from its numerous sister institutions in several important respects. We mean the Minerva Institute, formerly in Chicago, but recently removed to Ravenswood, Illinois, a charming suburb, near enough to the city to ensure the enjoyment of all metropolitan advantages while offering to its pupils many attractions that the country alone affords. Mme. von Ende, the principal of the establishment, is a lady of unusual attainments, not only conversant with every topic of science, literature and art, but deeply interested in educational and moral reform. She is therefore not merely concerned with increasing the personal accomplishments of her charges, but endeavors to make them better and more useful women. The school is based on an entirely secular basis, the catalogue stating that "unlimited toleration in religious questions is one of the leading principles" and that sectarian influence is therefore excluded; but ethical culture, which is adaptable to all creeds, takes the place of religious exercises, and the poetic and emotional side of man's nature receives the nourishment it craves for in the reading of and conversing on the works of great poets and thinkers. Inspired by the ideas of the "new education," which commands respect for individuality instead of crushing it by mechanical routine work, and which demands manual training as well as mental, the school gives its pupils not only an education which fits them to enter college or adopt the profession of teaching, as several of the graduates have done, but it prepares young girls to fill honorably their place, whether it be in the narrow limits of a quiet home, or that world of its own, society. As thoroughness is the end and conscientiousness the means to that end, in all that the principal and the faculty of that school undertake, it is hoped that their earnest work will be rewarded by success.

### WHAT MIND IS.

Prof. E. D. COPE.....In No. 40.  
THE NATURE OF MIND.

By the Editor of THE OPEN COURT. No. 40  
Professor Cope gives in clear and comprehensive outlines his view of mind; he opposes Materialism and Dualism, stating that "the situation is monistic." However, "as the amount of thought can most assuredly be measured, but the quality of thought can not," the eminent American scientist concludes that "consciousness has a field of its own where it ranges free from the bonds of energy." The directive element (will and mind) is qualitative not quantitative and controls the movements of the non-mental environment. "This statement may be called occultism," Prof. Cope adds, "and I suppose justly. But such is the fact."

### YOU SHOULD READ

## AMERICA. WHY?

Because it is the only paper in America that advocates American rule in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson,  
Sen. Teller, Sen. Mitchell, Sen. Dawes,  
Sen. Stewart, Hon. Theodore Roosevelt,  
Seth Low, Hon. Andrew D. White,  
Ella Wheeler Wilcox, Bishop Cox,  
Hon. James Russell Lowell, Admiral Porter,  
Charles Dudley Warner, James Whitcomb Riley,  
Frank R. Stockton, Edgar Fawcett,  
J. T. Trowbridge, Edgar Saltus, Robert Grant,  
Julian Hawthorne, W. Clark Russell,  
and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy, and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

—Also—

### SEEDS and PLANTS.

C. R. ORCUTT, Publisher,  
The West American Scientist,  
SAN DIEGO, CALIFORNIA.

In opposition to Prof. Cope, the Editor explains his view of mind. The qualitative faculties are a matter of form. Form is the essential characteristic of mind, and a superior mind indicates a superior form of brain structure. Form is an abstraction from reality and has by itself no efficacy. M. Ribot, the founder of the French school of experimental psychology, is quoted in support of the fact that consciousness by itself is not an effective factor in the motion of our limbs. "The consciousness of mental states may be indispensable for a proper direction of our will, but it does not possess motive power. Prof. Cope's view is considered inconsistent because leading to dualistic statements and to occultism.

A letter from Prof. E. D. Cope, which has reference to this discussion, is published in No. 42.

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order to live, in order to live well and be blessed.

he religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

## AGNOSTICISM.

By MONCURE D. CONWAY.....In No. 47.

Mr. Moncure D. Conway, in reference to the philosophical exposure of Agnosticism in the editorial article of Nos. 43 and 44 of THE OPEN COURT, declares that the Unknowable cannot in the least concern the religious nature. Only weariness of wing can have brought free thinkers to seek rest on this raft. Religion does not follow abstract and vague gods, it follows Jesus, Buddha, Mary, who may be known and loved. On the truth and moral value of these great figures, man can base his life. Mr. Conway concludes with the remark that the ethical side of monism has not as yet been made clear. Nature seems predatory and cruelly impartial between good and evil. Adherents of error survive more comfortably and increase more extensively than the disciples of truth. May it not be more truly said that there is a moral law in man to which nature must conform in order to be elevated and transfigured to a nobler existence? Mr. Conway's critical remark if it were unanswerable from the standpoint of Monism would drive religion and philosophy back into the dualism and supernaturalism of former times. And truly the supernatural, if it is justifiable at

all, must be recognized in the moral nature of man, unless man is proven to be a part of nature. The editor's answer to Mr. Conway's criticism, in the same number, expatiates on the Oneness of Man and Nature, thus showing that humanity, culture and civilization are but a higher stage of the natural, and that morality does not stand in contradiction to, but is an observing of and a conforming to the cosmical order of the All.

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychological connection of the whole has been attained in a much higher degree.

FR. HELBIG.

In Nos. 22, 23 and 24 is a deeply philosophical essay, "The Fool in the Drama," by Franz Helbig, another German scholar whose works refer to the History of Civilization. In this essay are shown in a delightful way the wisdom and the folly of the fool in the drama, and his value, not only to the body politic, but to the morals of human life. In the folly of the fool in the drama we see our own folly; and the satire of the fool administered in jest leaves a lesson behind it that makes us think seriously when the laughter is done.

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."

The reader should compare the views of Mr. Powell with Max Müller's essay on the subject of language, published in *THE OPEN COURT*, Nos. 9-11 and 12-14, and lately republished. Max Müller defines thought as "addition and subtraction." What we add and subtract is thought, which consists of (1) sensations, (2) percepts, (3) concepts and (4) names. These four he claims to be inseparably united. E. P. Powell's definition of language is more comprehensive, including the communicativeness of the lower animals. His view is different from Max Müller's, but by no means contrary.

For further information on the subject of language the reader is referred to the editorial Monism and Philology, and Ludwig Noiré's important essay "The Origin of Reason," both published in No. 33.

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. EINET.

Translated from the French by άρρκ.

PART I.

The study of microscopic organisms has hitherto been somewhat neglected by students of comparative psychology. Naturalists who have devoted their attention to the study of these beings, have collected a great number of interesting facts concerning their psychic life; but these facts have not yet been critically examined and collated; they are scattered in reports and publications of all kinds, where the psychologist never dreams of looking for them. We shall endeavor to make him acquainted with a part of this wealth.

Under the name micro-organism are included all those beings which by reason of their extreme smallness and simplicity of structure represent the lowest stages of animal or vegetable life; they constitute the very simplest forms of living matter, and consist of one single cell.†

Some inhabit fresh and salt waters, serving as food for a great many other organisms, or contributing by the aid of their calcareous or silicious skeletons to the formation of continents. Others live as parasites in the organs of animals and plants, and induce more or less serious disorders in the constitutions of the organisms they have penetrated. Others, again, acting like ferments, produce important chemical modifications in organic matter in the course of decomposition.

A great number of classifications for the methodical arrangement of these beings has been proposed; but not one of them is altogether satisfactory; and that stands to reason. If a natural classification is always a complex piece of work in the case of the higher animals which differ from each other in important features and between which a comparison can be instituted, the difficulty attending the classification of simple organisms which present only the slightest differentiations is still more difficult.

The principal division made is that which divides them into animal Micro-organisms or Protozoans and vegetable Micro-organisms or Microphytes.

The line of demarcation between these two kingdoms is far from being well defined; there are a great

number of micro-organisms *incertæ sedis*, which botanists usually place in the vegetable kingdom, but which zoölogists prefer to classify as belonging to the animal kingdom.\*

We give below a list of the most important groups of animal micro-organisms.

### ANIMAL MICRO-ORGANISMS.

INFUSORIA.	MASTIGOPHORES.	SARCODINES.	SPOROZOA.
Ciliates.	Flagellates.	Rhizopods.	Gregarinids.
Suctorina (Suckers)	Chaetognathellates.	Helliozoa.	Coccidia.
.....	Dinoflagellates.	Radiolarians.	Sarcosporidia.
.....	Cystoflagellates.	.....	Mycosporidia.
.....	.....	.....	Microsporidia.

We propose, now, to study the psychic life of these lower organisms, or, to speak in more general terms, their life of Relation. It is well known that the expression, the life of relation, comprehends essentially two distinct ideas: first, the action of the external world felt by the organism: or sensibility; secondly, the reaction of the organism on the external world: or movement. It is customary to apply to the union of these two properties the name irritability, which expresses the reaction of the micro-organism upon exterior forces. It is therefore held, and with reason, that every living cell is irritable, that is to say that it possesses the property of responding by movements to the excitations which it suffers.

In admitting then that irritability is the foundation of the life of Relation, and consequently also the foundation of psychology, we must nevertheless guard against comparing the autonomous cell of micro-organisms to a simple irritable cell. Although the body of these small beings may be equivalent to a simple cell, it would be an error to believe that their life of relation consists in a motory reaction consequent upon exterior irritation. At the close of our investigations into the psychology of Proto-organisms we shall see that, in these inferior beings which represent the simplest forms of life, we find manifestations of an intelligence which greatly transcends the phenomena of cellular irritability. Thus, even on the very lowest rounds of the ladder of life, psychic manifestations are very much more complex than is usually believed, and the conception of cellular psychology which some very

\* Translation copyrighted.

† The doctrine of unicellularity in regard to the Infusoria has been upheld by Sibold and Kölliker; the majority of naturalists have conceded it.

\* The best mark to distinguish the two kingdoms is the chemical nature of the enveloping membrane: in the case of vegetable organisms, the enveloping membrane is made up of a ternary substance, cellulose; while in animal organisms it is albuminoid in character.

recent authors have formed, seems to me a very crude analysis of the most delicate of phenomena.

In the great majority of pluricellular animals, the life of Relation is exhibited in a nervous system and in a muscular system. In Micro-organisms the same cannot be said to be the case: the greater part possess neither a central nervous system nor organs of sense; some even lack organs of locomotion. The functions of the life of Relation are performed by the entire mass of the body: many of the Protista, for example, have not a trace of an anatomically differentiated visual organ; it is the entire protoplasm of the elementary organism that is excitable by light, as it is also by heat or by electricity. In other Micro-organisms somewhat higher in the scale, a beginning of differentiation may be seen to make its appearance, giving birth either to some organ of sense or to some organ of locomotion.

We shall give a general description of these organs. The study of this first move in the work of differentiation is of great interest to comparative anatomy and physiology; no less interesting is it to psychology. Besides dwelling on these preliminaries of our work, we shall have occasion to note new and interesting facts.

# I.

## THE MOTORY ORGANS AND THE ORGANS OF SENSE.

*Motility.* From the schedule of the groups of animal micro-organisms which we have given, it will be seen that they are subdivided into four classes, the Infusoria, the Mastigophores, the Sarcodines and the Sporozoa. The distinction between these classes depends on the existence and the nature of the motor organs.

The Infusoria comprise the protozoa that move by the aid of vibratile cilia distributed in greater or less number over their body.

The second class, the Mastigophores, comprises those animals which move by the aid of flagella, that is to say by the help of long filaments.

The third class, the Sarcodines, comprises those animals which move by the aid of pseudopodia; which are projections of the substance of their bodies.

The fourth class, the Sporozoa, is characterized by the mode of multiplication: they are reproduced by spores. In the animals of this group, the special motor organs are wanting; these creatures therefore generally move very little, or they present only movements of which the principles are unknown.

We shall successively describe the pseudopodia, the vibratile cilia and the flagellum.

*The Pseudopod.* The formation of pseudopodia takes place chiefly in naked cells—in cells lacking an enveloping membrane, in the Sarcodines in general. They can easily be studied in the *Amœba princeps*, a

microscopic animal which is found in abundance in fresh water containing organic matter in a state of putrefaction. It has the aspect of a small gelatinous mass, irregular, formed of a colorless substance, the protoplasm. The chemical nature of protoplasm is still very imperfectly understood; it is only known that it is the result of a mixture of albuminoid matters, with an addition of water and mineral elements. In the protoplasm of the *amœba* exists a small rounded and refracting mass, containing one or two bright corpuscles in its interior; this small mass is called the nucleus, and the corpuscles the nucleoli.

The form of the body of the *amœba* is rendered very irregular by the fact that certain parts of the mass lengthen, and form short and rounded protuberances which are designated by the name of pseudopodia. It is by means of these pseudopodia that the animal moves; it emits them in the direction in which it is going, then it retracts them, while other parts of the mass are in their turn elongated. The whole body moves by creeping. The *amœba* in moving has the aspect of a drop of oil moving along. To explain the mechanism of this movement, it must be supposed that the extended pseudopod seizes some point of support with its free end, then, in contracting, draws the entire mass of the body up to this. But it is difficult to understand what the cause of the elongation of the pseudopodia is. It has been supposed that the protoplasm is endowed with great elasticity and that the elongation is the return of this substance to its primitive form. That is not the explanation given by M. Rouget. The learned professor of the Museum has been kind enough to write out the following note for us, in which he recapitulates his opinion:

"Every time that a protoplasmic organism dies, or is subjected either to a strong electric excitation, or to a relatively high temperature ( $+45^{\circ}$  to  $+50^{\circ}$ ) the pseudopodia are retracted and re-enter into the mass, which assumes a globular form; the same is the case in the protoplasm of vegetable cells, the inter-cellular reticulum of which breaks in receding, or else the mass of protoplasm divides into spherical bodies. These states of retraction are the analogues of *muscular rigidity*, and like it represent the condition of *maximum* contraction in the protoplasm—nevertheless the style of the Vorticelles (*Carchesium*) which is a protoplasmic formation, under the same conditions, remains in a state of permanent retraction. It follows from this that the emission of the pseudopodia, *their elongation*, cannot in any case be considered as a direct act of the contractility of the protoplasm.

"The production of the pseudopodia, one of the most difficult problems, cannot, in my opinion, be explained, except in the following manner: All protoplasmic masses, and especially the *amœba*, consist of

two parts, an enveloping membrane or ectosarc, viscous and elastic, and the central liquid contents holding granules in suspension.

"From the time of the apparition of a pseudopod, a current of liquid is visible which penetrates into the pseudopod and which seems to contribute to its elongation. It is very evident that the liquid is passive, that it penetrates into the pseudopod only because, pressed upon from all sides, it finds less resistance there. I think that the (in appearance) homogeneous hyaline substance of the pseudopod is also a species of *hernia* of the ectosarc, resulting from a diminution of the elastic resistance at the point where it appears, with an increase of elasticity or of contractility (to me two modalities of the same property) in those parts of the ectosarc where pseudopodia are not produced. When the contractility or the elastic tension of these parts diminishes, and returns to its original state the pseudopod re-enters into the mass. Add to this that, in an amœba of large dimensions, *Amœba terricola*, it has seemed to me that the most external membrane of the ectosarc showed stria of a granular appearance which may be identical with the stria or contractile fibrils of the ectosarc of the ciliated infusoria, *Stentor Spirostomes*, *Bursaria*, etc." (May 20, 1887.)

The pseudopod does not represent a permanent, differentiated organ of locomotion; it is produced by a simple prolongation of the mass of the body, which can take place at any point whatever, and when the act of locomotion has been accomplished, this prolongation re-enters into the common mass without leaving any traces of its emission. In other animal species, for example the *Petalobus* of Lachmann, initial traces of differentiation of the pseudopodia have been observed; they always form at the same point of the body, on a level with the anterior part; but, in spite of this constant localization, the motor organ has only a transitory existence; it is produced at the moment it is needed, and disappears into the mass of the body, when the movement has been executed. In the *Actinophrys* there is a still greater progress: the numerous pseudopodia emitted by this animal, and which have the form of filaments, are permanent organs with definite functions.

*The Vibratile Cilia.* The vibratile cilia are short, extremely thin, homogeneous filaments which are agitated by a vibratory movement. These are distinctly differentiated organs of locomotion. They have, moreover, several functions: firstly, they enable the animal to move about in the liquid; secondly, they serve it as an organ of prehension; thirdly, they permit a renewal of the water which furnishes the necessary air for respiration to the animal; perhaps they also serve as organs of touch.

The vibratile cilia lend to the Infusoria their peculiar

character and enable them to be distinguished from all the other Protozoa. Cilia are also found in vegetable species when young, and in the larvæ of Coelenterates, of mollusks and of worms. But among the Protozoa, it is the Infusoria alone that are ciliated. The cilia are distributed in various manners, differing according to the species. In the *holotricha*, they are distributed regularly over the whole surface of the body, and almost all have the same length; in the *Heterotricha*, they also cover the whole surface of the body, but they are unequal in length. To this group belong the *Stentors* which have long cilia inserted around a circular surface, extending almost to the mouth. This surface is a rotatory organ, analogous to that of the rotifers; it produces eddies in the water and thus causes the flow of foreign bodies to the mouth: these animals have the rest of their bodies covered with fine cilia. In the *Hypotricha* the cilia are located on the ventral surface of the body and aid in locomotion. In the *Peritricha*, they form a circular or spiral row on the anterior part of the body, and lead to the mouth. This is observed in the *Vorticels*, sessile species which have no other cilia than those which are used for the prehension of food; the rest of the body is bare.

Much has been said about the morphological significance of vibratile cilia; several micrographists have held that the cilia are attached to the enveloping membrane only, and have no connection whatever with the protoplasm. That was notably the opinion of Robin; it is entirely wrong. The cilia are never simple prolongations of the cuticle; they have their root in the protoplasmic substance; they pass through orifices in the cuticle, which consequently is pierced by a multitude of small holes. Engelmann, in recent observations, has been able to trace the extremity of the vibratile cilia into the interior of the protoplasm; he made this observation on the marginal cilia of the *Stylonichia*; from each of these threads he has seen separate a pale fibre, which moves along almost directly beneath the cuticle in a direction perpendicular to the lateral edge of the body; towards the median line of the ventral face the fibres are often laid bare, because the body of this Infusory voids its protoplasmic substance; there the fibres have the aspect of tightened threads. Engelmann sees in this observation a confirmation of the opinion that the bodies of infusoria are formed of one single cell, because, according to other observers, there exist also in vibratile cellulæ filiform stria which seems to be a continuation of the cilia, and which traverse the protoplasm of the cell throughout its whole length.

We might add to this direct observation several other facts showing that the vibratile cilia are indeed prolongations of the plasm. Under the action of

re-agents the cilia act like the cellular protoplasm; they are coagulated by the acids and dissolved by weak alkalies, while the cuticle offers a greater resistance to these same agents.

These vibratile appendices are not without analogy with the pseudopodia of naked cells; Dujardin, a French naturalist, demonstrated this in 1835, although efforts have since been made to bestow the honor of this discovery upon the Germans. Dujardin has proved that the amoeboid movement and the ciliary movement are only two manifestations of the contractile power of protoplasm. In fact, if instead of examining a pseudopod with lobed outline like that of the amoeba, we observe the slender and filamentous pseudopodia of the Foramenifera, we see that the extremity of the filament is agitated by the same vibratory movement as the vibratile cilium.

All the transitions from the fine and delicate cilia to the large cilia, tapering in form like a stiletto, which have been called cirri, have been observed; moreover these cirri are formed of agglutinated cilia; by the aid of certain re-agents they have been dissociated.

An observation of a ciliated infusory, the *Didinium nasutum* (see the illustration further on) made by M. Balbiani, shows that the movement of the cirri is not an involuntary movement like that of the cilia of the vibratile epithelium, with which it has often been compared, but that it is completely under the control of the will of the animal, like the organs of locomotion of animals much higher in point of organization.

"The *Didinium* has two rows of equal, and rather strong, vibratile cilia, disposed transversely around the body, in the form of two belts or crowns. The rest of the body of this animal is entirely stripped of cilia, but its double vibratory belt suffices to enable it to execute the most rapid and most varied evolutions in the water. Not only does it swim forwards and backwards with perfect ease, but the progression in both directions is always accompanied by a rapid rotatory movement of the animal about its longitudinal axis, similar to that observed in other infusoria that have a cylindrical body. The two rows of cilia always act in union during the locomotion, and the direction which the animal gives to them, determines the direction in which it wishes to move. In the movement for-

wards, all the cilia are directed toward the anterior part of the body (fig. 1); when it swims backwards, they are reversed (fig. 2). The infusory thus rapidly makes its way across the field of vision by jerks; from time to time it suddenly stops, all the time continuing to turn around rapidly on its axis on the one spot, during which movement the ciliated belts beat the water in opposite directions, the anterior ones being turned forwards, while the posterior are turned backwards (fig. 3). The result of this is that the effects of these small locomotive apparatuses neutralize each other in the same manner as two helices acting in opposite directions, and that the animal remains stationary, while all the time turning rapidly about itself, sometimes horizontally, sometimes vertically on its conical appendage, just as on a pivot."

Certain Infusoria, for example the *Condyllostoma patens*, which has been thoroughly studied by M. Maupas, possess at the same time the two kinds of appendages, the cilia and the cirri. The former, which cover the dorsal surface of the animal, are fine, very dense and animated by a rapid and unceasing vibratile movement. The cirri, which cover the ventral surface are placed apart; furthermore they do not vibrate rapidly; their movements are slow, and when the infusory moves, one can see them move successively on the plate of glass and support themselves there, in the manner of a foot, to make the body advance. When the animal stands still, the cirri are absolutely immobile, while the cilia continue their vibratile movement. This observation which can equally well be made of the Oxytrichid, shows that the vibratile cilia are the organs of involuntary movement, and that the cirri are more directly subject to the will. The fact is demonstrated by the experiments of Rossbach, who observed that, under the influence of the falling of the temperature (from  $+15$  to  $+4$ ) or of the rising of the temperature (from  $+35$  to  $+40$ ) or under the influence of various chemical substances, the large cilia, the organs of voluntary movement are paralysed, while the fine and delicate cilia continue their movements, which do not seem to be under the influence of the will. These movements alone cause the whole body to rotate until the vibratile cilia are in their turn paralyzed.

Besides the cilia and the cirri, other appendages in the form of membranes are found among the Infusoria, appendages which are attached to the anterior part of the body or the peristome; these membranes serve the purpose of causing eddies in the water, which bring the floating alimentary particles into the mouth. They are modifications of the vibratile cilia; these membranes like the cirri are formed of agglutinated cilia.

(To be continued.)

Fig. 1.—*Didinium nasutum* (Balbiani). Figure representing movement forward. The cilia are all turned towards the front part of the body.

Fig. 2.—*Didinium nasutum* (Balbiani). Outline of movement backwards. The cilia are all turned towards the back part of the body.

Fig. 3.—*Didinium nasutum* (Balbiani). A sketch of rotatory movement in one spot. The cilia of the anterior belt are directed forwards, while those of the posterior belt are directed backwards.

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

BY MRS. EDNAH D. CHENEY.

PART I.

*Gentlemen and Ladies.*\*—It is a difficult task to give any idea of Mr. Alcott's conversations to those who never had the happiness of listening to him, for he was unlike every other in the charm and fascination of his speech. He delighted in conversation, and celebrated it ever as the highest form of human expression. Lowell, in the "Fable for Critics," has hardly caricatured him in saying:

"For his highest conceit of a happiest state is  
Where they'd live upon acorns, and hear him talk gratis.  
And indeed, I believe, no man ever talked better;  
Each sentence hangs perfectly poised to a letter;  
He seems piling words, but there's royal dust hid  
In the heart of each sky-piercing pyramid."

This comparison to a pyramid is striking, because most people think of Mr. Alcott's speech as more like a free balloon, with no attachment to earth—but I find in an old letter this remark of a critic: "The company that night formed a pyramid, whose base was deep in earth, but whose summit bathed itself in the clouds."

Little justice has been done to the keen sagacity, the fine perception of character, the wit, the satire, even, I may say, audacity of Mr. Alcott's speech, which made his conversation not only elevating, but exhilarating, for these traits were always in subordination to the prevailing quality of high spirituality which left the deepest impression upon you. I find such expressions as these written at the time of hearing him:

"That atmosphere of thought was like sea air to an invalid."

"Mr. Alcott's conversation was a great deal to me, it led me into the Universal, out of myself. It had the same effect that Genius always does." "He was more genial, more humane than I expected." Again, "There is a sort of charm in his voice which, like the music of a song, diverts the attention from the words." And, "I feel like a child with him, and am quite sure that he will accept all with gentleness and forbearance."

At times he was a pure rhapsodist and carried you along by the music of his thought and speech, which it was impossible to define. Theodore Parker said: "Sometimes Mr. Alcott talks like an angel."

I think he never prepared himself by writing, or made notes of what he wished to say or even to quote, although he sometimes opened the conversation by reading, but he sought to bring his mind into the right condition for fruitful meditations. He was wont to read his favorite authors, the philosophers Pythagoras, Plato, Plotinus, etc., or his quaint old poets, Quarles or Donne, Spencer or Herbert, and then as the day began to decline he took his walk around the Common, letting the bracing air and the glow of the sunset tune his mind to harmony, and fill him with inspiration.

\* Read at the Memorial Meeting of the Concord School of Philosophy, Summer of 1888.

He never cared to have any one speak to him before the meeting opened.

Yet in the strict sense of the word, Mr. Alcott was not a master of conversation, for his speech was mainly a monologue, and he was not greatly helped by contact with other minds, even by the rich company which he drew about him. He needed a listener rather than an interlocutor. He once said to me: "I wish I had some one with infinite leisure and unbounded patience to listen to my journals," and he liked the same for his speech. He wanted to hear the echo of his own thought from another mind, but he liked as well that it should be reflected back to him unchanged, as to have it remoulded by another's personality. He was little helped by opposition or criticism—it seldom struck out sparks to hammer upon him, but rather he was deafened and deadened by the concussion. He did not seek debate, but communion. He never came to a close grip with an antagonist, he always had a protecting space about him, an air cushion which neutralized the effect of the blows. Yet there was nothing overbearing in his manner, this very buoyant atmosphere made every one feel freedom as if he were floating and held by no barriers, except the impossibilities of arriving anywhere for want of assistance.

He often repeated his thought, even in precisely the same form and words, and yet it always had a certain freshness of originality, and those who really entered into his mind found him always suggestive and fresh. He said: "No book is worth reading that is not as fresh the thousandth time as the first," and his statements were so full of meaning, that after many hearings you often found yourself puzzling over them with new interest in the explanation. I was delighted to find young people of the second generation feeling the same charm in his conversation that we had done, when we sat as young girls at his feet.

Yet it was inevitable that he should sometimes find himself unable to sustain his angelic flights, and should mount a hobby which he rode over the level ground. The repetition of talk on his favorite themes of Temperament, Complexion, Diet, became wearisome to his hearers, especially to those who only perceived the outward features of the subject, and by no means recognized the wide relations which they held in Mr. Alcott's mind. There was always in the company some one to whom his treatment of these topics was new, and who, taking them in their most literal sense, combated his views with superficial arguments, so that the weariness of the discussion was due more to his opponents than to himself. The meat-eater was unwilling to be classed with beasts of prey, and the dark-haired man did not understand being called a demon, and the round of explanation had to be gone through with again and again. He was too much in earnest in

his thought to turn away from the discussion of these deep topics, which were full of deep meaning to him.

My own first recollection of Mr. Alcott is of one conversation heard in his house in Beach street, which must have been between the years 1838 and 1840. I was a mere school-girl and went with an older friend who admired and valued him. I was entirely befogged and gained nothing from the conversation but a certain personal impression of dignity and power, which inclined me to hear him again when the right time came. I remember that walking home with my father, I remarked that I could not understand his denying the miracles, which seemed to me a perfectly reasonable exercise of power by a personal God.

I did not hear him again for about ten years, when I began to attend his conversations and to make abstracts of them. In opening, he said: "We must devote the first evening principally to forming acquaintance. We must grope and blunder, and in some moment the inspiring light will come to some mind, and perhaps four or five happy episodes will be all we shall get from the conversation." In the course of these remarks Mr. Alcott said: "Words, if rigidly adhered to, become tombs of thought"; whereupon some one suggested that then "dictionaries are grave-yards!" Mr. Alcott said, he hoped we should go struggling on, we might possibly get into so deep waters of thought that we should drown therein, but he hoped not, "at any rate he had rather drown in a sea of ideas than of words."

By way of commencement he read Plato's Parable of Man, as a figure with a hundred heads of bird and beast, which represented the desires; then the figure of a Lion which was Anger; and then the figure of a Man; and he who loves justice gives the rule to this man over the beasts.

This was discussed by Miss Elizabeth Peabody, Mr. Parker, and by Mr. Scherb, a very brilliant German lecturer, then in Boston.

He then gave some phrases as: instincts, which desire; understanding, which apprehends; fancy, which images; reason, which comprehends; imagination, which seizes truths; conscience, which perceives laws, inspiration or intuition.

Mr. Parker asked him to define Understanding and Reason. He declined, saying: "God only can define, Man can only confine!" Well, will you confine them then? said Mr. Parker.

When the conversation turned to language, Mr. Alcott said: "All language is fluent, a word means what we will have it to mean at the time, it needs the whole experience of life to explain it, and no definitions can make it convey the thought to one not in a condition to receive it."

"He followed this theory and often put his own

meaning into words which made him liable to misunderstanding from others. "Taken in a certain fine sense," was a favorite expression of his used of old words which were to express new ideas.

While Theodore Parker admired Mr. Alcott and recognized his peculiar value, he was not helpful to him in the conversation on account of their very different intellectual methods. Yet Mr. Parker would sum up the whole talk of the evening in a masterly manner, showing how each person had brought out some necessary phase of the question, and presenting such a curious contrast between his definite statement, and the floating mist which had appeared before, as moved us all to laughter. He did so this evening, closing by accepting Mr. Alcott's definition of the object of man's culture "being to free him from institutions," and asking, "what methods would help to this end?"

Instead of answering this question, Mr. Alcott spoke of conversation and said: "I wish you constantly to draw me from the centre to the surface, into the region where men buy and sell. Here sits a man whose blessing or curse it is, that he dwells in the region of the Ideal, he cannot come down to the region of the Understanding, he has no common sense. Will you not take his case kindly into consideration?"

Among those present was Wm. Henry Channing, who usually helped Mr. Alcott more than any one, unless it were John W. Brown, who always comprehended and sympathized with him. But when Mr. Alcott once appealed to him to know if he used words vaguely, Mr. Brown frankly replied: "You do, and I should not understand you if I did not already know your theories." Mr. J. F. Clark was also present at the conversations.

Among the company was a German of much learning, but skeptical and excessively critical who once apologized to Mr. Alcott for having perhaps said too much and hurt the conversation. "Oh!" said Mr. Alcott, very coolly, "do not be troubled, I don't know upon the whole, but you have helped as much as you have hindered."

But the subject which never failed to puzzle his audience and to draw out much questioning and philistinism was his favorite theory of the Temperaments and Complexions and their illustration in the Angelic and Demonic Man. It was not pleasant to those who had inherited the brunette complexion and dark hair of Southern ancestors, to hear this fair, blue-eyed, light-haired man calmly class them as demons, which word they took, not in its Socratic sense, but as our own German ancestors used it.

A dark-eyed lady once said to him after such a conversation, "I believe your theory, Mr. Alcott, but I don't like to think I belong to the Demons." "Oh!

Mrs.—"I" he replied, "there are many shades darker than you, there is the Negro."

When he was thus discoursing, once, as I felt a sensitiveness for my friends, the Negroes, I said, "Swedenborg says, 'the Negroes are the most beloved of all the races in Heaven.'" "That is very kind in Mr. Swedenborg," was the answer which stopped all comment.

But the most remarkable passage of arms that I remember was with the late Col. Greene. Col. Greene was a master of the art of logic and almost rivaled Socrates in his skill in winding an adversary up into a complete snarl. Of course, he was quite antipathetic to Mr. Alcott. On one occasion, Mr. Alcott described the demonic man and it was point for point a portrait of Mr. Greene, then Reverend and not Colonel, who sat directly before him. "The demonic man is strong, he has dark hair and eyes, his eye is full of fire, he has great energy, strong will. He is logical, and loves disputation and argument. The demonic man smokes, etc." The company silently made the application, but Mr. Greene said, "But has not the demonic man his value?" "Oh, yes!" said Mr. Alcott, "the demonic man is good in his place, very good, he is good to build railroads, but I do not quite like to see him in pulpits, begging Mr. Greene's pardon."

Mr. Greene took the thrust very pleasantly but sharpened his weapons for a retort. On the first convenient occasion he had a string of questions arranged so artfully that while beginning very simply, they would inevitably lead to a *reductio ad absurdum*, if Mr. Alcott answered them frankly, according to his theory. Mr. Alcott replied with a simple affirmative or negative as Mr. Greene had planned, until the company began to perceive his intention, and that if the next question were answered as it must be, Mr. Alcott would be driven to the wall. The question was put, but instead of the simple answer, Mr. Alcott began to talk, and that most delightfully. He soared higher and higher, as if he had taken the wings of the morning, and brought us all the glories of heaven. I believe none of us could tell what he said, but we listened in rapture. Mr. Greene sat with one finger crossed upon another waiting for a pause to put in his question, but the time never came, his opponent was borne away in a cloud far out of sight.

I always queried whether this was intentional, or whether his good angel carried him away, but Louisa said, "O, he knew well enough what he was about."

These anecdotes may appear trivial, but they show Mr. Alcott's keenness of wit and sagacity, and his remarkable power of saying the most cutting things without wounding those to whom he talked.

(To be concluded.)

#### GIVE US A KING. BY WHEELBARROW.

It sounds conceded to hear a poor man boast of having lived a life of luxury, and yet I make that boast. I make it, I trust, with becoming modesty, but after all with pride. The sentiment is not original with me; I borrow it from Robert Burns, who, with much other valuable instruction, taught me "the luxury of being independent." Independent in soul, he meant, for neither of us was ever independent in body—that is, free from poverty and the threatenings of its ministers, cold, hunger, and care. To be sure, I was born rich. I came into the world with a large capital in the shape of health and vitality to my credit in the bank, and although it has been greatly wasted and impaired by many follies, I feel that there is quite a fund still subject to my order. I have worked from dawn till dark at the hardest kind of labor, with pick and shovel and wheelbarrow. I have unloaded lumber from ships; I have carried bricks and mortar in a hod, up, up, ladder after ladder, as high as the top-gallant mast of a man-of-war, and all for scanty wages, but I was proud of the health and strength that enabled me to do it; and the consciousness that I was a free citizen whose vote was equal in power to that of the millionaire, made life not only worth living, but a revelry of enjoyment. When the high-caste party challenged the low-caste party to fight it out, I stood by my order, the low-caste party, and fought it out on that line, not only all summer, but for four summers, and four winters, too. When the bullets knocked me over, as they sometimes did, I let the doctors patch me up again, and came forward for another round. At the end of the dispute it was my supreme luxury to "stand up stiddy in the ranks," as the low-caste banner went up and the high-caste banner came down, and I saw the flag of slavery furled for ever. It is now seriously proposed that I shall vote no more.

A large quantity of self-conceit was knocked out of me some time ago by my favorite paper, *The Chicago Tribune*. With surprise and consternation I saw that it had gone over to the Tory party. It insisted that I should be degraded, and deprived of the right to vote. This, not for any crime that I had ever done, but because of my caste and my poverty. In the creed of Toryism it is shameful to work for a living, and poverty is the unpardonable sin. The argument of *The Tribune* was contained in what is called a "lay sermon," preached by one of its editorial writers before the Chicago Philosophical Society. With high-class exaltation it proclaimed in big headlines that the lay sermon consisted of "plain truths told in cold English." The description was only half correct. The argument was "cold" enough, cold and bitter as the northern blast; but the "truths" of it were false, in morals, in politics, and in religion.

While I was reading this lay sermon three wonders grew up in my mind. First—That any woman could be "cold" enough to preach it. Secondly—What sort of philosophy was taught in that Society? Thirdly—What sort of philosophers belonged to it? Had they possessed one spark of true philosophy they would have hung down their heads in mortification to hear a woman plead in the name of social science for the starvation of the poor man's child. I do not like to believe that any woman ever said what I here quote from the report of that lay sermon in *The Tribune*. It is unnatural for any woman to scold at "Christian charity," or any other kind of charity, especially charity to little children:

Few recognize the influence of what we call "Christian charity" in drawing these irresponsible men to and keeping them in our cities. They gather like crows around a carrion, and industrious people say, "O we cannot let them starve." Cannot let them starve? Why not? How does their starving come to be any business of yours? Oh, but you cannot let their children starve! Why not? What right has any woman to be the mother of children whose father refuses or neglects to provide for them? The governor of this world lets innumerable creatures die of want. It is by letting some die that he teaches others to live, and we have no right to interfere with his arrangements.

The human soul shivers in the breeze of such "cold" blasphemy as that, and again I refuse to believe that a woman uttered it.

I don't know that lady editor, but in the following paragraph she fires very straight at me, as if she had taken particular notice of me when I first walked into the town:

By what rule of right does any man, entering a city with no more than his clothes, assume political equality with him who has dwelt there, and given time and labor to build and maintain that city?

Whether this lay preacher is a large woman or a small one, is uncertain, but I defy Mr. Sullivan, of Boston, to hit a man harder than that. I came into the city in just that way, with nothing but my clothes; that is, if you call the man inside the clothes nothing. "Gentlemen of the jury, do you find the prisoner guilty or not guilty?" said a rural justice of the peace at a recent trial. "Guiltier than a dog," replied the foreman. And that's the way I feel, "Guiltier than a dog." True, I earned an honest living, but with no more capital than a shovel and a wheelbarrow. I had the wickedness to vote right along, year after year, just the same as if I were President of the Board of Trade.

Speaking of city evils, the lady editor says that the remedy for them consists in the passage of "laws by which no one but the owners of property shall have a vote in the city government." She also says that in municipal elections "no issue is involved save that of levying and distributing taxes," and that "the govern-

ment of a city is purely a financial question." She also makes the common mistake of likening a city corporation to a private corporation formed for pecuniary profit, such as a railroad company, and logically falls into the advocacy of the cumulative vote. She would give Mr. Potter Palmer a thousand votes, and me none, on the following principle:

If one owning 100 shares in a railroad has 100 votes, while he who owns one share has but one vote, and he who owns no share has no vote, by what rule of ethics does a man who owns no share in a city vote as often or oftener than he who owns 100 shares?

Having demanded that voting in cities shall be the exclusive privilege of property owners, she rails with passionate eloquence against "the bald impertinence which enables any poor man to claim or exercise the power to control the property of his rich neighbor," meaning the exercise of the right to vote.

It is a pity that the philosophers of the Philosophical Society did not show to the lecturer that the rights of persons as well as the rights of things are involved in city government. The lives, health, peace, comfort, and security of all the people are included in the city administration, and these far outweigh in social and political importance mere considerations of property. The education of all the children is also a duty laid upon the city, but this very education is, no doubt, one of the wrongs against property of which the preacher complains. Toryism has always protested against the education of the poor. Let their children grow downward and travel backward rather than make education a tax upon the firm of Plutus, Croesus, Dives and Company. That poor children should learn anything at all is a "bald impertinence."

Fortunately, the Tories are not yet in power in Chicago, and our children can still go to school. My little daughter in the twelfth class has already learned more about the constituents of a city than this reformer and her philosophers appear to know. She learned it in what she calls a "piece" which she had to recite from one of the school books. She declaimed it for my instruction a few nights ago, in what I suppose to be the style of Henry Irving when at his best. It goes something like this:

"What constitutes a State?  
Not high raised battlement, or labored mound,  
Thick wall or moated gate;  
Not mansions proud with spires and turrets crowned;  
Not banks and boards of trade,  
Nor stock-yards, oleaginous and wide,  
Where pigs to pork are made,  
Where Bridgeport shanties waft perfume to pride.  
No; men, high-minded men,  
These constitute a State."

And the same rule applies to a city; the bricks and mortar, the bonds and mortgages, the piles of grain and the stocks of goods, the street cars and the wooden pavements; all these constitute but an inferior por-

tion of Chicago. The eight hundred thousand men, women and children are its greater elements, and their welfare rises higher than the materialism represented in taxation. Tested by the instincts of nature the political morality of this lay sermon snaps like a brittle thread. Over there is a tenement rookery, and close beside it a millionaire's palace, filled with "all the wealth of Ormus and of Ind." They are both on fire. The firemen care nothing for the worthless old tenement house, but direct all their efforts to save the palace and its furniture. Now let somebody tell the firemen that there is a child in the third story of the rookery, and instantly they leave the palace to its fate and rush to save the child. It is vain to assure them that the child is a vagrant's child, and that it ought to die in justice to the taxpayers. "Lay sermons" are useless now; through the fire and the smoke they go at the peril of their own lives to save the vagrant's child. As one of the heroes appears at the window with it, and carries it tenderly down the ladder, ten thousand people cheer. Thus the pulsations of the human heart break to pieces the mere mathematics of life, and nature itself proclaims that the poorest baby is of more consequence than brown stone fronts four stories high. Here all philosophies give way.

Besides all this, the workingmen not only build the city, but they pay the taxes too. Do the Tories wish to discuss that question? Before the debate is ended they will learn more of political economy than they will care to know. The man who owns that factory round the corner employs four hundred men. On Monday morning he shows them raw material worth five thousand dollars. They put their labor on it, and when Saturday night comes, it is worth thirteen thousand dollars. He pays the men five thousand dollars, keeping three thousand as his own reward for brain work, care, anxiety, interest on capital, taxes, insurance, and the risk of a falling market. Will it be pretended that in this three thousand dollars the workmen have not paid their own taxes and their employer's too? Because the men who own all the laboring muscle of the city, and all the artisan talent, are permitted to vote, the Tories exclaim like the fools of Israel, "Give us a king to rule over us."

So long as I have the ballot I am the friend of order; take it away from me and I become a revolutionist. Toryism in America is folly. The boon that *The Tribune* seeks would be its own destruction. If it could have its way and disfranchise all the workingmen, the value of the fine building on the corner of Madison and Dearborn would depreciate. Stocks would fall, and there would be such a "shrinkage in values" as this generation has not seen. The ballot

is the safety valve of American society. So long as I have equality of rights and opportunities I will never complain that my neighbor is rich while I am poor. Take away the ballot from the workingmen, and instead of a police force you would need an army to preserve your privileges and your property. So long as the ballot is impartial, property is safe from revolutionary violence. The social inequalities that now exist, we shall struggle to remove by moral forces, and the amelioration of the laws, by lifting up the poor without dragging down the rich. Deprive us of our moral weapon, the ballot, and we shall then try to equalize conditions by the sword.

#### ETERNITY.

LOUIS BELROSE, JR.

Along the waste of chaos, from its source  
Beyond the limit of the realm of mind,  
Rushes resistless in a whirling wind  
The mighty tumult of an aimless force.

Great clouds of star-dust rise along its course,  
And on a settling atom left behind  
Beings are formed, with power of thought combined  
With love and hate and pity and remorse.

They plan and toil and struggle, sell and buy,  
Make war among themselves and take to wife,  
While generations pass and multiply.

The little creatures wage their little strife  
Looking with longing on their little sky  
In expectation of eternal life.

Washington, D. C.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXI.—Continued.

One evening as the Prince was sitting silently by Ilse's side, and the gentlemen present were engaged in passing indignant judgment on the arbitrary management of the Vatican Library, Ilse proposed to him to look over a work that her husband had bought, containing good portraits of famous men of learning and artists. They went to examine it by a lamp in the next room, and the Prince looked at the portraits with languid interest. "Of many of them I only know," began Ilse, "what my husband has told me; I have not read their books, and of the beautiful things they have painted and composed, I know but little."

"That is just my case," replied the Prince, honestly, "it is only about the musicians that I know anything."

"Yet it is a pleasure to look at their portraits," continued Ilse; "one judges from them what the character and merits of these men may have been, and when one asks any person who knows more, one finds one's views sometimes confirmed and sometimes erroneous. That seems to make us like the men and be-

\* Translation copyrighted.

come intimate with them, and we seek for opportunities of making acquaintance with their works of art and learning. I long to know more about them. But when one has read about a great man, and after a time sees his picture, then his face appears like that of a dear friend."

"Do you like to read?" asked the Prince, looking up.

"I am beginning to like it," replied Ilse; "but unlearned heads do not take in serious things at once, especially when they excite earnest thoughts."

"I do not like to read," replied the Prince; "at least in the way in which it is pressed upon me. It is tedious to me, for I have never learned anything thoroughly, and I know nothing well."

He said this with bitterness. Ilse was shocked at the confession. "Your Highness will find that that will change now—you will have such excellent opportunities here."

"Yes," replied the Prince, "from morning till evening, and one thing after another. I am always glad when the lectures are over."

Ilse regarded the young Prince sympathizingly. "That is very unfortunate for your Highness. Is there nothing that you would care to know or possess? no collection of minerals or butterflies, or of rare books or engravings, like the Doctor over there has? In this way one can find enjoyment the whole year, and while collecting these valuable things one learns a great deal."

"If I wish to have anything of the kind I can have any quantity of them collected," replied the Prince; "but to what end? I have already so many things about me. If I were to express a wish to collect minerals, everybody about me would be in a state of excitement, and it would either be forbidden or I should have a whole collection brought into the house."

"That indeed is of no use," said Ilse, pityingly; "the only pleasure is in looking after each individual thing one's self; no man can know all, but everyone should have something which he understands thoroughly. If I may venture to compare my insignificant life with the important one that awaits your Highness, I should like to tell you my own experience. When my good mother was laid on her deathbed I was quite a young girl, but I wished to take her place in the household. I found, however, that I was quite at a loss what to do. I did not even know whether the people were industrious or lazy; I did not understand how to do anything, and if it was done badly I could not teach them better. One evening I sat discouraged and angry with myself, and I believe I wept. Then my good father said, 'You should not undertake so much at once, you should first learn some one thing accurately.' Then he took me into the dairy. Does your Highness know what that is?"

"Not exactly," replied the Prince.

She then explained to him the whole day's work of the dairy. "This was the result: I took it in hand myself, learned the work thoroughly, and thus was able to judge the maids. I learned everything about the cows accurately, and which was the best kind for us, and why; for every species does not thrive everywhere. I soon became ambitious of making good butter and cheese. I obtained information from those who were skilled in it, and sometimes read a book about it. Then I conferred with my father about improvements, and just when I came away we were thinking of getting a new machine instead of our large wooden churn. It is now set up; it is said to be very good, and to make good butter; but I have not seen it. Does your Highness know anything about churning?"

"No," replied the Prince.

Ilse described the process to him as far as she could, and continued: "When my father made up his books at midsummer, it was my pride that the dairy produce should every year increase in amount; but I was provoked that my father laughed at my small profits; he valued the cows for other reasons." Ilse gave a slight explanation on this point, and then continued: "From this time, your Highness, I felt quite at home in the world. Now, if I go to a factory, I find myself looking upon it as another kind of dairy, and when state revenues and government expenditure are talked of, I compare them with our house and farming accounts. But it is very silly in me to talk to your Highness about butter and cheese."

The Prince looked frankly into her eyes. "Ah kind lady," he said, "yours has been a happy life; I have never been so fortunate as to be able to enjoy quietly what I like. From morning to evening I have been in leading-strings, and passed on from one person to another. When, as a child, I went into the garden, the governess or tutor was always there, and when I ran or jumped about on the grass, I was to do it in a becoming manner; once, when I wished to turn a somersault, like other boys, it excited the utmost dismay, on account of its indecorum. Every moment it was said, 'that was not befitting a Prince,' or, 'this is not the proper time.' When I came out of my room I was stared at by strangers, and had always to take notice of them and bow to them; I was told with whom I was or was not to shake hands, and who I was or was not to accost. Every day passed thus. One was always to use empty forms of speech in three languages, and every day the uppermost thought was, whether one had conducted one's self well. Once I and my sister wished to lay out a little garden; immediately the head gardener was called to dig and plant for us, thus all our pleasure was spoilt. Then

we wished to act a little play, and had thought of a nice piece; again we were told that it was foolish trash, and that we must learn a play by heart, with French modes of speech, in which the children always exclaimed how dearly they loved papa and mamma, whilst we had no mother. In this training for mere show my childhood passed. I assure you I know nothing thoroughly, and though I remain here at study forever, I feel that it can do me no good, and I shall enter the world a very useless being."

"Ah, that is sad," exclaimed Ilse, with deep sympathy; "but I entreat of your Highness not to lose courage. It is impossible that the life here, among so many men of the highest capacity and worth, should not be beneficial to you."

The Prince shook his head.

"Think what a future lies before your Highness," continued Ilse. "Ah, you have every reason to be brave and confident. Your office is the highest on earth. We others work, and are happy if we can only preserve one human being from evil; but you will have the welfare and lives of thousands in your power. What you do for schools and learning through the selection of good or bad teachers, and your decisions as to peace or war, may ruin or make the whole country happy. When I think of this exalted vocation, I feel a deep respect for you, and I would implore you on my knees to do your utmost to make yourself a worthy prince. Therefore, the best advice for you is, that you should be willing to learn even what is wearisome to you. For the rest, have confidence in the future: you will yet have pleasure in life, and a feeling of worth and capacity."

The Prince was silent; for every allusion to his future position as Sovereign was forbidden at Court, and even less than others was the heir to the throne allowed to indulge in such a thought or cherish such a hope.

"I hear lectures enough," said the Prince, at last; "but I wish that I might have been brought up by a country gentleman, as you have been."

They returned to the gentlemen, and the Prince paid much attention to their conversation during the rest of the evening. When he went away, Ilse said to her husband: "There is one who has what would make thousands happy, yet he is unhappy, for they have bound up his honest heart in leather like an automaton. Oh, be kind to him, Felix; open your soul to him, that he may gain some of your confidence and power."

Her husband kissed her, and said, "That will be easier for you to do than for me. But he has himself suggested the right thing; three years with your father would be the best training for him and his country."

At breakfast the following morning the Chamber-

lain took the newspapers from the hand of the lackey; the Prince was sitting silently at table, playing with a tea-spoon, and watching a fly which was disrespectfully trying to make its way from the edge of the cream-jug into the princely cream. As the written instructions imposed upon the Chamberlain the duty of guarding the Prince from all dangerous reading—by that was meant all discontented newspapers and improper novels—he thought it best to give him the inoffensive "Daily Gazette," whilst he himself took up a loyal paper, in order to examine the court news and accounts of promotions and the bestowal of decorations. He had long finished his reading, but the Prince was still engaged with his shellfish and oysters. The Chamberlain observed with regret how little interest his young Highness took in the course of the world. An acquaintance of the Chamberlain had been promoted to be master of the horse, another announced his betrothal, and he did not fail to draw the attention of the Prince to this news; but the latter only smiled in his absent-minded way.

The Chamberlain then entered upon his next duty: he reflected upon the programme of the day. As it was incumbent upon him to make the Prince acquainted with the novelties in art and literature in the city, he waited impatiently till the Prince had done with the "Daily Gazette," in order to obtain information from it on these points. At last the Prince interrupted his cogitations by saying to him, "Mention is made here of a permanent exhibition of agricultural implements; what is there to see in such exhibitions?"

The Chamberlain tried to explain, and was delighted to make a proposal to visit this exhibition. The Prince expressed his assent by a slight nod, looked at his watch, and went up to his room to go through his three hours' morning course: one for the science of politics, one for mythology and æsthetics, and one for tactics and strategy; then he accompanied his attendant to the exhibition.

Even the Chamberlain was bored as he followed his young master through the great rooms, in which stood countless inexplicable machines. The agent of the manufacturers began his explanations; the Chamberlain asked such questions as would show a fitting love of knowledge; the Prince went patiently from one unintelligible object to another, and heard something of plows, scarifiers and rollers. At last, at the great threshing-machine, the expounder had to call a workman to bring a step-ladder, by ascending which they would be enabled to admire the internal mechanism. The Prince left this labor to the Chamberlain; played meanwhile with his lorgnette, and asked the agent, in the low tone in which he was wont to speak:

"Have you any butter-machines?"

"Yes," was the reply, "several different kinds."

The Prince then quietly turned his attention to the great threshing-machine, and learnt to value the beautiful arrangement by which it threw out the straw into an invisible hayloft. At last they came to the row of machines on which he had set his heart—the modern successors of the old time-honored churn. There they stood beside each other—the little hand-churn, by which, if the assertion of the guide was to be trusted, a housewife could make her butter in an incredibly short time; and the great machine, which could work sufficient to supply the needs of the largest dairy. It was described to the Prince how the cream, when poured in, was put in quick circular motion, and how, as a result of this, the butter was separated from the milk. He had already heard this much more agreeably told; but it gave him pleasure to see the advantages of the modern invention, and he became thoroughly convinced of its superiority. To the astonishment of his attendant he asked intelligent questions, and took hold of the crooked handle, endeavoring to turn it a little, but withdrew his hand with an embarrassed smile. At last he inquired about the price. The Chamberlain had rejoiced at the laudable desire of knowledge which his young master had shown, but was much humiliated when the Prince turned to him and said, in French, "What do you think? I have a mind to buy this little machine." "For the sake of turning the handle," thought the Chamberlain, with an inward shrug of the shoulders. "How is it that your Highness takes an especial interest in this?"

"It pleases me," replied the Prince, "and one ought to buy something of the man."

The pretty machine was bought, carried to the Prince's apartments, and placed in his study. Towards evening, whilst the Prince was taking his music lessons, the machine had to appear in the report which the Chamberlain prepared for the reigning Prince. The writer extolled the interest which his Prince had shown in the useful implements of German agriculture. But seldom had it been so difficult to the poor Chamberlain to perform the duty of a true courtier, whom it behooves to suppress his own personal feelings and to gloss over agreeably what is annoying; for, in truth, he felt deep humiliation at the silly trifling of his Prince. But at Court one does not thoroughly learn all the intricacies of a princely mind, however much one may study them. Even to the wisest chamberlain there remain certain inscrutable depths.

The Hereditary Prince covered the butter-machine with a silk cloth, and when he was alone, approached it carefully, turned the handle, and examined the mechanism.

Some days after, when the valet had undressed

the Prince, placed his slippers for him, and made his bow for the night, the Prince, contrary to custom, remained sitting in his chair, and stopped the departure of the servant by thus accosting him: "Krüger, you must do me a favor."

"What are your Highness's commands?"

"Obtain for me to-morrow morning early, without any one seeing you, a large jug of milk; but do not put the milk in the account."

"Does your Highness wish it boiled or not boiled?"

This was a difficult question. The Prince twirled his moustache silently and looked helplessly at Krüger.

"I hardly know," he began at last. "I should like to try churning a little."

Krüger was sharp enough to understand that this wish was connected with the new machine, and, long accustomed not to be astonished at anything in people of rank, he replied: "Then the machine must first be scalded, otherwise the butter will taste bad; and, besides, I must order the cream; so your Highness must wait patiently for a day."

"I leave everything to you," said the Prince, well pleased; "take the machine, and be careful that no one hears anything about it."

When Krüger, two days after, entered the Prince's room, early in the morning, he found his young master already dressed. Proud of his confidential position, he informed him, "The Chamberlain is still asleep, and all is ready."

The Prince hastened on tip-toes into the room. A large can of cream was poured into the machine; full of expectation, the Prince seated himself by the table and said; "I will turn it myself." He began to turn while Krüger looked on.

"But it must be done with regularity, your Highness," admonished Krüger.

The Prince could not resist opening the cover and looking in. "It will not come, Krüger," he said, despondingly.

"Cheer up, your Highness," said Krüger, "and graciously permit me to go on with the turning."

After that Krüger turned while the Prince looked on.

"It comes," cried the Prince, delighted, as he looked in.

"Yes, it's made," replied Krüger. "But now comes other work. The butter must be taken out and washed, if it please your Highness?"

"No," said the Prince, doubtfully, "that will never do. But the machine is good; bring me a spoon and some white bread, I will fish out what I can; one must learn to help one's self."

(To be continued.)

The hand of little employment has the daintier sense.—Shakespeare.

## BOOK REVIEWS.

ESQUISSE D'UNE PHILOSOPHIE DE L'ÊTRE. Par J.-E. Alaux. Paris: 1888. Félix Alcan.

M. J.-E. Alaux has written two works, *De la Métaphysique considérée comme Science*, and *Analyse Métaphysique*. These works, we are informed by the author in the preface of the above mentioned little book, are only programs which will be explained by a larger work in preparation. The *Esquisse d'une Philosophie de l'être* is not yet the promised book; it is rather an attempt at writing a *théodicée*, it is a philosophical poem. This is the merit and at the same time the defect of the book. It is as didactic as that of Spinoza's, not investigating or enquiring. We quote here a number of passages which are so selected as to serve for a summary. A translation would take away much of the zest, and as the language is simple and poetic, we fancy that our readers will prefer the original version.

Mr. J.-E. Alaux uses as his motto a passage from J. Lachelier: "Tout être est une force, et toute force est une pensée qui tend à une conscience de plus en plus parfaite d'elle-même."

On this idea the author builds the structure of his philosophy:

"L'être possible est l'être en puissance. La puissance n'est pas seulement la capacité d'être, mais la tendance à être: tout être possible tend à se réaliser, toute virtualité à se manifester, toute spontanéité à se déployer: un être n'est pas produit, mais se produit dès qu'il lui est permis de se produire. — Un être n'est réel et en acte qu'autant qu'il est manifeste, visible: visible à autrui, il est pour autrui; visible à soi, il est pour soi. En soi, il n'est que puissance; pour être réel, pour exister, il faut qu'il apparaisse. S'il n'apparaît qu'à autrui, il n'a de réalité que relative à autrui: il n'en a pas en soi, n'étant en soi que puissance; ni pour soi, ne se connaissant pas. Quand il se connaît, quand il s'apparaît ou se manifeste à lui-même, quand il prend conscience de soi, alors seulement il a une réalité vraie, absolue, alors il existe. — Il existe enfin, d'un véritable être et pour soi-même, quand il est conscient."

"L'être est un et multiple: l'être est dans les êtres, et un même être dans tous les êtres; les êtres sont dans l'être. — L'être est substance et mode. — Tous les êtres sont substantiels. Une même substance est au fond de toutes les substances; une même puissance, de toutes les puissances; une même cause, de toutes les causes."

"L'être universel, fond commun de tous les êtres, leur commune substance, leur commune puissance, leur commune et primitive énergie, se réalise d'abord ainsi, en un premier être, unique, éminent premier, et parfait. — Cet être est Dieu. — Dieu se connaît, puisqu'il est."

The last sentence contains a fallacy which leads the author to theism.

"L'infini du parfait être n'est point une extension infinie, mais un pouvoir infini d'agir, libre d'agir ou de n'agir pas. — L'être infini n'est pas acte infini, mais puissance infinie. — Ce qui ne peut être fait, Dieu ne le fait pas; et, de ce qui peut être fait, il fait ce qu'il veut faire. — Il est l'être, et il est un être. (If God is *Being*, how can he be a *being*?) — Il crée le monde, en le faisant passer du non-être à l'être, c'est-à-dire de l'être en puissance à l'être en acte. — Toute étendue réelle est finie, et le monde a toujours des limites; mais l'infini de l'étendue possible, qui est l'espace, permet toujours, au-delà de toute étendue réalisée, de nouvelles réalisations d'étendue pour de nouveaux êtres. — La Force suprême du monde, le principe intétendu de l'étendue universelle, est une monade présente à tous les êtres, qui tiennent d'elle leur être, leur chaleur, leur lumière et leur vie. Tel est le rapport de l'être immense aux êtres étendus; telle est l'indivisible ubiquité de Dieu."

"La puissance d'être n'a pas de commencement; l'existence de l'être en a un: c'est l'acte qui le pose. L'acte par lequel Dieu pose le monde est le commencement du monde. — Non de l'être

virtuel, qui n'a point de commencement, mais de l'être réel."

"La Puissance, l'Intelligence et la Vie en Dieu ne sont pas trois attributs, mais trois *hypostases*, trois *personnes*, personnages ou rôles, trois fonctions déterminées par trois natures irréductibles: la Puissance, par la nature de l'être; l'Intelligence, par la nature de l'intelligible; la Vie, par la nature du monde. — L'être est à la fois, pour l'Intelligence, le vrai; pour la sensibilité, le beau; pour la volonté, le bien. — Notre théisme diffère de celui qui a cours; mais, s'il rompt avec la tradition philosophique, il s'accommode aussi bien, mieux peut-être, à la tradition religieuse, à la croyance instinctive des peuples, à ce sentiment invincible qui fait que l'homme adore et prie, à ce fond de l'âme 'naturellement chrétienne' dont il convient que la philosophie tienne compte."

L'âme est ce qui a conscience de soi, le corps est l'autre, le contraire uni à elle pour la déterminer et l'exprimer en son être fini. — Tout être est pour soi-même esprit, et pour autrui matière; nous ne percevons rien hors de nous que matière, et les esprits mêmes, dès qu'ils entrent en communication avec nous, revêtent pour nous un aspect matériel. — L'esprit et la matière ne diffèrent que d'aspect. La monade à peine consciente, puissance de premier degré, sourde volonté d'être, est matière ou élément de matière; un jour elle sera esprit. La monade prise en soi, à part des autres sur lesquelles elle agit et qui agissent sur elle, est esprit, en puissance ou en acte; un agrégat de monades est matière. La monade enfin, consciente de soi, est esprit pour elle-même; elle est matière dans le rapport à d'autres formant ensemble et avec elle une masse perceptible à autrui."

"Hélas! hélas! l'homme pouvait pêcher, il pêcha. — Tout est bien, absolument parlant: et il n'y a point de mal, puisque tout est ce qu'il doit être. Il faut donc concevoir un mal qui soit un bien; un ordre universel dont un certain désordre fasse partie. — Tout être est divin; mais l'homme l'est excellement: l'homme est un dieu, car il est maître de son vouloir, capable d'un bien qui sera son œuvre, auteur et comme créateur de son être futur: il est libre. Nous voulons naturellement le bien, qui est l'être."

"La liberté fait le bien ou le mal, fait la perfection ou la dégradation de l'être, l'accroissement ou l'amoindrissement, et le bonheur ou le malheur à la suite. Dans le monde qui est le nôtre, la liberté a fait le péché, et le péché la souffrance."

"Il n'importe ici que le Christ soit un personnage ayant historiquement vécu, ou ne soit que l'Homme idéal. — Les Génies, les Puissants secondent la Providence, et font son œuvre. Ces esprits forment avec Dieu une société, une Cité parfaite dont il est le roi. La loi de cette Cité des esprits est l'amour. — Et telle est l'Eglise: la société des rachetés. — Les justes rachètent, les faibles sont rachetés."

THE NATIONAL REVENUES. *Albert Shaw*. Chicago: A. C. McClurg & Co.

This is a collection of papers by American economists, edited by Mr. Shaw, himself a writer on the same line of topics. The essays are preceded by an introductory chapter where, after calling attention to the causes of sectional division arising from slavery and the civil war, which have hindered the free discussion of political topics, the writer now premises that we have outgrown these differences, so that "with harmony of interests and recognized oneness of destiny" we can give ourselves to the study of questions of national concern. The contents of the book which follow deal with such topics as Protective Tariff, Taxation, Wages and the Tariff, etc. Most of the writers are well known college professors, including such names as Henry C. Adams of Michigan University, Anson D. Morse of Amherst, Francis A. Walker of the Massachusetts Institute of Technology and others of equal note. This little volume contains much useful information in convenient shape and is a desirable addition to the library of the student of political economy.

## CONTENTS OF FORMER NUMBERS OF "THE OPEN COURT."

### WHAT MIND IS.

PROF. E. D. COPE,.....In No. 40.  
THE NATURE OF MIND.

By THE EDITOR OF THE OPEN COURT. No. 40  
Professor Cope gives in clear and comprehensive outlines his view of mind; he opposes Materialism and Dualism, stating that "the situation is monistic." However, "as the amount of thought can most assuredly be measured, but the quality of thought can not," the eminent American scientist concludes that "consciousness has a field of its own where it ranges free from the bonds of energy." The directive element (will and mind) is qualitative not quantitative and controls the movements of the non-mental environment. "This statement may be called occultism," Prof. Cope adds, "and I suppose justly. But such is the fact."

### YOU SHOULD READ

## AMERICA. WHY?

Because it is the only paper in America that advocates *American rule* in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Culom, Sen. Manderson,  
Sen. Teller, Sen. Mitchell, Sen. Dawes,  
Sen. Stewart, Hon. Theodore Roosevelt,  
Seth Low, Hon. Andrew D. White,  
Ella Wheeler Wilcox, Bishop Cox,  
Hon. James Russell Lowell, Admiral Porter,  
Charles Dudley Warner, James Whitcomb Riley,  
Frank R. Stockton, Edgar Poe, W. C. Sullivan,  
J. T. Trowbridge, Edgar Saltus, Robert Grant,  
Julian Hawthorne, W. Clark Russell,  
and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy, and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

—Also—

### SEEDS AND PLANTS.

C. R. ORCUTT, Publisher,

The West American Scientist,  
SAN DIEGO, CALIFORNIA.

In opposition to Prof. Cope, the Editor explains his view of mind. The qualitative faculties are a matter of form. Form is the essential characteristic of mind, and a superior mind indicates a superior form of brain structure. Form is an abstraction from reality and has by itself no efficacy. M. Ribot, the founder of the French school of experimental psychology, is quoted in support of the fact that consciousness, by itself is not an effective factor in the motion of our limbs. "The consciousness of mental states may be indispensable for a proper direction of our will, but it does not possess motive power. Prof. Cope's view is considered inconsistent because leading to dualistic statements and to occultism."

A letter from Prof. E. D. Cope, which has reference to this discussion, is published in No. 42.

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Montism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Menism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

### RECENT CONTRIBUTIONS TO "THE OPEN COURT."

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of Idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the

idealist to deny the existence of matter. The materialist beholding the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

MORRISON I. SWIFT.

In No. 23 **Morrison I. Swift** makes a vigorous appeal to the churches that they become actively interested in what is generally known as "**The Social Problem**," and that they take the lead in Christianizing the people after the manner practiced by Jesus in Judea and by his disciples, as related in the New Testament. Mr. Swift's language is clear, eloquent, pervaded by an ideal humanitarianism, and is not only respectful to the clergy but even reverent. He thinks the opportunities of the present and the future are in the hands of the churches, and that the clergy may lead the van of social progress instead of trailing along behind the baggage wagons, as they have so long been contented to do. "In this country," he says, "where the church has the allegiance of so large a portion of the people, where it represents a large proportion of the specially organized moral forces of the land, where finally its material resources are almost unlimited and the money power of the country is its friend and supporter, it would be possible for the church to bring about the reform that is needed, with little difficulty, if it desired to do so." Here Mr. Swift is confronted with the important objection that should the church take the lead in the social revolution or even in social reformation so far as "to establish such fair distribution of the products of human industry that superabundance and luxury will not exist," the "money power of the country" would cease to be its "friend and supporter" and the clergy might cease to be a priesthood. He presents the difficulty thus: "It is said by some that the pulpit will not go much beyond those who maintain it. This is to acknowledge that the opinions of the clergy are to-day bought and paid for, just as lawyers are hired and legislators sent to uphold the ideas of their constituency." Notwithstanding this difficulty, Mr. Swift sees "a slumbering lion in the Christian ministry, which will, ere long, awaken and put forth its formidable powers for the poor and the oppressed."

Two other essays by Morrison I. Swift, are contained in Nos. 32 and 44. In the one he speaks of *The Scholar as a Reformer*, and in the other of *The Masses as Reformers*. The scholar has imbibed something of the historic spirit; he perceives, moreover, that the change in human institutions must ever be along the line of the moral and the ideal. Life can not be conceived in its full import, until the individual comprehends himself as the bearer of the rare essence and as containing, in no merely figurative way, the temporal hereafter. It is the mission of the scholar to reveal the larger and encompassing world of his soul, not of the bookish professional scholar but of him who has sought a profound comprehension of the meaning of life in its complexity and breadth. He must guide the masses, he must clear away the mystifying creeds and establish the truth that all men are born to live moral and beautiful and expanding lives in whatever sphere they may labor.

Mr. Swift considers the masses as the raw material for reform. There are rich people who think that general betterment means loss to them. But to dread reform is to misunderstand. Whatever is imperfect in society is injurious to all classes. A reform at one point reaches every point. The essayist sets great hopes on the masses—indeed, hopes too great, which may prove illusions. "Their minds," he concludes, "are more fluid and therefore they are more capable of growth into a surviving harmony with the conditions of life than those whose adaptations were formed earlier and in less enlightened times. . . . They are to become an infinitely more important factor in the life of the race than ever before." . . .

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. BINET.

Translated from the "Revue Philosophique" by dōpus.

PART II.

### THE MOTORY ORGANS AND THE ORGANS OF SENSE. (Continued.)

*The Flagellum.* The study of the third organ of locomotion, the flagellum, brings us to speak of the class of Mastigophores and more particularly of the group Flagellata. The Flagellates are Protozoa of very small size, all in all, very much smaller than the ciliated Infusoria. They have no vibratile cilia at all, but they are always equipped with one or more filamentous appendages which have the form of a long lash. This is the flagellum. This lash, like all the organs of locomotion hitherto studied, has two functions: it is at once an organ of locomotion and an organ of prehension. The flagellum is most frequently single or double (see fig. 4, representing the *Euglenadeses* with its single flagellum); sometimes a person can count a much larger number of them, four, six, eight, ten, and more. As regards the insertion, the same variations are met with. Sometimes the flagella are very numerous and seem to be planted on the same point of the surface of the body, thus forming a brush or plume. In other species we find several flagella arising in the anterior extremity of the body, directed forwards, and also posterior or caudal filaments which are turned toward the rear. This is observed in the genus *Trichomonas*; the anterior flagella serve for purposes of locomotion, perhaps also for the prehension of food; the posterior flagella, on the contrary, are solely organs of locomotion; they resemble a trailing tail and perform the functions of a rudder.

Fig. 4.  
*Euglenadeses*.  
r, c, = contractile reservoir; c, = eye; p, = disk of the paramylon; ch, = chromatophores; n, = nucleus.

In passing we may point out the great morphological resemblance between the Flagellata and the spermatozoa of animals, the antherozoa and the zoöspores of plants. The organs of propulsion in these beings are the same.

The Protozoan with its flagellum executes the most varied movements, moving first in one direction, then in another, and in different planes; sometimes the animal curves about entirely; but most frequently, when he uses it as an organ of prehension, he extends it its whole length before himself; the basilar part remains completely immovable and rigid, while the free end alone executes movements destined to drive food to the mouth, which is generally situated at the base of the flagellum. Ehrenberg gives to the flagellum the name proboscis; its peculiar mobility renders it worthy of this name. The flagellum, like the vibratile cilium, is an expansion of the protoplasm through the enveloping membrane. M. Certes has observed a Protozoan, the flagellum of which between whiles re-entered into the mass of the body, with which it mingled; it was replaced by a pseudopod which soon attenuated and took the form of a flagellum.

Bütschli has recently made a very interesting observation on this organ of locomotion. Under certain circumstances, the Peridinia (Dinoflagellates) throw off their long flagellum and enter into a state of repose; they generate them quite as easily. In the *Glenodinium cinctum*, Bütschli has seen the flagellum roll itself up first like a cork-screw, and then suddenly detach itself from the animal; having become free, it stirs about in the water for several minutes before becoming motionless. This observation enables us to refute those naturalists who believe that the vibratile cilium is an appendage of the cuticle, by bringing forward the fact that when the cilia with the portion of the cuticle in which they are inserted are separated from the cell, the cilia continue to move; we have just seen that the flagellum moves even after it is separated from the cuticle; this persistence of movement is sufficiently explained by the protoplasmic nature of the cilia and of the flagellum.

From another point of view, the observation of Bütschli gives us a curious example of the phenomena of *autotomy*, which have recently been studied by Frédéricq.

The pseudopodia, the vibratile cilia, and the flagellum, constitute the three motor organs that are most frequently found in the kingdom of the Protista. Among the Infusoria, moreover, particular differentiations of the protoplasm have been described, which

\* Translation copyrighted.

may be compared to the muscular fibres of the higher animals. The Vorticellæ are supported by contractile peduncles. These are filaments capable of rolling themselves up into the form of a cork-screw, when the animal is disturbed. Certain Infusoria can modify the form of their body by a sudden contraction: they have been called *metabolic*; such are the Stentors, the Prorodons, the Spirostomes. In contradistinction, those which do not change their form, for example the Parameciæ, have been called *ametabolic*. According to the observations of Lieberkühn, which date back to 1857, the metabolic Infusoria have their bodies divided into large granulous bands, separated by bright filaments. It has been asked which is the contractile element: is it the band, or is it the filament? Oscar Schmidt, Kölliker, Stein, and Rouget think that it is the band which is the contractile element. This opinion is based on the following fact, which M. Rouget was the first to observe: at the moment at which the animal contracts, the band presents transverse stria; this appearance is due to the fact that the bands contain in the state of rest small granules which, during the contraction of the animal, are disposed in transverse series, so as to recall the *sarcous elements* of Bowman.

Lieberkühn, Greef, and Engelmann attribute the active part to the bright fibre. Engelmann has based his opinion on the fact that he recognized in the filament the property of double refraction, which, according to him, belongs to all contractile substances, while the substance which separates the filaments shows only single refraction.

However that may be, it is one of these two elements that possesses the power of contraction, and which deserves the name of *myophane*, which Haeckel gave it. It is very remarkable that in the Stentors and the Spirostomes the fibrillous stria are in intimate connection with the basilar extremity of the vibratile cilia. In the Vorticellæ one can clearly see the fibrils converge toward the axis of the style, the contractile element of which they constitute.

We shall not leave the study of the motor organs without saying a word about the rhythmical movements which can be seen in the contractile vesicle of the Micro-organisms, vegetable as well as animal. This vesicle is a small cavity which is dug into the protoplasm, and which alternately increases and diminishes its capacity. Scientists by no means agree as to its exact function; Bütschli and Stein consider it to be a secretive apparatus. Its pulsations are very regular. Their number is constant in every species. In the *Chilodon cucullulus*, a pulsation occurs every two seconds; in the *Cryptochinum nigricans*, every three seconds; in the Vorticellæ, every eight seconds; in the *Euplotes*, every twenty-eight seconds; in the *Actinaria*

*incurvata*, every six minutes; Rossbach, whose curious experiments with the vibratile cilia and the cirri we have already cited, has made analogous experiments with the contractile vesicles. He observed especially that, under the action of alkaloids, the contractile vesicle ceased pulsating in diastole, and dilated enormously; but poisonous agents do not act all at once on the movements of the vesicle; they begin by paralyzing the larger cilia, which are under the influence of the will. The movements of the vesicle, like those of the small cilia, persist for a much longer time. M. E. Maupas has seen Parameciæ, killed by a discharge of trichocysts, become completely immobile, with their vibratile cilia inert and rigid, while the contractile vesicle continued to pulsate with the same activity; this activity continued for an hour.

We have now briefly examined the morphology of the motor organs of Micro-organisms.

It is very difficult to determine the physiological process of the movements produced by these organs. The simplest movements and the ones most easily understood, are those by which a cell suddenly and strongly irritated withdraws its prolongations and assumes a spherical form; this change of form can be explained by a quick condensation of the protoplasm, which becomes the seat of a phenomenon similar to that of a contracting muscle. The sudden modifications which are observed to take place in the form of the so-called metabolic Infusoria are in this way explained by an analogous phenomenon, so much the more evident as the Infusoria which possess this property, show in the cortical layer of their protoplasm (ectosarc) granulous bands which have with more or less justice been compared to the muscles of the higher animals. The displacements of the body determined by the pseudopodia, by the vibratile cilia, and by the flagellum are much more difficult to interpret; meanwhile it is probable that the movement proceeds from the contractions of the protoplasm which are produced either in the ectosarc or in the motor organ itself; the latter is automobile, as is seen, for example, when a flagellum separated from the rest of the body continues to move in the liquid.

It is well known that any number of discussions have been raised as to the manner in which the pedicel on which the Vorticellæ are mounted, contracts. Still more obscure is the oscillatory movement of the Bacteria. These small beings are very mobile when they find themselves in a liquid; they frequently exhibit a movement of oscillation which sometimes carries them forward, sometimes backwards. An attempt has been made to explain these movements by postulating the presence of organs of locomotion, extremely slender filaments planted at one of the extremities of the Bacteria like small rods; but the existence of these

organs has not been absolutely proved. Even more obscure is the movement observed in certain Gregarines. It would seem that in the case of these animals, which are often of considerable size, one ought to be able to understand the principle of their movements much more easily than in the case of such small beings as the Bacteria; but this is not the case. The Polycystids have a very peculiar manner of moving; the motion is one of perfect translation, uniform and rectilinear; the animal seems to slide all of a piece over the object-plate; it can go to the right, to the left, stay its motion and resume it again; it is free in directing its movements. Now, during this movement nothing can be seen to take place in the body from within or without. An analogous phenomenon is to be observed in the Diatomes. Some scientists have wished to explain the mysterious motion by translation executed by the Gregarines, as being due to an imperceptible undulation of the sarcode; but if there were any undulations whatever, one ought to observe a correlative movement in the granules inside; now this is something that is never seen.

Thus there still exists a great deal of obscurity concerning the principles determining motion among the Proto-organisms. The theories based upon muscular contraction that have been propounded from observing higher animals, are by no means sufficient to explain the phenomena of motility among certain Protozoa and Protophytes.

*Nervous System.* Hitherto not the minutest trace of a central nervous system has been found in a single Proto-organism. The nervous function among these inferior beings devolves upon the protoplasm, which is irritable, which feels and which moves, and which, in certain species, as we shall see later on, is even capable of performing certain psychic acts, the complexity of which seems quite out of proportion to the small quantity of ponderable matter which serves as a substratum to these phenomena. There is, moreover, no occasion to be surprised that an undifferentiated mass of protoplasm should be able to exercise the functions of a veritable nervous system. In fact every nervous element is nothing else than the product of protoplasmic differentiation; the protoplasm embodies in itself all the functions that, in consequence of an ulterior division of labor among the pluricellular organisms, have been assigned to distinct elements.

It has rightly been held, therefore, that if no nervous system, anatomically differentiated, existed in proto-organisms, it must be admitted that their protoplasm contains a *diffused nervous system*. Among all the observations that uphold this idea, we must cite one to which M. Gruber, a professor at Freiburg, in Breisgau, has recently called attention. This obser-

vation was made on a large, ciliated Infusory, the Stentor, of which mention will be made so often hereafter that it will be advantageous to give a full description of it beforehand.

The Stentor has an elongated body, broadened in front like a funnel, and able to fasten itself by its posterior extremity. The edge of its peristome is covered by a belt of vibratile cilia disposed about a spiral line. The mouth occupies the most sunken part of the peristome.

The body of the animal is striated with longitudinal bands; at the plane of the peristome, these bands take a different direction: they become transversal and spiral. In the interior of the protoplasm can be observed a contractile vacuole and a nucleus like a string of beads, made up of a large number of grains. This

Infusory, like all the Ciliates, multiplies by fission; a contraction, is seen to take place in the middle of the body; the segment below the contraction generates a peristome similar to that of the upper segment; then a second contractile vacuole is formed, and soon the two segments represent two complete animals which possess all their organs. Nevertheless, the two Stentors continue to be united for a certain length of time by a bridge of matter, located even with the point where the contraction took place; this bridge of matter gradually grows thinner and thinner and becomes as fine as a thread. (See fig. 5.) Now, Gruber has observed that the two Stentors united by this

Fig. 5. Stentor in process of division.

bridge of protoplasm exhibit perfect harmony in their movements; they always sway in the same direction at the same time; and this harmony is necessary, because the least contrariety of motion would suffice to break the feeble bond that unites them. Moreover, their vibratile cilia beat in unison. To explain this concordance in the movements of the two animals, Gruber assumes that the entire mass of their protoplasm performs the function of a diffused nervous system, which has the effect of regulating their movements and of making them harmonize.

We might add that the Infusoria possess not only a diffused nervous system, but that they must of necessity possess special nerve centres, endowed with different functions.

It will be remembered in fact that, under the influence of certain poisonous agents, death is not simultaneous throughout all parts of the organism. What ceases first are the voluntary movements of the large

cilia; the movements of the small cilia are able to persist much longer; and finally, when all the cilia have become immobile and rigid, the vesicle has still been seen to pulsate for an hour. This gradual death recalls what we remark among the Vertebrates; under the influence of poisonous agents, the brain dies first, then follows the marrow, and lastly the bulb, which is the *ultimum moriens*.

(To be continued.)

#### REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

BY MRS. EDNAH D. CHENEY.

PART II.

The different way in which he and Mr. Parker regarded Jesus's severe denunciations of the Scribes and Pharisees was characteristic. Mr. Alcott thought they were spoken with such divine serenity that nobody's feelings were hurt, but Mr. Parker said, "No man uttered those words without his pulse running up to a hundred and twenty, and his heart beating as if it would burst out of his bosom."

A witty lady once said Mr. Alcott was "so much of a lamb, he was a little bit of a sheep;" but he had weapons of defence, wit, sarcasm, and irony, which he could use on occasion.

A lady once saying to him, "Mr. Alcott, why have you not come to see me, as you ought to have done?" he replied, "There are many oughts, some of them quite as important as Mrs. —."

To a person who was very much troubled about the Free Love movements, saying, "I ought to do something about them. What shall I do? I wish some one would tell me what to do," he quietly replied, "Meantime, there is Providence."

It is easy to understand that it is far more possible to give such salient exceptions to the usual tenor of the conversation, than any idea of the real height and depth of his thought; you must seek for that in his writings and in the noble criticism of his philosophy we shall have from the one, I may almost say, alone able to give it to us.

While Mr. Alcott's only means of earning money at this time was from these conversations, it was very hard for him to make a pecuniary bargain for them, and he was so unskillful in money matters that one year, in making out his circular, he had put the price of single tickets so low that it was cheaper to buy them all than a ticket for the course. He was very generous in giving free tickets to those who desired them, even to those who added nothing to the pleasure of the company. I remember one woman, somewhat crazed in mind, who occasionally threw the company into convulsions of laughter by her ill-timed remarks, but whom he bore with patiently, always giving her free tickets and escorting her down to the North End after the conversation was over, because he did not think it safe for her to go alone.

With all his seeming impracticality, Mr. Alcott was not slipshod in his arrangements. He loved thoroughness, good form, good manners. He was never unpunctual either in opening or closing the conversation. He respected his audience and treated them with justice.

The greatest advantage gained from the Town and Country Club established about this time was, that it gave Mr. Alcott a large room in which to hold conversations, and as he thus had no expense for rent, he indulged himself in inviting the company to take tickets, I am not quite sure whether without pay or not. There were to be four conversations, and it was hoped that none would be present but those who felt real interest in him, and who would not be liable to misunderstand him. It hardly proved so, however, for his abounding generosity would not allow him to refuse a ticket to any one who wished it, and as Mr. Emerson's name was joined in the invitation, many wished to attend from curiosity or a very superficial interest. The room was generally crowded. Miss Bremer was once or twice among the guests, very much delighted, but not quite agreeing with his theories. Mr. Emerson came and kept his promise to speak, although with painful effort as he shrank from extemporaneous speech. Among others was a Jewish gentleman who objected to everything other people believed in and who annoyed Mr. Alcott more than I ever saw any one else do. "That raised Lazarus," was his common expression for him. Mr. Sumner was among the guests, and Dr. Elder of Philadelphia. I think it was this winter that Mr. Lowell was occasionally present, and tried to catch Mr. Alcott in some of his theories, but his good genius usually saved him.

In 1851, Mr. Alcott managed his conversations in a novel way, which brought out his rare power of appreciating and delineating character. He proposed a series of seven conversations of Representative men, most of them living and all of our own times.

He first spoke of the true American type as not having yet appeared, and introduced Daniel Webster as not a representative American, not combining all the races which are going to form the new type. He said, "Nature meant to make a noble man, she built the forehead nobly, but the backhead is too powerful even for that, and the crown is wanting. She put in four or five Romans, two or three Saxons, but not the Hebrew. On the plane of the memory and understanding he is great, he deals wisely with affairs, with coarse material interests, but not in the imagination, not in the pure reason, not in the conscience. We do not go to Webster for metaphysics. No mother would ask him how to educate her child."

Mr. Alcott drew a comparison between Webster and Cromwell and added that Webster "lacked the

feminine. He was old too early, and without the feminine we can have no true manhood."

"Not until we get the feminine element in Congress, whether in a man or a woman, shall we have the right spirit there."

He spoke of him as a conservative. "There is," he said, "a true conservatism, but in the popular sense, the conservative is a man behind himself, and behind his times. He is a demonic man." Probably, Webster was the best type of what Mr. Alcott really meant by the Demonic Man. He said also "that the characteristic of the great men of the last century, from Goethe to Webster, had been this duplicity, this divided nature. We see it in Byron, in Coleridge—eminently in Carlyle. Coleridge did not sin as Webster, but he was also guilty of that which prevented his doing the things he was capable of doing. The serene single man is yet wanting."

Mr. Garrison represented the Liberal on the second evening, and the conversation was carried on more by others than usual. Mr. Alcott spoke of the Liberator, as Mr. Garrison's diary and best exponent, and of its value as History. In my abstract I have said that I fear I have not fully presented the broad and ample justice Mr. Alcott did to Mr. Garrison. Theodore Parker was the third topic, and Mr. Alcott called him the representative of "popular rights." "He is a great Saxon, with perhaps a little of the Roman. He speaks a thing because it is so, not because he will have it so. We have said all when we have called him 'a man.' Books and libraries serve him, he serves humanity."

"If Mr. Parker is not our priest, he indicates him. He is the silence of the priest, greater than his speech. He moves us not by words alone, but by his port, manner, disposition. There is a soul alive deified in him. He is pre-eminently gifted to operate on the people's heart."

Even in re-reading my poor abstract, I am very much struck with the genial appreciation which Mr. Alcott showed of one so unlike himself. Mr. Parker did not quite suit his imagination, but his heart and conscience responded to him.

Mr. Wm. Henry Channing was the subject of the next discussion. Of him Mr. Alcott said, "He partakes more largely of the fluid element, he is liberated and freed and is an enthusiast. Mr. Channing has not a great imagination, but a lively fancy. As Mr. Parker represents Rights, he represents Love." In answer to a question as to Mr. Channing's failure, Mr. Alcott said, "That is failure when a man's idea ruins him, when he is dwarfed and killed by it, but when he is ever-growing by it, ever true to it, and does not lose it by any partial or immediate failures—that is success whatever it seems to the world." Again, he said, "True discrimina-

tion can come only from a genuine love. It is the paint for our canvass-portrait. He only can truly paint the Devil who for the time loves him!"

I am sorry to find my abstracts of the remaining evenings quite incomplete. Of Dr. Wm. Ellery Channing he spoke as among men of sentiment. My impression of the evening is that he hardly accounted for the wide mark which Dr. Channing has made, but he summed up the conversation thus:

"It is character that does the work. We have one man here who knows how to do his work, he hits the nail on the head. It is not the hammer that hits the nail, it is the man that holds it."

Of the discussion of Mr. Emerson, I have unfortunately no record, I was absent from illness, but it was reported to me as very beautiful. Neither have I any abstract of the conversation on Margaret Fuller as the representative of woman, but in a private letter written at the time, I speak of it as a painful disappointment, so that I sat in agony until I resigned the evening as hopelessly lost. It appears to have been taken out of Mr. Alcott's hands. An old-school physician made a disagreeable attack on Harriet K. Hunt and the Medical College, at which all the company were indignant and which she very properly answered:

Those who love poetical justice may be glad to know that this same physician, very high in his profession, from a bitter opponent became a kind advocate and most helpful friend to women physicians.

Mr. Alcott, however, as well as Mr. Higginson, spoke very beautifully of Margaret Fuller, as I have also recorded his doing in private conversation. I am sorry that I have not his words, for it is a popular error to suppose that these two noble souls were not in cordial harmony of feeling, although so different in expression. Mr. Alcott summed up these conversations as a series of seven pictures.

Our first, Mr. Webster, was a colossal bronze statue.

Our second, Mr. Garrison, was a phrenological head illuminated.

Our third, Mr. Parker, was a bold crayon drawing, wanting in some richness of coloring, but still a good crayon sketch—we were pretty well satisfied with it.

Our fourth, Mr. Channing, was a profile.

Our fifth, Margaret Fuller, was only an outline with the features left out and is left on the easel, it is not yet painted.

Our sixth, Mr. Emerson, was a finely cut medalion and when it was done we fell in love with it ourselves.

Our seventh, Dr. Channing, we hoped would be a miniature. It has not been quite perfect, but we guess it is a miniature.

A new course of fifteen lectures was proposed (on

what I have in a letter disrespectfully called the old fellows, by which I presume was meant the philosophers) from Hermes to Goethe.

I think this course was never given. I have no record or remembrance of it.

Beside these public courses Mr. Alcott had occasionally classes of young ladies, to whom he read from the philosophers and poets. Sometimes he required us to write, transposing a poem into prose. Wordsworth's "Intimations of Immortality" was a favorite subject for this exercise. He frequently attended the meetings of a class who were reading Plato and gave them inspiration and help in understanding his works.

I find three hours mentioned as the length of one of these lessons and no weariness is expressed.

In 1849, Mr. Emerson gave a course of lectures in Freeman Place Chapel. Mr. Alcott invited his friends to come to his room in West Street, after the lecture, to meet Mr. Emerson. They were delightful hours of free social converse, with the lecture for a subject of discussion interesting to all. One evening I noted as present, Mr. Alcott, Mr. Emerson, Mr. Lowell, Mrs. Holland, Mrs. Payne, Mr. and Mrs. Whipple, Mr. Gould, Mr. Woodman, Mr. Fernald, Miss Sarah Dana and others. Mr. Parker was usually there, and Miss Peabody.

It is difficult to show by any figures or even any definite statement of theories or principles, the result of all this work of Mr. Alcott's. For myself, I find his influence so inwoven with all my reading and my hearing at that time, so rich in intellectual life, that I cannot refer things very decidedly to his teaching, but the stimulus to thought was very great. Every subject was treated in its highest relations. No personal or party aims crept in to bias the judgment. There was no sneer for enthusiasm, no putting down of the standard in ethics to meet temporary exigencies. For the time as was said of one of the company by a wit, we were like "disembodied intelligences" seeking for pure thought. In looking over old correspondence I find many minds responding to this influence, even those who could not receive it directly, and this I believe was the way in which Mr. Alcott's thought was spread abroad in wider and wider circles until at last many were helped who never knew from whence the first impulse came.

Yet there were those who did not then and never have accepted this teacher. He had to be content with the recognition of the few who were like-minded or receptive, and leave others to study the great problem by other methods. He had his limitations, but they were not rigid bars. He was unique in his special power, and there were enough to translate the music of his thought into the language of the world.

In speaking of his teaching and his relation to children I think these same limitations must be borne in mind. I wish very much that we could have the testimony of those who were his scholars in childhood. I find a great discrepancy in their views, and am constrained to think he had the same power of impressing a few deeply while he could not influence others at all, with children as with grown people. I know of one pupil, that, in the language of her wise aunt, "he opened her mind," and they felt she was a changed being from his instructions, while others will not confess to any benefit and have kept the same indifference through life. I think he regarded the child too abstractly as an angel, and did not always see what was working in the pupil's thought or what was merely an attempt to reflect his suggestions. He could hardly escape this illusion entirely.

How lasting and wide his influence will become, I cannot venture to predict, but unique and beneficent as it was, to those near to him, I cannot think that it will be lost, but will continue to fashion the thoughts and minds of those who find they can breathe in his atmosphere as in their native air.

If the form of conversation to which he committed his thought seem slight and perishable, we must remember that words are as lasting as temples and statues, and are all that the greatest of teachers has left to us.

#### MISCELLANEOUS.

##### MATHEMATICAL DEMONSTRATION OF THE EXISTENCE OF GOD.\*

A STUDY IN LOGIC, BY BARR FERRER.

If we analyze any given effect, we will find that it has been brought about by a series of causes acting one after the other. That is, the cause immediately preceding the effect has been produced by another cause, which in turn has been produced by a third, and so on, thus:—

EFFECT	CAUSE	CAUSE	CAUSE	ETC.
--------	-------	-------	-------	------

If the analysis is continued indefinitely, we will obtain a series so long that it is impossible not only to number it, but even to conceive of any number sufficiently great to express the relation between the effect and the most distantly removed cause that we can discover. But as this is an unending series we cannot say that more than two terms are separated by this unassignable quantity. For, if we did, we should at once give a value to one of them, which, even though it could not be expressed in numbers, and be only comparative, would be contrary to the meaning of "unassignable." This can be readily illustrated thus: Suppose our series to be represented by a straight line

A—————B—————C

and let A be the effect whose causes we are examining. Now, if B be a cause removed from A by a number of terms greater than any assignable quantity, it is obvious that there can be no difference between AB and AC, because if there were, then AC would

be greater than AB, which is impossible, since AB itself is greater than any assignable quantity, and there can, therefore, be nothing greater.

Now this term, which we may call B, cannot be located in space or in thought, for if it could we would at once limit it, which is incompatible with the terms that express it; viz., greater than any assignable quantity. From this it may be argued that there is no such term, and that as we cannot even think of it there is no use of speculating on it. But this is no reason at all. There was a time when the fact that the earth is "round like an orange" was deemed both unthinkable and impossible. Yet now every one believes it, and although we ourselves may not be able to comprehend such a series as has been projected, we have no right to assume that it is an absurdity. And further, if we transpose our series into mathematical terms, and find an expression for this cause B, evolved by the law of the series, we are perfectly justified in comparing its mathematical representative with the representative of A, and thus determining what relation, if any, exists between the two terms. And now we have first to discover the law of the series, and then consider only the first term, and that removed from it by an unassignable quantity.

1) These causes viewed from the position of our original effect are each equally important in its production; in other words, the given effect can only be produced by the action of *all* of them; they are, therefore, each equal in value to each other, and if one of them is omitted, a different effect will ensue. This can be shown algebraically. If the series of causes of an effect be represented by the equation

$$v + w + x + y = A$$

then, if one cause is omitted, since we must take the same thing from each member, we obtain

$$v + w + x + y = A - z$$

which is obviously a very different effect from the first one.

But not only are all the causes necessary to bring about the result A, but no one is of greater importance than the other. For, if it were, let us suppose by the quantity  $a$ , we should have, by the simplest rule of algebra, not

$$v + w + x + y + z = A$$

but

$$a + v + w + x + y + z = A + a$$

which is also a different effect from A.

2) Cause is only knowable through effect. Effect is cause manifested. Hence, in order that it be manifest, it is evident that the effect must be contained within it, or otherwise it cannot appear. A parallel case is any number, say 5, which we may say contains 1 and 4, or,

$$5 = 4 + 1$$

or, algebraically,

$$x = y.$$

These, then, are the two characteristics of our series, and we need a mathematical expression for a series whose number of terms is greater than any assignable quantity, and in which (1) each term is equal to each other, and (2) each term, beginning with the first, is included in the term next following.

A multitude of series is at once suggested. The only ones possible are those of powers of a number, and of these only one fulfills the required conditions. It is obvious that the series cannot be

$$a, a^2, a^3, a^4, \dots, a^\infty$$

for unless  $a=1$ , each succeeding term has a greater value than that which precedes it. Neither can it be

$$a, a, a, a, a, \dots, a$$

or

$$a, a^0, a^0, a^0, a^0, \dots, a^0$$

for each term does not contain the preceding. So also the series

cannot be

$$1, 1^{\frac{1}{2}}, 1^{\frac{1}{3}}, 1^{\frac{1}{4}}, \dots, 1^{\frac{1}{\infty}}$$

since Moivre's Theorem, a well-known problem in the Calculus, shows that the roots of unity are not identical:—

$$(\cos x + \sqrt{-1} \sin x)^{\frac{1}{n}} = \cos \frac{x}{n} + \sqrt{-1} \sin \frac{x}{n}$$

Let  $x = m\pi$ , then

$$\left(\pm 1\right)^{\frac{1}{n}} = \cos \frac{m\pi}{n} + \sqrt{-1} \sin \frac{m\pi}{n}$$

substituting the proper value for  $n$  we obtain

$$(1)^{\frac{1}{2}} = \pm 1$$

$$(1)^{\frac{1}{2}} = 1, \frac{1}{2}(-1 \pm \sqrt{-3})$$

$$(1)^{\frac{1}{4}} = \pm 1 \pm \sqrt{-1}$$

and so on.

There is only one other series possible; viz., the series of the integral powers of unity:—

$$1, 1^2, 1^3, 1^4, 1^5, \dots, 1^\infty$$

in which, as in all cases,  $\infty$  is the mathematical symbol for a value greater than any assignable value.

This series fulfills the required conditions perfectly, for each term is equal to each other term,

$$1 = 1^2 = 1^3 = 1^4 = 1^5 = 1^6 = 1^7$$

and, further, each term is included in the preceding one. That is, the effect 1 is included in its cause  $1^2$ , which is included in its cause  $1^3$ , which is itself included in its own cause  $1^4$ , and so on indefinitely.

Now a careful examination of this series itself, without any more mathematics, shows that the Ultimate (= First) Cause is totally different from all other causes.  $1^\infty$  includes all possible powers of unity; i. e., includes all the preceding terms of the series, or all possible causes. And as it includes all causes within itself, it is obviously able of itself to produce all phenomena.

But it can be shown in a much more rigid manner that the First Cause is absolutely different from all other causes. This can be done by the easy problem of evaluating the function

$$\left(1 + \frac{1}{x}\right)^x \text{ when } x = \infty, \text{ for } \left(1 + \frac{1}{x}\right)^x \Big|_{\infty} = 1^\infty$$

Let  $x = \frac{1}{z}$  and denote the function by  $v$ ,

Then  $v = \left(1 + z\right)^{\frac{1}{z}}$ , since when  $x = \infty, z = 0$   
and  $\log v = \log \left(1 + z\right)^{\frac{1}{z}}$  when  $z = 0$

Taking derivatives

$$\log v \Big|_0 = \frac{1}{1+z} \Big|_0 = 1$$

$$\therefore \log \left(1 + \frac{1}{x}\right)^x = 1 \text{ when } x = \infty$$

$$\text{hence } \left(1 + \frac{1}{x}\right)^x = e \text{ when } x = \infty$$

That is,  $1^\infty = e = 2.718281828$ , the base of the Napierian system of Logarithms.

We see at once that we have something of which we have no knowledge, and something very different from what has gone before. Our known causes are all 1; the Ultimate Cause is 2.718281828; they are absolutely, infinitely different. Thus mathematical analysis shows that in the beginning there is a Cause, physically Unknowable, Self-Existent, Omnipotent,—GOD.

There is another conclusion that may be drawn from this reasoning. Force being physical cause, we have a perfect right to substitute the word force for cause in the above analysis. Doing

so, we see that the theory of the conservation of energy is not true; for after any force has undergone changes whose number is unassignable or indefinite, it is increased in strength (or value) in the ratio of 1 to 2.718281828.

This latter proposition explains the theory of evolution, and may, perhaps, point the way for its logical demonstration. The lowest forms of life exhibit little vitality or force, the next higher a little more, and so on, increasing more and more. It has long been a matter of speculation whence came this increase. But the reasoning here explains it, for since force increases with infinite change, an infinite number of changes must have taken place before a new form of life was evolved. At the same time it embraces the comforting assurance that the human intellect, increasing with infinite changes, will comprehend yet broader fields of thought than are now open to its vision.

PHILADELPHIA, 1888.

#### THE FUNCTION OF ZERO IN MATHEMATICS.

The mathematical study, published above and offered by Mr. Barr Ferree "as a curiosity in Logic," is like many serious ontological proofs for the existence of God; it is a trick of *legerdemain* in reasoning. Mr. Ferree undertakes to prove that in the infinite series of effects and causes the ultimate term differs from the other terms. The first cause,  $1^\infty$ , it is maintained, is totally different from all other causes. This is apparently incorrect, for  $1^\infty$  (i. e., one taken infinite times) is one just as much as one taken once, or one taken to any imaginable power. We have no objection to comparing the concatenation of causes and effects to an infinite series of

$$1, 1^2, 1^3, 1^4, \dots, 1^\infty$$

so as to indicate that in all causal changes the sum total of potential and kinetic energy always remains the same, just as much as

$$1^\infty = 1 = 1^x = 1^3 \text{ etc.}$$

As regards the calculation of the function

$$\left(1 + \frac{1}{x}\right)^x \text{ where } x = \infty$$

we must object to the very first assumption which makes the function  $= 1^\infty$ .  $\frac{1}{\infty}$  is infinitely small. But we must be careful when using functions of 0 and  $\infty$ , always to take into consideration how they originated. In most cases  $\frac{1}{\infty}$  is equivalent to zero; yet it can not under all circumstances take its place. The present example is an instance, as will be seen on expanding the function  $\left(1 + \frac{1}{\infty}\right)^\infty$ . The value of the function  $(1 + 0)^\infty$  will be seen not to be  $= 1^\infty$ , as Mr. Ferree assumes.

The evaluation, being wrong at the start, naturally ends with a contradictory statement

$$1^\infty = e = 2.718281828,$$

We know that  $1^\infty = 1$  and can never be the base of the Napierian system of logarithms. It goes without saying that the substitution of the word "force" for "cause" in the above analysis is likewise not allowable.

Aside from these errors, Mr. Ferree's mathematical demonstration of what he calls God, viz. a demonstration of something absolutely different from other things, of a term in an infinite series that is essentially different from the other terms, of a cause that is not like other causes, of a number that is no number, and yet wondrously affects all numbers—this demonstration is fundamentally based on the idea of nothingness. Nothing is absolutely different from something. This is a logical statement which is undeniable, and translated into mathematical language, it means "zero (or nought) is a number which is essentially different from all the other numbers."

The functions of zero become indefinite and are therefore un-

reliable in calculations. As a consequence of Mr. Ferree's line of reasoning, God would be not only the infinite but as such also the indefinite; and the latter in mathematics is a function that cannot be trusted, because it leads into errors and wrong statements.

With the assistance of Nothingness in logic and of Zero in mathematics we can perform all kinds of mental somersaults, we can work miracles and make anything out of everything. You wish to prove for the benefit of the trinitarian doctrine that  $3 = 1$ . You can do it with the assistance of 0. Multiply the equation with  $0 = 0$  and you have  $3 \cdot 0 = 1 \cdot 0$ . Which is a correct equation for both its members are  $= 0$ . Or, you wish to prove that horses have three tails. This is demonstrable by stating that

No horse has two tails and

One horse has one tail more than no horse

*Ergo* one horse has three tails.

Here, it is at once obvious, the negative term "no horse" is used in two different meanings.

These mental somersaults grow more complicated if, in the place of zero, functions of zero are employed. Infinity for instance is "One divided by zero."

$$\infty = \frac{1}{0}$$

If infinity is no more thought of as a function of zero, but treated as any other number, it can be used as a conjuror's wand which will square the circle and afford mathematical proofs for any impossibility.

EDITOR.

#### BOOK REVIEWS.

The Truth Seeker Company, of 28 Lafayette Place, New York City, have just issued a short sketch of the French Revolution by W. S. Bell, entitled *An Outline of the French Revolution: Its Causes and Results*. The publication is in pamphlet form, and affords a brief but comprehensive view of the period it treats.

ADELAIDE RISTORI, *Famous Women Series*. Boston: Roberts Bros.

This is a charming autobiography, written with great candor and simplicity, and forms a unique addition to a series of works that has won deserved praise. Mme. Ristori gives us a complete story of her life from the time of her first appearance on the stage at the age of three months. The chapters relating her first trip abroad and visit to France where she was brought into direct competition with the artist Rachel are remarkably well told and full of interest.

C. P. W.

NEGRO MYTHS FROM THE GEORGIA COAST. Told in the Vernacular. By Charles C. Jones, Jr., LL. D. Boston and New York: 1888. Houghton, Mifflin & Company.

This little work, with its odd conceits and homely wisdom, its sententious notes and quaint thoughts, cannot fail to interest a multitude of readers. The merit and significance of this collection of Negro Myths has been fully discussed and analyzed by Mr. L. J. Vance, in Nos. 42, 44, and 46 of THE OPEN COURT, to which we refer our readers. The Negro Dialect gives the book its distinctive charm; it is easily mastered, however, and its humor becomes at once enjoyable.

The *Art Amateur* for August is a little ahead of its season, with its colored print of golden rod and Autumn leaves, which remind us that the short vacation time is rapidly passing away, and that the bracing airs of Autumn will soon call us to the front to take part in the busy work or active fight of the world. The summer has been ill spent which does not leave us the fresher and stronger for our tasks, be they what they will. There is no dog-day languor about "My Note Book" which is full as ever of lively gossip about artists and traders in art. It is humiliating to hear that Artists have their tricks of the trade, in duplicating and forging their own pictures to increase the sale, but picture-makers

are but men, and where they work only for money, why should they be more scrupulous than others about the means of obtaining it? We are proud of those who have shown themselves to be artists in soul as well as by profession, by protesting against that narrow policy mis-called protection, which would place a tax on the true means of generous emulation and efforts for improvement. How long must the enlightened States of America be classed with Hawaii and Corea and Honduras and New Zealand who tax foreign pictures by the pound or the penny worth. Art can be expected to be nothing but manufacture or merchandise where it is so held by the rulers of the people. The *Atelier* is specially rich this month both in its essay on Landscape Painting, well illustrated, and in its directions for decorative work. One article on Dogs is accompanied by many vivid sketches of these intelligent and very individual animals, while another called "A Talk with Mr. James Beard on the Painting of Dogs," is more than technical and shows the young student how he must observe them in order to catch their expression and action. In response to questions in regard to the Photo-Engraving processes, the editor says "An article or a series of articles, practical and well written, on these subjects would be accepted by the *Art Amateur* and paid for." Surely there must be those competent to write such articles which would be very welcome to readers. The value and applications of these processes are important practical questions to many who need to reproduce photographs on other works of art. E. D. C.

In the sonnets of Mr. Belrose published in *THE OPEN COURT* of May 17, and August 2, of the present volume, a mistake was made by the printers in the arrangement of the lines. The position should have been according to the rhyme, which was not between alternate lines, as the form in which the sonnets were printed indicated.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXI.—Continued.

The Prince plunged his spoon into the mess, took out some of the half-made butter, and spread it on his white bread with a feeling of satisfaction that was quite new to him. "It tastes a little sour, Krüger," he said.

"Of course," replied Krüger; "the butter-milk is still in it."

"It does not matter," said the Prince, consoling himself. "Krüger, I did not think there was so much to be attended to in churning."

"Yes, all things are difficult in the beginning," replied Krüger, cheerfully.

"It is all right," concluded the Prince, graciously; "take the machine out, and clean it properly."

After that the churn stood peacefully under the silk cloth; the Prince in his lonely hours, would sometimes stand before it, and revolve in his mind how he could deliver it into the hands of the person for whom he had secretly intended it.

The stars themselves appeared to favor him; for the revolving earth had rolled into the last sign of the zodiac, which guides the souls of our people with

magic power to the most charming festival of the year. Christmas was near, and the ladies of the street near the Park moved about in secret activity. Intercourse with intimate acquaintances was interrupted, books that had been begun were laid aside, theatres and concert-rooms were empty; the tones of the piano-forte and of new bravuras rarely sounded to the rattling of carriage-wheels in the street; inward struggles were hushed, and bad neighbors little thought of. From morning to evening, little fingers were occupied with beads, wools, silk, paint-brush and palette; the day lengthened into eight-and-forty hours; even during the minutes of unquiet morning slumber, obliging crickets and other invisible spirits worked in the pay of the ladies. The nearer the festival approached, the more numerous were the secrets: in every closet were concealed things which no one was to see; from all sides, packages were brought into the house, that were forbidden to be touched. But whilst the other inmates of the house secretly slipped past one another, the lady of the house was the quiet ruler in the invisible realm of presents, and the confidant and clever adviser of all. She was never weary; she thought and arranged for every one; the world had become to her like a great cupboard with numerous compartments, from which she was incessantly fetching things, and in which she was always cautiously stowing covered packages. When on Christmas Eve the spangled stars shine, the wax-lights drip, and the golden balls glimmer and glisten on the Christmas tree, it is then that the fancies of the children celebrate their great day; but the poetic vision of the housewife and her daughters, for months before, have filled the room with joyful splendor.

If one may regard the judgment of Mr. Hummel as valid, it is rarely that the enthusiasm of Christmas week is fully developed in the men who have the honor of being the representatives of the family. "Believe me, Gabriel," said Mr. Hummel, one December evening, as he was watching some children who were passing by with toys, "at this time man loses his importance; he is nothing but a money-chest, in which the key is turning from morning till evening; the best wives become barefaced and foolish, all family confidence vanishes, everybody avoids everybody else, the order of the house is disturbed, one's night's rest is unscrupulously destroyed; when it is meal time, one's wife runs to the market, and when the lamps ought to be extinguished, one's daughter begins a new piece of embroidery. When at last the long bother is over, then one must be delighted at a pair of new slippers which are an inch too short, and for which later on one has to pay a long shoemaker's bill, and to be pleased with a cigar case of beads, which is flat and hard, like a dried flounder. Finally, after one has

\* Translation copyrighted.

shot out golden sparks like a rocket, the ladies expect one to show one's good feeling by making them a present. Now, I have trained mine differently."

"But I have seen you yourself," rejoined Gabriel, "with a package and bandbox under your arm."

"That is true," replied Mr. Hummel, "a bandbox is inevitable. But, Gabriel, I have given up all worry; for that was the most humiliating part of the affair. I go every year to the same milliner now, and say, 'a hood for Madame Hummel;' and the person says, 'You shall be served, Mr. Hummel;' and she places the structure ready made before me. Besides this, I go every year to the same shop and say, 'I want a dress for my daughter Laura, at such and such a price, more or less,' and a dress well worth its value is placed before me. In confidence, I must tell you I have a suspicion that the women have seen through my trick, and select the things themselves beforehand, for now they are always very much to their taste, whilst in former years they were often objected to. They have the trouble now of selecting the finery, and in the evening they practice all sorts of dissembling artifices, unfold and examine the goods, pretend to be astonished, and praise my excellent taste. This is my only satisfaction in the whole childish amusement. But it is a poor one, Gabriel."

Such was the discordant strain in which the master of the house indulged; but the dwellers in Park Street cared little for it, and like opinions will always be regarded with like indifference. So much sweeter is it to care for others than for one's self, and so much happier to give pleasure than to receive it.

For Ilse also the festival this year was to be a great event; she collected like a bee, and not only for the dear ones at home; in the city also she had nestled many great and little children in her heart, from the five young Raschke's down to the little barefooted creatures with the soup-pot. The sofa-corners assumed a mysterious appearance whenever her husband, or Laura, or the Doctor entered unexpectedly.

When the Chamberlain, some time before the holidays, deemed it becoming for his Prince to pay a visit to the new Rector, the gentlemen found Ilse and Laura busily at work, and the parlor of the Rector's wife was changed into a great market stall. On a long table stood little Christmas trees, and full sacks were leaning against the legs of the table; the ladies were working with yard-measures and scissors, dividing great hanks of wool, and unrolling pieces of linen, like shop keepers. When Ilse met the gentlemen and made excuses for the state of her room, the Chamberlain entreated her not to disturb herself. "We will remain here only if we are allowed to make ourselves useful." The Prince also said, "I beg permission to help, if you have anything for me to do."

"That is very kind," replied Ilse, "there is still much to be done before evening. Permit me, your Highness, to give you your work. Pray take the bag of nuts; and you, my Lord Chamberlain, have the goodness to take the apples in charge; you, Felix, will have the gingerbread. I beg the gentlemen to make little heaps, to each twenty nuts, six apples, and a package of gingerbread."

The gentlemen went zealously to work. The Prince counted the nuts conscientiously, and was provoked that they would always roll together again, but discovered that he could keep the portions apart by means of strips of paper folded together. The gentlemen laughed, and related how once, in a foreign country, they had introduced this German Christmas amusement. The perfume of the apples and of the fir-trees filled the room, and gave a festive feeling to the souls of all present.

"May we ask the kind lady who are to benefit by our exertions?" said the Chamberlain; "I hold here an uncommonly large apple, which I hope may fall to the lot of one of your favorites. At all events, we are doing what will give the poor children pleasure."

"Finally it will," replied Ilse; "but that is not all; we shall give this to their mothers, for the greatest pleasure of a mother is to give presents herself to her children, to adorn the Christmas tree and to work what the little ones need. This pleasure we shall not deprive them of, and therefore we send them the stuff unmade. The Christmas trees, too, they prefer buying themselves, each according to their tastes; those you see here are only for children who have no mothers. These trees will be adorned by us. Everything for the festive evening will be carried out of the house to-day, so that the people may receive them in good time, and arrange them for themselves."

The Prince looked at the Chamberlain. "Will you allow us," he began, hesitatingly, "to contribute something towards these presents?"

"Very willingly," replied Ilse, joyfully. "If your Highness wishes it, our servant can look after it immediately. He understands it, and is trustworthy."

"I should like to go with him myself," said the Prince. The Chamberlain listened with astonishment to this idea of his young master; but, as it was laudable and not against instructions, he only smiled respectfully. Gabriel was called. The Prince, much pleased, took his hat. "What shall we buy?" he asked eagerly.

"We want some little tapers," replied Ilse, "besides some playthings;—for the boys, leaden soldiers; and for the girls, little kitchen things; but all must be strong and cheap." Gabriel followed the Prince out of the house with a large basket.

"You heard what the lady ordered," said the Prince, in the street, to Gabriel. "First the waxes; you do the selecting and I will pay. We are to buy them cheap; see that we are not cheated."

"We need not fear that, your Highness," replied Gabriel; "and if we should pay a few pennies too much, other children will benefit by it."

At the end of an hour the Prince returned. Gabriel had a heavily-laden basket, while the Prince also carried under his arms bundles of toys and large paper bags full of sweetmeats. When the young gentleman entered thus loaded, with color in his cheeks and as happy as a child, he looked so good and pleasing that all were delighted with him. He unpacked his treasures before the Professor's wife, and emptied the contents of the paper bags on the table.

His embarrassment had disappeared: he played with childish pleasure with the pretty things, showed the others the artistic work in the marchpane plums, begged of Laura to keep a candy knight-templar for herself, and moved about and arranged everything so gracefully and actively on the table that all looked at him with admiration and joined in his childish jokes. When the ladies began to adorn the Christmas trees, the Prince declared he would help them. He placed himself before the saucer with white of egg, and was shown the way to lay it upon the fruits and then roll them in gold and silver foil. Ilse arranged as a prize for the gentleman who worked best and did most, a large gingerbread lady with a hooped petticoat and glass eyes; and a praiseworthy contest arose among the gentlemen to produce the best things. The Professor and the Chamberlain knew how to employ their old skill; but the Prince as a novice worked somewhat carelessly—there remained some bare spots, and in others the gold foil bulged out. He was discontented with himself, but Ilse cheered him, saying, "But your Highness must be more sparing with the gold, otherwise we shall not have enough." Finally, the Chamberlain obtained the lady in the hooped dress, and the Prince, as an extra reward for his activity, a babe in swaddling-clothes which looked on the world with two glassy bead eyes.

Out of doors in the Christmas market, little children were standing round the fir-trees and Christmas shops, looking hopefully and longingly at the treasures there. And in Ilse's room the great children were sitting at the table, playful and happy. Here there were no cautious admonitions, and the Prince painted the outlines of a face with the white of egg on the palm of his hand, and gilded it with a gold-foil.

When the Hereditary Prince rose to go, the Professor asked, "May I venture to inquire where your Highness intends to pass Christmas Eve?"

"We remain here," answered the Prince.

"As some remarkable musical performances are in prospect," added the Chamberlain, "his princely Highness has denied himself the pleasure of having the Prince with him at this festival; we are, therefore, to pass a quiet Christmas here."

"We do not venture to invite you," continued the Professor; "but in case your Highness should not pass this evening in other society, it will be a great pleasure if you would do so with us."

Ilse looked thankfully at her husband, and the Prince this time did not leave it to the Chamberlain to answer, but eagerly accepted the invitation. As he walked with his attendant through the crowded streets, he began, cautiously, "But we must contribute something to the Christmas table."

"I had just thought of that," replied the Chamberlain; "but if your Highness honors those worthy people with your company that evening, I am not sure how your Highness's father will approve of a contribution to the Christmas tree from my gracious Prince."

"I do not wish it to be any of those eternal brooches and ear-rings from the court jeweler's cases," cried the Prince, with unwonted energy; "it should be some trifle; best of all, something as a joke."

"That is my view," assented the Chamberlain; "but it is advisable to leave the decision to his Grace, your father."

"Then I had rather remain at home," replied the Prince, bitterly. "I will not enter with some stupid present in my hand. Can it not be managed that the visit be without any ceremony, just as the invitation was?"

The Chamberlain shrugged his shoulders. "A few days afterwards the whole city will know that your Highness has shown Professor Werner this unusual honor. Without doubt the occurrence will be reported to the palace by persons who have no business to do so. Your Highness knows better than I do how your father will receive such an account, coming to him first from a stranger."

The Prince's pleasure was spoilt. "Write, then, to my father," he cried, angrily; "but represent the invitation just as it was given, and express yourself as opposed to any conventional present from the court: it would only wound this family."

The Chamberlain rejoiced in the tact of his young master, and promised to write the letter as he desired. This appeased the Prince, and after a time he began: "It has just occurred to me, Weidegg, what we should give. As the Professor's wife comes from the country, I will present her with the machine which I lately bought, as a case for pretty *bonbons* or something of that kind, that I will put in it."

"Now he wishes to get rid of the useless play-

thing," thought the Chamberlain. "That is impossible," he replied, aloud: "Your Highness is not quite sure whether the lady would take the joke as it is intended. It would not do to give a present which might give rise to misinterpretation. Your Highness should on no account venture upon such a thing. Even if the amiable lady herself did not object, it would be much discussed in her circle. Your Highness's joke might be easily considered as an ironical allusion to country manners, which undoubtedly become the lady well, but might here and there occasion a slight smile."

The Prince's heart froze within him; he was furious with the Chamberlain, and, on the other hand, shocked at the thought of wounding Ilse. The poetry of the festival was entirely spoilt for him. He went silently to his apartment.

The answer to the Chamberlain's letter was to the effect that the Prince, in spite of the apparent unsuitability, would not object to an incidental visit, and that, if some mark of attention was unavoidable, it might be procured from a gardener or confectioner. The Chamberlain, therefore, bought a quantity of flowers and sweetmeats, and laid them before the Prince. But he looked cold and silently on the gay bright colors. Towards evening two lackeys carried the things to the Rector with a little note from the Chamberlain, in which, in the name of his Most Serene Prince, he begged the accompanying gift might be applied to the ornamenting of the Christmas tree. Meanwhile the Prince stood gloomily before his butter-machine, and quarrelled bitterly with his princely dignity.

When at the proper hour he entered Werner's apartment, the Christmas gifts had been distributed and the candles extinguished. Ilse had done it purposely. "It is not necessary to let these strangers see what delight we take in these presents." The Prince received Ilse's thanks for the splendid adornment of her table with reserve, and sat before the tea-kettle silent and absent-minded. Ilse thought, "He is sorry that he has had no glad Christmas Eve: the poorest child is merry with his Christmas tree, and he sits as if shut out from the pleasures of this happy time." She made a sign to Laura, and said to the Prince: "Would your Highness like to see our Christmas tree? The lights had to be extinguished lest they should burn down, but if your Highness likes we will light it up again in all its splendor, and it would be very kind of your Highness to help us."

This was a welcome proposal to the Prince, and he went with the ladies into the festive room. There he offered to take the staff, at the end of which a wax-taper was fastened, in order to reach the highest lights of the mighty tree. Whilst he was thus busily working at the tree his heart became lighter, and he

looked with interest at the presents which were lying under the tree.

"Now will your Highness have the kindness to go out of the room," said Ilse, "and when I ring it will signify to you and Mr. von Weidegg that your Highness is wanted."

The Prince hastened out; the bell rang. When the gentlemen entered they found two small tables laid out; on them small lighted trees, and under each a large dish of pastry, made after the fashion of their own country. "This is to be a remembrance of our home," said Ilse, "and on the trees are the apples and nuts which you have gilded: those with the red spots are your Highness's work. Here is a respectful gift sent from the farm of my dear father. I beg the gentlemen to eat this smoked goose's breast with a good appetite; we are not a little proud of this dish. But here, my gracious Prince, there is, as a keepsake from me, a small model of our churn; for this is at what I served my apprenticeship as a child." On the Prince's seat stood this useful instrument, made of march-pane. "On the bottom of it, your Highness, I have written my motto of long ago. May the gentlemen accept my good intentions!"

She said this so joyously, and offered her hand to the Chamberlain so kindly, that all thoughts of his dignity were forgotten, and he shook her hand right honestly. The Prince stood before his machine, and thought: "Now is the moment, or never." He read below the simple words, "If a person has devoted himself with honest perseverance to some one thing, it will be a blessing to him throughout his whole life." Then, without any thought of the threatening consequences of his daring, he said: "May I propose an exchange to you? I have bought a small churn; it has a large wheel and a small one for turning, and one can churn as much as one wants each morning. It would be a great pleasure to me if you would accept this."

Ilse thanked him with a bow; and the Prince requested that a servant might at once be sent to his apartment for it. Whilst the Chamberlain was still reflecting with amazement on the strange coincidence, the piece of mechanism was brought into the room. The Prince placed it with his own hands upon a corner of the table, explained the internal arrangements to the company, and was much delighted when Ilse said she had confidence in the invention. He was again the joyous child of the other day, gaily drank his glass of wine, and, with charming grace, proposed the health of the master and mistress of the house, so that the Chamberlain scarcely knew his Telemachus again. On taking leave, he himself packed up the marchpane and carried it home in his pocket.

(To be continued.)

WILLIAM J. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spiral world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishness means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychical connection of the whole has been attained in a much higher degree.

MONCURE D. CONWAY, on Agnosticism, in No. 47.

Mr. Moncure D. Conway, in reference to the philosophical exposure of Agnosticism in the editorial article of Nos. 43 and 44 of THE OPEN COURT, declares that the Unknowable cannot in the least concern the religious nature. Only weariness of wing can have brought free thinkers to seek rest on this raft. Religion does not follow abstract and vague gods, it follows Jesus, Buddha, Mary, who may be known and loved. On the truth and moral value of these great figures, man can base his life. Mr. Conway concludes with the remark that the ethical side of monism has not as yet been made clear. Nature seems predatory and cruelly impartial between good and evil. Adherents of error survive more comfortably and increase more extensively than the disciples of truth. May it not be more truly said that there is a moral law in man to which nature must conform in order to be elevated and transfigured to a nobler existence? Mr. Conway's critical remark if it were unanswerable from the standpoint of Monism would drive religion and philosophy back into the dualism and supernaturalism of former times. And truly the supernatural, if it is justifiable at all, must be recognized in the moral nature of man, unless man is proven to be a part of nature. The editor's answer to Mr. Conway's criticism, in the same number, expatiates on the Oneness of Man and Nature, thus showing that humanity, culture and civilization are but a higher stage of the natural, and that morality does not stand in contradiction to, but is an observance of and a conforming to the cosmical order of the All.

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. Katzenjammer is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to Katzenjammer. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer-band was that of Cataline! What Katzenjammer was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God.** By O. B. Frothingham. Price, 5 cents.  
**Lecture on the Bible.** By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
**Christian Propagandism.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
**God in the Constitution.** By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
**Compulsory Education.** By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
**The Present Heaven.** By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
**The God of Science.** By Francis Ellingwood Abbot. Price, 10 cents.  
**On the Vision of Heaven.** By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
**A Study of Religion.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
**The Battle of Syracuse.** Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
**The Bible and Science.** By John Weiss. Price, 10 cents.  
**The Sympathy of Religions.** By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
**Evolution and Religion.** By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
**Giordano Bruno and the Relation of his Philosophy to Free Thought.** By Thomas Davidson. Price, 10 cents.  
**Transcendentalism.** By Theodore Parker. 39 pages. Price, 5 cents.  
**The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen.** By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
**An Agnostic View of the Doctrine of Vicarious Atonement.** By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
**Evolution in its Relations to Evangelical Religion.** By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
**Messianic Expectations.** By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents; V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
**The Proposed Christian Amendment to the Constitution of the United States.** Price, 5 cents; 10 copies, 25 cents.  
**The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life.** By Lewis G. James. Price, 10 cents.  
**Social Ideals.** By David A. Wasson. Price, 10 cents.  
**The Decay of the Christian Church: its Causes and Remedy.** By Rev. J. C. F. Grumbine. Price, 15 cents.  
 A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## THE LEADING ORGAN

of British Thought on the American Continent

**"THE WEEK,"**

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$1.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,

## YOU SHOULD READ

**A M E R I C A.****WHY?**

Because it is the only paper in America that advocates *American rule* in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson,  
Sen. Teller, Sen. Mitchell, Sen. Dawes,  
Sen. Stewart, Hon. Theodore Roosevelt,  
Seth Low, Hon. Andrew D. White,  
Ella Wheeler Wilcox, Bishop Cox,  
Hon. James Russell Lowell, Admiral Porter,  
Charles Dudley Warner, James Whitcomb Riley,  
Frank R. Stockton, Edgar Fawcett,  
J. T. Trowbridge, Edgar Saltus, Robert Grant,  
Julian Hawthorne, W. Clark Russell,  
and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy, and can truthfully state that its principles are not worthy of the support of an American citizen, your money will be refunded on application to

## JET BLACK INK.

This Ink has now been in use for almost *TWELVE YEARS*, and the demand is constantly increasing. It is without doubt the *VERY BEST JET BLACK* ink. We submit the following facts.

1—*IT WRITES JET BLACK* instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2 oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

## BRENTANO'S,

5 Union Square, New York.

101 State Street, Chicago.

17 Avenue de l'Opera, Paris.

## CONTENTS OF FORMER NUMBERS OF "THE OPEN COURT."

## THE FIELD-INGERSOLL CONTROVERSY.

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Gladstone's Remarks upon the same will be found in Nos. 43 and 44. The questions and issues involved are treated from an independent and impartial standpoint. The inefficiency of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position and significance of both parties in the development of the religious idea are pointed out and each is recognized as important and necessary to the ultimate synthesis of religious truth, a religion which will in clude what is good in all.

## ETHICS AND PUBLIC LIFE.

W. M. SALTER.....In No. 45.

The well-known lecturer of the Society for Ethical Culture in Chicago bravely probes the wounds of our public life and shows his patriotism by boldly denouncing the evils and wrongs of American politics. But he is no pessimist; he does not despair of improvement and progress. He knows very well that men "of Roman virtue" still exist. Mr. Salter wants to elevate our conception of politics, so that the best men in the community would lose their repugnance to public life; that they would enter it once more to make it great and illustrious.

## MINERVA INSTITUTE, HIGHER SCHOOL for GIRLS,

N. E. Corner Paulina Street and Berceau Avenue,  
RAVENSWOOD, ILL.

This Day and Boarding School for Girls, besides a free course in English branches, Science, and Mathematics (preparatory to college), offers unusual advantages for the study of German and French with native resident-teachers, and excellent opportunity for art, music, elocution and needlework. The situation of the school in this quiet and attractive suburb warrants the promotion of health.

For Catalogue and Information apply to Mrs. Amalia Ende, Principal, P. O. Box 383, RAVENSWOOD, ILL.

### Recent Contributions to "The Open Court."

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 37, 33, 34, 36, 38, 40, 42, 44, 46, 48 and 51.

The Science of the thousand-fold *moral effects of physical causes* is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the *physical effects of moral causes*. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

#### ORIGIN OF REASON.

LUDWIG NOIRÉ. .... In No. 33.

An essay of great importance; will greatly help to explain the views of Max Müller. The same number contains an editorial upon Monism and Philosophy, in which is discussed the Identity of Language and Thought, the theories of Noire and Müller, and the proof with which modern philosophy has corroborated the monistic conception.

#### ECONOMIC CONFERENCES.

WHEELBARROW. .... In Nos. 37, 40, and 47.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon Simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

TRUTHS FOR THE TIMES. Endorsed by Darwin.

THE OPEN COURT,

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social and economic questions.

## RECENT CONTRIBUTIONS TO "THE OPEN COURT."

EDWARD, C. HEGELER

In No. 15, Mr. E. C. Hegeler explains his view of the soul. The soul, he says, is the form of a very complicated, self-acting mechanism of living substance; a part of its activity is accompanied with feeling; the feelings correspond in *form* to the most essential parts of the mechanism. The soul, as expressed by Bock, enters into our brain through the gateway of the senses. Reason is formed through the instrumentality of language. Noiré says: "Man thinks because he speaks." Immortality does not only mean the indestructibility of matter and energy but *soul preservation*. It implies not only continuance of life, but life in a special form. We can to a great extent renew ourselves by forming our soul in the growing generations through education and by example. To preserve and to elevate the *quality* of the human soul, that is the basis of ethics.

Pleasure and pain in the higher man of the future will, in quantity, probably be proportioned as now, but their form, their quality, will change \* \* \* Whether life is worth living is not the question of ethics, it is beyond our control. If civilized life does not continue, savage life, or even the life of brutes, will take its

place. As long as the sun shines upon our earth under similar conditions as now, so long the same quantity of life will continue upon its surface.

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Umlarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

EWALD HERING.

Nos. 22 and 3 contain a very eloquent article on "The Specific Energies of the Nervous System," by Dr. Ewald Hering, Professor of Physiology at the University of Prague. His useful additions to physiological science are enumerated in the *Encyclopædia Britannica*, under the heading of "Physiology." Several pages of the *Encyclopædia* are devoted to Dr. Hering. His discoveries make an era in physiological study, and we remind our readers of his learned and instructive essay on "Mem.ory," published in Nos. 6 and 7 of THE OPEN COURT.

Dr. Hering's article on the "Specific Energies of the Nervous System," while profound in argument and full of information in its details, is at the same time so simple in statement and so easily understood that the reading of it is a pleasure as well as a study. Such articles enable us to see farther into Nature than we formerly did, and they reveal to us that her "specific" work is much of it so delicate and fine that the most powerful microscope cannot make it visible to the material eye of man. Throughout the essay the following proposition is maintained: "The germs of each animal species possess an inherent and innate faculty, viz: a *specific energy* which directs its development in a manner characteristic to this animal and no other. Again, each single germ possesses an individual energy which, in addition to the normal features of its species, secures an individual character to its future development."

GEN. M. M. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. BINET.

Translated from the "Revue Philosophique" by *à propos*.

PART III.

*The Organs of Sense.* All the Micro-organisms are endowed with sensibility; some, like the Infusoria, have exceedingly sensitive powers. But, hitherto, organs of sense anatomically differentiated have been found in only a very small number of species. Generally, the protoplasmic expansions which we have above described under the name of pseudopodia are regarded as fulfilling the function of rudimentary organs of touch which advise the micro-organism of the presence of objects which happen in its path; but these pseudopodia, which at the same time serve as motor apparatus, do not exhibit any structure which especially fits them for the reception of sensory impressions. Similarly, Stein considers the vibratile cilia as organs of touch. As these are organs which have not undergone any differentiation, we shall not stop to consider them. The Infusoria belonging to the genus *Cryptochilum* (Maupas) carry at their posterior extremity a long rigid bristle, which M. Maupas regards as an organ of touch, intended to advise the animal of the approach of other Infusoria.

We shall speak more at length of the organ of sight; this has been the subject of numerous treatises, some of which are quite recent and of the greatest interest to general physiology and psychology. Of all the organs of sense the eye is the one which is first differentiated. It is found in the organisms belonging to the vegetable kingdom as well as in those belonging to the animal kingdom. While these small beings do not seem to possess any organ especially adapted by its structure for the reception of tactile, olfactory, or gustatory impressions, a large number already exhibit an ocular spot, that is to say a differentiated organ, for the purpose of sight and for no other purpose.

Let us first turn our attention to the eye of the Protozoa.

It is chiefly in the group of Flagellates, and principally in the species that are colored green by chlorophyll (for example the *Euglenæ*), that ocular spots are found; these spots which are colored a bright red, present themselves very clearly to the observation,

for they are set off by the uncolored plasma of the anterior part of the body where they are generally located. Oculiform spots are also found in the species colored by yellow chlorophyll (*Uroglena volvox*, etc.). Generally, there is only one spot, situated at the base of the flagellum. This is seen especially in the *Euglena viridis*, a small flagellate infusory, which is very abundant in fresh waters, which it often covers with a thick green coating.

In the *Synura nveila*, a colony-forming flagellate, there exist in each individual, in the anterior part of the body, numerous spots, varying from two to ten.

Below we give an illustration representing the anterior extremity of the *Euglena Ehrenbergii*, according to Klebs. A large ocular spot is noticeable, in contiguity with the contractile reservoir. Ehrenberg, deceived by the appearance of these two organs, had taken the contractile reservoir for a nerve ganglion.

It is not only in the large group of Protozoans that the red spots are met with; they are found also among the vegetable Micro-organisms. A large number of green-colored zoospores exhibit at the anterior, and usually colorless, extremity of their bodies, a small red point which seems to have exactly the

Fig. 6.—Anterior extremity of the *Euglena Ehrenbergii* (after Klebs). *a* = Eye. *b* = Mouth and gullet. *c* = Contractile vesicle. *r* = Contractile reservoir.

same structure as the red spot of the *Euglenæ*. It was on this fact that Stein based his opinion that the spot of *Euglena* is not an eye; to him it seemed impossible to admit that the vegetable Proto-organisms could possess a visual organ. This is an excellent instance of *a priori* reasoning. Later on we shall see that Stein's view has now been completely abandoned; the very opposite view is taken, for the eye of the Protista is considered as being destined to perform chiefly a vegetable function.

Klebs was able to study the structure of the ocular spots, by employing a very ingenious artifice. When the *Euglenæ* are treated with a solution of sea salt, in the proportion of one part to one hundred, an enormous dilatation of the contractile vesicle, which forms a hollow in the protoplasm of the animal, is induced; now, as the red spot is, so to speak, glued to the vesicle, it undergoes the same dilatation as the latter does,

\* Translation copyrighted.

thus greatly facilitating observation. By this treatment it has been observed that the spot is a small discoid or triangular mass, of jagged and irregular outline; it is formed of two material parts; for a base it has a small mass of reticulated protoplasm, and in the meshes of the protoplasm there are small drops of an oily substance, colored red.

This red pigment, which has received the name of hematochrome, is not without its analogy with the green pigment of the chlorophyl, because this latter becomes red under certain conditions. For example, the chlorophyl pigment which fills the entire body of the *Hematococcus pluvialis* becomes red, when the animal enters into a state of rest; the stagnant spores of the algæ also assume a red tint. So, also, in numerous plants, the parts of the flower destined to become red are green as long as they are enclosed in the bud. It is thus probable that the red pigment of the Euglenoids is derived from a green pigment.

What is the physiological significance of these spots? Ehrenberg considered them as eyes; hence the name *Euglena* (word for word, pretty eye), which he had given to a species of Flagellates provided with ocular spots. This interpretation had been questioned by all the authors of his time, especially by Dujardin. At the present day, however, naturalists have come back to it, in consequence of observations which have been made on other Micro-organisms that possess a more perfectly developed eye.

M. Pouchet has discovered in the *Glenodinium polyphemus*, which belongs to the group of Peridinia (or Dinoflagellates, according to the classification of Bütschli), an eye about the function of which there can be no mistake.

This eye occupies a fixed place in the cellule of the Peridinium; it has a uniform location and position. It consists of two parts, the one a veritable crystalline humor, and the other a veritable choroid. The crystalline is a strongly refracting, hyalin, club-shaped body, rounded at its free end, which is always directed forwards, while the other end is immersed in the mass of pigment which represents the choroid. This latter is clearly determined; it forms a sort of hemispherical cap, enveloping the posterior extremity of the crystalline. In one of the two forms of *Glenodinium polyphemus*, the choroid pigment is red; in the other it is black.

M. Pouchet has been able to establish that in the young animals the crystalline is first formed of six to eight refracting globes, which are merged into each other in order finally to constitute one unified mass. Also, the choroid is the result of a combination of the pigmentary granules which, at first sparse, group together and finally form the hemispheric cap that covers the posterior extremity of the crystalline.

In fact, the visual organ of this Peridinium is composed of exactly the same parts as the eye of a metazoön with one exception, the absence of the nerve element. This is not at all differentiated, but remains diffused, like the whole nervous system. M. Pouchet calls attention to the interest which his observation affords from a taxonomic point of view. The Peridinia have sometimes been classed among the vegetables; the presence of starch and of cellulose in their protoplasm has induced Warming to classify them among the Diatomaceæ and Desmidiaceæ. It is admitted to-day that certain Peridinia possess an eye, an organ which has hitherto been considered as the exclusive attribute of animals. Nothing more clearly emphasizes the altogether artificial character of the distinction between animals and vegetables than the results of dealing with Micro-organisms.

Before leaving the Peridinia, we would remark that these small beings afford an interesting fact from the point of view of the history of the Protozoa; they are provided with a long flagellum; they exhibit in addition an equatorial line on which formerly a crown of vibratile cilia was thought to be recognizable: this supposed co-existence of a flagellum and of cilia had determined the naturalists to form a group of Cilio-flagellates, serving as a transition between the Flagellates, properly so-called, and the Ciliates. Since then it has been discovered that the Peridinia do not possess vibratile cilia; what had given rise to this error is the presence of a second flagellum on the level of the transverse line which we have just described; the movements of this flagellum have the appearance of vibratile cilia in motion.

Some time before the investigations of M. Pouchet, M. Künstler (of Bordeaux) had discovered, in a Flagellate of the genus *Phacus*, a red eye which is also formed of two parts; it is composed of a homogenous globule, acting as a crystalline humor, and surrounded by a red pigment, acting the part of the choroid.

Before M. Künstler, Claparède and Lachmann, in their important work on Infusoria and Rhizopods, had described a similar visual organ in the *Freia elegans*, a ciliated infusory of the family of Stentorines. "Immediately behind the point of truncation," say they, "there is found a lunate spot of intense black, evidently belonging to the category of those phenomena which M. Ehrenberg, in the *Ophryoglenæ*, for example, calls an eye or an ocular spot. The significance of this spot has never been known. It was often very much denser than that of the *Ophryoglenæ*, and sometimes there was discovered behind it a very transparent corpuscle, which involuntarily gave rise in the mind to the idea of a crystalline humor. We cannot, however, add much of importance to this idea, since the functions of a refracting apparatus must neces-

sarily remain problematic, as long as we do not discover behind it a nervous apparatus fitted to perceive the impressions received."

This last conclusion seems to us excessively cautious. The co-existence of a pigment and of a crystalline humor amply suffices to characterize a visual organ. As to the nerve apparatus susceptible of perceiving impressions, it is replaced by the protoplasm, which, as is well known, is sensitive to light.

Even before that, in 1856, Lieberkühn had discovered in a ciliated infusory, the *Panophrys flavicans*, an ocular spot, composed of a convex crystalline humor, having the form of a watch-crystal enveloped by pigment and placed on the convex side of the oral fosse. In another species, the *Ophryoglena atra*, he found black pigment, but no crystalline humor.

It is impossible to believe that these organs are not eyes, for they have the same structure as the eyes of comparatively higher classes of animals, such as certain worms, turbellaria, rotifers, lower-class crustaceans, etc; all these organs are similarly formed of a small crystalline globule enclosed in a small mass of pigmentary matter. The identity of structure naturally leads to the assumption of the identity of functions.

The eye of the Euglena is the simplest of all; it is even reduced to the maximum point of simplicity, as it is composed of a spot of pigment. What induces us to believe that this spot is a visual organ, is the presence of this pigment. In fact this pigment is found in the most elementary visual organs. A second argument might be advanced; the red pigment of the Euglena exhibits the same re-actions as the coloring matter that fills the rods of the retina in the Vertebrates. From among these re-actions common to both, we cite the decoloration under the influence of light (Capranica).

Whatever the case may be, one thing is certain, namely that the Euglena is very sensitive to the light. When they are kept in a vessel, they are invariably seen to cover the side exposed to the light. M. Engelmann has observed that light acts very strongly upon this small animal; it does not act directly on the spot of pigment, nor, as was formerly thought, on the flagellum, but on the protoplasm which is located in front of the spot. The special micro-spectral object glass that M. Engelmann constructed, enables us to see that the Euglenæ always congregate in the band F to G of the spectrum.

So far as the vegetable Micro-organisms are concerned, we have already mentioned that a large number of the algæ zoöspores exhibit, in the anterior part of their body, ocular spots of a beautiful ruby color: these are organs that probably have the same structure as the red spots of the Eugleniæ. Moreover, it

is probable that certain Microphytes possess more complex visual organs, composed of red pigment and of a crystalline humor. M. Balbiani has recently testified to this fact in the case of the *Pandorina morum*, a spherical colony of green micro-organisms; in each colony there exists a certain number of individuals which possess a red spot, the shape of which is perfectly circular; if this spot be examined under a glass of very high magnifying power, one can readily see that it is formed of a small spherical globule, covered, on a portion of its surface, by a cap of red matter. This observation is all the more interesting because it is made on a being, the vegetable nature of which is to-day no longer doubted; the *Pandorina* are Volvocinæ which modern botanists place among the algæ. (We are glad to give our readers the earliest communication concerning this fact.)

If describing the eye of the Protista, we said that the eye is the only organ of sense which is distinctly differentiated in these lower beings. But, perhaps, this assertion is too sweeping. Some species appear armed with small organs which could easily be invested with a sensory function. In this respect, we may cite the *Loxodes rostrum*, a beautiful ciliated infusory, remarkable for its proboscis and for the muscular sheath which closes its mouth. This animal exhibits along the dorsal surface a row of small organs which, by their structure, seem destined to act a part in performing the function of hearing. They are formed of a vesicle, the centre of which is occupied by a refracting globule; they are called the vesicles of Müller, after Johannes Müller, who discovered them. The auditory organs which have been observed in Worms and the Cœlenterata are apparently composed of a vesiculiform capsule enclosing a solid concretion, called otolith. Thus it is possible that the vesicles of Müller may be auditory vesicles. Up to the present time this organ has not been met with in any other species of Protozoa.

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XIII.

HEREDITY—Continued.

The occasional futility of great learning, if combined with a penchant for a deductive method of reasoning, has perhaps never been more strikingly illustrated than in Arthur Schopenhauer's theory of hereditary intelligence. His fundamental axiom of considering the "Will" (or moral disposition) the primeval and essential constituent in the elements of the soul-organism, leads him to a variety of singular inferences and at last to the remarkable conclusion that

\* Copyrighted.

intelligence can be inherited only from the mother's side; character (the type of "Will") only from the father's. The abstruse *a priori* arguments in behalf of that hypothesis would deter even philosophical readers of his famous treatise, if they were not supported by an almost unparalleled array of countless and ingenious illustrations. Ancient and modern history, scripture, traditions, and family chronicles, are all made to contribute instances of able men descended from unintelligent, but "will-strong," sires and clever mothers, and the *possibility* of that result is certainly demonstrated with conclusive success, though the final inference is as certainly an illustration of an illusion which mediæval schoolmen used to define as the "*post hoc, ergo propter hoc*" fallacy, or the tendency to mistake a coincidence for the result of a causal connection.

Francis Galton's work would furnish abundant material for refuting the negative part of Schopenhauer's argument which goes to the length of denying the possibility of an hereditary transmission of intellectual abilities from father to son, but the rule that "the best way of exploding a superstition is to explain it," applies perhaps as well to the sophisms of Science. A partial explanation can be found in the biological law of moral heredity already mentioned, considered in connection with the circumstance that biographers for centuries almost confined their researches to male lines of ancestry. We have seen that moral dispositions (in consequence of their more potent sway) are transmitted from parents to children far more invariably than mental faculties, and biographical records, limited to the paternal half of genealogical antecedents, must naturally have dealt chiefly with facts apt to mislead even unprejudiced inquirers.

But a far more important circumstance is the influence of pre-natal agencies temporarily modifying the mental and moral characteristics of immediate ancestors. Ribot quotes a variety of apposite cases to explain occasional exception from the general law of heredity; but biologists have as yet failed to recognize the significance of the fact that the causes of intermittence chiefly affect the *paternal* half of ancestral influences. More than two thousand years ago Aristotle named the mental eclipse of intoxicated parents among the causes of idiocy, and it is safe to say that in the course of the last fifteen centuries ninety-nine per cent. of male, to one per cent. of female, ancestors have thus vitiated the intellectual type of their offspring. Wounds may produce an analogous effect. "In the course of Brown Sequard's masterly experiments on the functions of the nervous system," says Dr. Carpenter, "he discovered that after a partial lesion of the spinal cord of Guinea-pigs a slight pinching of the skin of the face would throw the animal

into a kind of epileptic convulsions. That this artificial epilepsy should be constantly producible even after the injury to the spinal cord seemed to have been entirely recovered from, was in itself sufficiently singular; . . . but it was far more wonderful that, when these epileptic Guinea-pigs bred together, their offspring showed the same predisposition, without having been themselves subjected to any lesion whatever, while no such tendency showed itself in any of the large number of young which were bred by the same accurate observer from parents that had not thus been operated upon."

Wounds on the head are well known to affect, more or less permanently, the mental equilibrium of the patient, and several modern pathologists record cases of soldiers, miners, etc., who had been prostrated by a fracture of the skull and who ever afterwards were subject to periodic headaches and intermittent fits of mental disorders. There is no doubt that affections of that sort are often hereditary, especially during the period immediately following the predisposing accident, and here again we may safely assume that in nine out of ten cases the inherited tendency has been transmitted from the male line of ancestors. Even among savage tribes who delegate all sorts of hard labor to the female slaves procured with or without the formality of a nuptial rite, the more perilous pursuits of war and the chase are reserved for the sterner sex; and statistics prove that among a hundred cases of external injuries admitted to our public hospitals there are eighty-five per cent. of male patients, a percentage which in time of war may rise to ninety-five or above. Sunstroke, business troubles, and paroxysms of wrath are all apt to initiate a predisposition to mental disorders and to claim a considerable plurality of male victims. A few years ago my attention was called to the case of a young southern business-man of excellent habits, who without any conceivable cause began to sink under the gradual progress of a disorder which the local physicians defined as "softening of the brain." He had always been more than usually careful of his health. His aversion to stimulants extended to tea and coffee; he had never used tobacco in any form. The affluence of his parents precluded the necessity for over-application to business, and his duties in that respect, had, indeed, been mostly confined to formalities of supervision, and had never been permitted to interfere with the leisure of his holidays and evening hours. There was no taint of mental disease on either side of his ancestors, and the genesis of his affliction seemed an absolute mystery, till his mother informed me that during the year preceding the birth of her only son, his father had been subject to fits of agonizing headaches, caused by a sunstroke and the absurd prescrip-

tions of an alcohol quack. On the other hand, a conjunction of favorable circumstances may transmit an intensified, or happily modified, form of ancestral faculties. The ancient Greeks surrounded child-bearing mothers with all the pleasant influences of nature and art, and Robert Burton suggests that the law of primogeniture was originally founded on the belief that the best faculties of a sire could be transmitted only under the influence of passionate love, a belief apparently shared by the philosopher Vanini, who goes so far as to regret the legitimacy of his birth, because "clandestine amours imply sincere passion, which in married life is soon superseded by the feeble substitute of marital duty." The custom of all nations makes the nuptial week a season of festivities, for reason perhaps analogous to those determining the pairing-season of animals and birds which in all but the highest latitudes so often coincides with the most pleasant time of the year. During the year preceding the birth of Francis Bacon both his parents were cheered by a series of happy events in the turn of their family affairs; Madame de Staël mentions that her father's first year of married life realized all his ideals of earthly happiness, and it is said that during the four months prior to the birth of Napoleon Bonaparte his mother lived in constant ecstasies of political excitements and adventures.

The consideration of such facts would abundantly explain the occasional variations from the type of ancestral characteristics, but at the same time complicate to an almost hopeless degree the difficulty of predicting, in any special case, the result of hereditary influences. Special faculties may become eliminated from a combination of talents deriving their efficiency from that very gift; the results of marriage may complement a brilliant but defective type of intellect or character, and the infinite number of possible combinations and modification must be admitted to include the following momentous chances:

- 1) Possibility of worst qualities inherited from both sides;
- 2) Advantages of one side neutralized by defects of the other;
- 3) Partial advantages of one side supplemented by favorable additions from the other;
- 4) Best qualities inherited from both sides.

The results of the first named contingency are illustrated in the characteristics of certain types of Spanish-American mongrels who seem to combine the restless passions of a Caucasian adventurer with the stupidity and the brutal vices of a degraded savage. A less dangerous, but even more repulsive, combination of ugly character-traits is said to result from the union of the indolent Malays and knavish Chinamen of the Sunda archipelago; and even the ethical toler-

ance of our Mexican neighbors is sometimes overtaken by the depravity of Chinese-African mongrels, who, in the words of a British traveler, "have just brains enough to be mean, and whose penchant for crimes against nature is limited only by their cowardice."

Slight modifications in a combination of character-traits may often completely change the practical result. A son of a gifted father may inherit the wit and the talents of his progenitor, but lack his energy; the children of a genial spendthrift may avoid his errors and their penalties by a grain of prudence; the boys of a profound but pedantic philosopher may achieve popularity by a leaven of mother-wit. "*Heroum filii noxae*," was a Latin proverb justified by the frequent phenomenon of misused energies inherited from an heroic father whose adventurous disposition was balanced by moral principles.

The hope of the fourth contingency is occasionally realized by the union of persons representing the types of advanced and yet contrasting civilizations, and thus wedding idealism to practical energy, or loyalty to a love of freedom. Education in a land of strangers, superadded to strength of mind, may lead to a curiously similar result, and we accordingly find that a list of great names on all rolls of fame includes a remarkable number of men, either of mixed blood or of composite citizenship: Napoleon, Columbus, Seneca, Trajan, Kanut, Mirabeau, Byron, Bruno, Anacharsis, Spinoza, Chamisso, Moses, Disraeli, Macmahon, Marshal Saxe, De Staël, Rousseau, Herschel, Arago, Vanduyck, Dumas, Heine.

It is a significant fact that during the brightest period of Pagan civilization the bonds of political separatism had been considerably relaxed; and the free inter-marriage of a population representing the most enterprising and intelligent tribes of the Caucasian race is perhaps the most favorable omen for the social future of our cosmopolitan republic.

(To be continued.)

#### HERBERT SPENCER ON THE ETHICS OF KANT.\*

Mr. Herbert Spencer has published in *The Popular Science Monthly* for August, an essay on the Ethics of Kant; a translation of this article had appeared in the July Number of the *Revue Philosophique*, and it cannot fail to have been widely noticed. It is to be regretted that unfamiliarity with the German language and perhaps also with Kant's terminology has led Mr. Spencer into errors to which attention is called in the following discussion.

Mr. Spencer says:

"If, before Kant uttered that often-quoted saying in which, 'with the stars of Heaven he coupled the conscience of Man, as 'being the two things that excited his awe, he had known more of

\* Quotations from Mr. Spencer's essay will be distinguished by quotation-marks, while those from Kant will appear in hanging indentations.

"Man than he did, he would probably have expressed himself somewhat otherwise."

Kant, in his famous dictum that two things excited his admiration, the starry heaven above him and the conscience within him, contrasted two kinds of sublimity.\* The grandeur of the Universe is that of size and extension, while the conscience of man commands respect for its moral dignity. The universe is wonderful in its expanse and in its order of mechanical regularity; the conscience of man is grand, being intelligent volition that aspires to be in harmony with universal laws.

Mr. Spencer continues:

"Not indeed, that the conscience of Man is not wonderful enough, whatever be its supposed genesis; but the wonderfulness of it is of a different kind according as we assume it to have been supernaturally given or infer that it has been naturally evolved. The knowledge of Man in that large sense which Anthropology expresses, had made, in Kant's day, but small advances. The books of travel were relatively few, and the facts which they contained concerning the human mind as existing in different races, had not been gathered together and generalized. In our days, the conscience of Man as inductively known has none of that universality of presence and unity of nature which Kant's saying tacitly assumes."

Mr. Spencer apparently supposes that Kant believed in a supernatural origin of the human conscience. This, however, is erroneous.

Mr. Spencer's error is excusable in consideration of the fact that some disciples of Kant have fallen into a similar error. Professor Adler, of New York, who attempts in the Societies for Ethical Culture to carry into effect the ethics of Pure Reason, maintains that the commandments of the *ought* and "the light that shines through them come from beyond, but its beams are broken as they pass through our terrestrial medium, and the full light in all its glory we can never see."

Ethics based on an unknowable power, is mysticism; and mysticism does not essentially differ from dualism and supernaturalism.

Kant's reasoning is far from mysticism and from supernaturalism. He was fully convinced that civilized man with his moral and intellectual abilities had naturally evolved from the lower state of an animal existence. We read in his essay, "Presumable Origin of the History of Mankind" (Muthmasslicher Anfang der Menschengeschichte. Editio Hartenstein, Vol. IV, p. 321):

"From this conception of the primitive history of mankind it follows that the departure of man from the paradise represented

to him by his reason as the earliest place of sojourn of his race, has been nothing else than the transition from the rude condition of a purely animal existence to the condition of a human being; a transition from the leading-strings of instinct to direction by reason, in a word, from the protectorate of nature to a status of freedom."

The view that the conscience of man is innate, in the sense of a non-natural, of a mysterious, or even of a supernatural origin, is untenable. Those disciples of Kant who entertain such views have certainly misinterpreted their great master, and the passages adduced by Mr. Spencer from so many sources are sufficient evidence of the fact that "there are widely different degrees" [we should rather say kinds] "of conscience in the different races." Mr. Spencer continues:

"Had Kant had these and kindred facts before him, his conception of the human mind, and consequently his ethical conception, would scarcely have been what they were. Believing, as he did, that one object of his awe—the stellar Universe—has been evolved,\* he might by evidence like the foregoing have been led to suspect that the other object of his awe—the human conscience—has been evolved; and has consequently a real nature unlike its apparent nature." \*\*\* "If, instead of assuming that conscience is simple because it seems simple to careless introspection he had entertained the hypothesis that it is perhaps complex—a consolidated product of multitudinous experiences received mainly by ancestors and added to by self—he might have arrived at a consistent system of Ethics." \*\*\*

In brief, as already implied, had Kant, instead of his incongruous beliefs that the celestial bodies have had an evolutionary origin, but that the minds of living beings on them, or at least on "one of them, have had a non-evolutionary origin, entertained the belief that both have arisen by Evolution, he would have been saved from the impossibilities of his Metaphysics, and the untenability of his Ethics."

Mr. Spencer believes that Kant had assumed conscience to be "simple, because it seems simple to careless introspection." But there is no evidence in Kant's works for this assumption. On the contrary, Kant reversed the old view of so-called "rational psychology" which considered conscience as innate and which was based on the error that consciousness is simple. Des Cartes's syllogism *cogito ergo sum* is based on this idea, which at the same time served as a philosophical evidence for the indestructibility and immortality of the *ego*. The simplicity of consciousness had been considered as an axiom, until Kant came and showed that it was a fallacy, a paralogism of pure reason. Dr. Noah Porter has written, from an apparently dualistic standpoint, a sketch entitled "The Ethics of Kant," in which he says:

"The skepticism and denials of Kant's speculative theory in respect to noumena, both material and psychical, had unfortunately cut him off from the possibility of recognizing the personal *ego* as anything more than a logical fiction."

Kant says in his "Critique of Pure Reason": †

\* The stellar Universe, of course, has not been evolved; Mr. Spencer means that according to Kant's mechanical explanation the planetary systems and Milky ways of the stellar Universe are in a state of constant evolution.

† Translation by J. M. D. Meiklejohn, pp. 244, 249.

\* Kant distinguishes two kinds of sublimity: 1) the mathematical, and 2) the dynamical. His definitions are: 1) sublime is that in comparison with which everything else is small; and 2) sublime is that the mere ability to conceive which shows a power of emotion (Gemüth), the latter transcending any measurement by the senses. [1] Erhaben ist, mit welchem im Vergleich alles andere klein ist. 2) Erhaben ist, was auch nur denken zu können ein Vermögen des Gemüths beweist, das jeden Maassstab der Sinne übertrifft. Editio Hartenstein, Vol. V, pp. 237, 238.]

"In the internal intuition there is nothing permanent, for the *Ego* is but the consciousness of my thought. \* \* \* From all this it is evident that rational psychology has its origin in a mere misunderstanding. The unity of consciousness, which lies at the basis of the categories, is considered to be an intuition of the subject as an object; and the category of substance is applied to the intuition. But this unity is nothing more than the unity in *thought*, by which no object is given; to which therefore the category of substance cannot be applied.\*"

Concerning the statement that Kant had believed in the non-evolutionary origin of living beings, we quote from his essay on *The Different Races of Men*, Chap. III, where Kant speaks of "the immediate causes of the origin of these different races." He says:

"The conditions (*Gründe*) which, inhering in the constitution of an organic body, determine a certain evolutionary process (*Auswicklung*) are called, if this process is concerned with particular parts, *germs*; if, on the other hand, it touches only the size or the relation of the parts to one another, I call it *natural capabilities* (*natürliche Anlagen*)."

And in a foot-note Kant makes the following remark:

"Ordinarily we accept the terms natural science (*Naturbeschreibung*) and natural history in one and the same sense. But it is evident that the knowledge of natural phenomena, as they *now are*, always leaves to be desired the knowledge of that which they *have been* before now and through what succession of modifications they have passed in order to have arrived, in every respect, to their present state. *Natural History*, which at present we almost entirely lack, would teach us the changes that have affected the form of the earth, likewise, the changes in the creatures of the earth (plants and animals), that they have suffered by natural transformations and, arising therefrom, the departures from the prototype of the original species, that they have experienced. It would probably trace a great number of apparently different varieties back to species of one and the same kind and would convert the present so intricate school-system of Natural Science into a natural system in conformity with reason." §

Kant has nowhere, so far as we know, made any objection to the idea of evolution. But he opposed the theory that all life should have originated from *one single kind*. In reviewing and epitomizing Joh. Gottfr. Herder's work, "*Ideen zur Geschichte der Menschheit*," Kant says:

\* Compare also Kant's "Proi. zu jeder künftigen Metaphysik," § 46.

† We call attention to Kant's peculiar expression, in this passage, of *Auswicklung* which has now yielded to the term *Entwicklung*.

‡ Die in der Natur eines organischen Körpers (Gewächses oder Thieres) liegenden Gründe einer bestimmten Auswicklung heißen, wenn diese Auswicklung besondere Theile betrifft, *Kerne*; betrifft sie aber nur die Grösse oder das Verhältniss der Theile unter einander, so nenne ich sie *natürliche Anlagen*.

§ Wir nehmen die Benennungen *Naturbeschreibung* und *Naturgeschichte* gemeinlich in einerlei Sinne. Allein es ist klar, dass die Kenntniss der Naturdinge, wie sie *jetzt sind*, immer noch die Erkenntniss von demjenigen wünschen lasse, was sie *ehemal gewesen sind* und durch welche Reihe von Veränderungen sie durchgegangen, um an jedem Ort in ihren gegenwärtigen Zustand zu gelangen. Die *Naturgeschichte*, woran es uns noch fast gänzlich fehlt, würde uns die Veränderung der Erdgestalt, imgleichen die der Erdschöpfung (Pflanzen und Thiere), die sie durch natürliche Wanderungen (sic! I take it as a misprint for *Wandelungen*) erlitten haben, und ihre daraus entsprungnen Abartungen von dem Urbilde der Stammgattung lehren. Sie würde vermuthlich eine grosse Menge scheinbar verschiedener Arten zu Racen ebendieselben Gattung zurückführen, und das jetzt so weitläufige Schulsystem der Naturbeschreibung in ein physisches System für den Verstand verwandeln.

\* \* \* "Book II, treats of organized matter on the earth. \* \* \* The beginnings of vegetation. \* \* \* The changes suffered by man and beast through climatic influences. \* \* \* In them all we find one prevailing form and a similar osseous structure. \* \* \* These transitional links render it not at all impossible that in marine animals, in plants, and, indeed, possibly in so-called inanimate substances, one and the same fundamental principle of organization may prevail, although infinitely cruder and more complex in operation. In the sight of eternal being, which beholds all things in one connection, it is possible that the structure of the ice-particle, while receiving form, and of the snowflake, while being crystallized, bears an analogous relation to the formation of the embryo in a mother's womb. \* \* \* The third book compares the structure of animals and plants with the organization of man. \* \* \* It was not because man was ordained to be a rational creature that upright stature was given him for using his limbs according to reason; on the contrary he acquired his reason as a consequence of his upright stature. \* \* \* From stone to crystals, from crystals to metals, from metals to plant-creation, from thence to the animal, and ultimately to man, we have seen the form of organization advancing, and with it the faculties and instincts of creatures becoming more diversified, until at last they all became united in the human form, in so far as the latter could comprise them. \* \* \* As the body increases by food, so does the mind by ideas; indeed, we notice here the same laws of assimilation, of growth, and of generation. In a word, an inner spiritual man is being formed within us, which has a nature of its own and which employs the body as an instrument merely. \* \* \* Our humanity is merely a preliminary training, the bud of a blossom to come. Step by step does nature cast off the ignoble and the base, while it builds and adds to the spiritual and continues to fashion the pure and refined with increasing niceness; thus are we in a position to hope from the artist-hand of nature that in that other existence our bud of humanity will also appear in its real and true form of divine manhood." \* \* \*

[Herder's idea of evolution would stand on the whole if his conception of "the spiritual" did not imply a preternatural agent.]

"The present state of man is probably the link of junction between two worlds. \* \* \* Yet man is not to investigate himself in this future state; he is to believe himself into it."

Kant makes no objection whatever to the evolutionary ideas of Herder. But Herder was not free from supernaturalism and from fantastic ideas in reference to the future development of man. He had not yet dropped the dualistic conception of the 'duplicity' of man and believed in the immortality of a distinct spiritual individual within his body. Kant's objection, therefore, is twofold; 1) against Herder's supernaturalism which leads him beyond this world; and, 2) against the descent of *all* species from *one* and *the same genus*. He says:

"In the gradation between the different species and individuals of a natural kingdom, nature shows us nothing else than the fact that it abandons individuals to total destruction and preserves the species alone. \* \* \* As concerns that *invisible* kingdom of active and independent forces, we fail to see why the author, after having believed he could confidently infer from organized beings, the existence of the rational prin-

ciple in man did not rather attribute this principle directly to him merely as spiritual nature, instead of lifting it out of chaos through the structural form of organized matter.

\* \* \* As to the gradation of organized beings, our author is not to be too severely reproached, if the scheme has not met the requirements of his conception, which extends so far beyond the limits of this world; for its application even to the natural kingdoms here on earth leads to nothing. The slight differences exhibited when species are compared with reference to their common points of resemblance, are, where there is such great multiplicity, a necessary consequence of just this multiplicity. The assumption of common kinship between them, inasmuch as one kind would have to spring from another and all from one original and primitive species, or from one and the same creative source (Mutterschoß)—the assumption of such a common kinship would lead to ideas so strange that reason shrinks from them, and we cannot attribute this idea to the author without doing him injustice. Concerning his suggestions in comparative anatomy through all species down to plants, the workers in natural science must judge for themselves whether the hints given for new observations, will be useful and whether they are justified. \* \* \*

It is desirable that our ingenious author who in the continuation of his work will find more *terra firma*, may somewhat restrain his bright genius, and that philosophy (which consists rather in pruning than in fostering luxuriant growth), may lead him to the perfection of his labors not through hints but through definite conceptions, not by imagination but by observation, not by a metaphysical or emotional phantasy but by reason, broad in its plan but careful in its work."

Kant rejected certain conceptions of evolution, but he did not at all show himself averse to the idea in general. He touched upon the subject only incidentally and it is certain that he did not especially favor or entertain the belief in a non-evolutionary origin of living beings.

Before proceeding to the main points of his criticism, Mr. Spencer calls attention to what he designates as Kant's *abnormal* reasoning. Mr. Spencer says:

"Something must be said concerning abnormal reasoning as compared with normal reasoning." \* \* \*

"Instead of setting out with a proposition of which the negation is inconceivable, it sets out with a proposition of which the affirmation is inconceivable, and therefrom proceeds to draw conclusions." \* \* \*

"The first sentence in Kant's first chapter runs thus: 'Nothing can possibly be conceived in the world, or even out of it, which can be called good without qualification, except a Good Will.' \* \* \*

"Most fallacies result from the habit of using words without fully rendering them into thoughts—passing them by with recognitions of their meanings as ordinarily used, without stopping to consider whether these meanings admit of being given to them in the cases named. Let us not rest satisfied with thinking vaguely of what is understood by 'a Good Will,' but let us interpret the words definitely. Will implies the consciousness of some end to be achieved. Exclude from it every idea of purpose, and the conception of Will disappears. An end of some kind being necessarily implied by the conception of Will, the quality of the Will is determined by the quality of the end contemplated. Will itself, considered apart from any distinguishing epithet, is not cognizable by Morality at all. It becomes cognizable by Morality only when it gains its character as good or bad by virtue of its contemplated end as good or bad." \* \* \*

"Kant tells us that a good will is one that is good in and for itself without reference to ends."

It is unfortunate that Mr. Spencer misunderstood the first sentence of Kant's book (*Grundlegung zur Metaphysik der Sitten*). Kant does not speak of "a good will without qualification," nor does the expression "without qualification" refer to "a will without reference to ends." Kant speaks of good will in opposition to other good things. Nothing, he says, can without qualification (*ohne Einschränkung*) be called good, except a good will.\* Dr. Porter sums up the first page of Kant's essay in the following words:

"The first section of the treatise opens with the memorable and often-quoted utterance, that 'nothing can be possibly conceived in the world, or even out of it, which can be called good without qualification, except a good will.' If character is compared with gifts of nature, as intelligence, courage, and gifts of fortune, as riches, health, or contentment, all these are defective, 'if there is not a good will to correct their possible perversion and to rectify the whole principle of acting, and adapt it to its end.' † A man who is endowed with every other good can never give pleasure to an impartial, rational spectator unless he possesses a good will. 'Thus a good will appears to constitute the indispensable condition of being worthy of happiness.' \* \* \* Moreover, a good will is good not for what it effects but for what it intends, even when it fails to accomplish its purposes, \* \* \* as when the man wills the good of another and is impotent to promote it, or actually effects just the opposite of what he proposes or wills."

In the passages quoted by Dr. Porter, Kant speaks of "the end to which good will adapts other goods"; and in another passage of the same book, Kant directly declares that "it is the end that serves the will as the objective ground of its self-determination." Mr. Spencer must have overlooked these sentences. Kant says:

"The will is conceived as a power of determining itself to action in accordance with the conception of certain laws. And such a power can only be met with in rational beings. Now it is the *END* that serves the will as the objective ground of its self-determination, and this end, if fixed by reason alone, must hold equally good for all rational creatures."

Kant rejects the idea that happiness is the end and purpose of life and at the same time he declares that ethics must be based not on the pursuit of happiness but on the categorical imperative or more popularly expressed on our sense of duty.

Mr. Spencer argues:

"One of the propositions contained in Kant's first chapter is 'that we find that the more a cultivated reason applies itself with deliberate purpose to the enjoyment of life and happiness, so much the more does the man fail of true satisfaction.' \* \* \*

"That which Kant should have said is that the exclusive pursuit of what are distinguished as pleasures and amusements is disappointing." \* \* \*

"It is not, as Kant says, guidance by 'a cultivated reason,'

\* The original of the first sentence reads: "Es ist überall nichts in der Welt, ja überhaupt auch ausser derselben zu denken möglich, was ohne Einschränkung gut könnte gehalten werden, als allein ein guter Wille."

† *Italicis auctoris.*

"which leads to disappointment, but guidance by an uncultivated reason."

The passage quoted by Mr. Spencer from Kant, reads in its context as follows:

"In the physical constitution of an organized being we take it for granted\* that no organ for any purpose will be found in that such as is also the fittest and best adapted for that purpose. If in a being possessing reason and will, the preservation, the prosperity, in a word, the happiness of that being, constituted the actual purpose of nature, nature had certainly adopted an extremely unwise expedient to this end, had it made the reason of that being the executive agent of its purposes in this matter. For all actions that it had to perform with this end in view, and the whole role of its conduct, would have been far more exactly prescribed by *instinct*, and this end would have been far more safely attained by this means than can ever take place through the instrumentality of *reason*." \* \* \*

"As a matter of fact we find that the more a cultivated reason occupies itself with the purpose of enjoying life and happiness, the farther does the person possessing it recede from the state of true contentment; and hence there arises in the case of many, and pre-eminently in the case of those most experienced in the exercise of reason, if they are only frank enough to confess it, a certain degree of misology or hate of reason; for after weighing every advantage that they derive, I will not say from the invention of all *arts* facilitating ordinary luxury, but even from the sciences, (which after all are in their eyes a luxury of the intellect,) they still discover that virtually they have burdened themselves more with toil and trouble than they have gained in point of happiness, and thus, in the end, they are more apt to envy than condemn the commoner type of men who are more immediately subject to the guidance of natural instinct alone, and who do not suffer their reason to influence in any great degree their acts and omissions."

Kant uses the expression "cultivated reason" not in opposition to "uncultivated reason," but "to instinct" as that inherited faculty which teaches a being to live in accordance with nature and its natural conditions, without the interference of thought and reflection.

That uncultivated reason would lead to disappointment, Kant never would have denied. He would have added: "It does more, it leads to a speedy ruin."

But if reason does not produce happiness, what then is the use of reason? Kant answers, reason produces in man the good will.

It is reason which enables man to form abstractions, to think in generalizations and to conceive the import of universal laws. When his will deliberately and consciously conforms to universal laws, it is good.

Kant says:

\*The phrase "we take it for granted" (in the original "nehmen wir es als Grundsatz an") reads in the translation quoted by Mr. Spencer: "we take it as a fundamental principle." Mr. Spencer objects to the passage declaring that there are many organs (such as rudimentary organs) in the construction of organized beings which serve no purpose. This however does not stand in contradiction to Kant's assumption that organs of organized beings serve a special purpose. The rudimentary organs have under other conditions served a purpose for which they then were fit and well adapted and are disappearing now because no longer used.

"Thus will (viz. the good will) can not be the sole and whole Good, but it must still be the highest Good and the condition necessary to everything else, even to all desire of happiness." \* \* \*

"To know what I have to do in order that my volition be good, requires on my part no far-reaching sagacity. Unexperienced in respect of the course of nature, unable to be prepared for all the occurrences transpiring therein, I simply ask myself: Can'st thou so will, that the maxim of thy conduct may become a universal law? Where it can not become a universal law, there the maxim of thy conduct is reprehensible, and that, too, not by reason of any disadvantage consequent thereupon to thee or even others, but because it is not fit to enter as a principle into a possible enactment of universal laws."

If a maxim of conduct is fit to enter as a principle into a possible enactment of universal laws, it will be found in harmony with the cosmical laws; if not, it must come in conflict with the order of things in the universe. It then cannot stand, and will, if persistently adhered to, lead (perhaps slowly but inevitably) to certain ruin.

Concerning the proposition that happiness may be regarded as the purpose of life Kant in his review of Herder's "Ideen zur Philosophie der Geschichte der Menschheit" Ed. H. IV, p. 190, speaks of the relativity of happiness and its insufficiency as a final aim of life:

\* \* \* "First of all the happiness of an animal, then that of a child and of a youth, and lastly that of man! In all epochs of human history, as well as among all classes and conditions of the same epoch, that happiness has obtained which was in exact conformity with the individual's ideas and the degree of his habituation to the conditions amid which he was born and raised. Indeed, it is not even possible to form a comparison of the degree of happiness nor to give precedence to one class of men or to one generation over another. \* \* \* If this shadow-picture of happiness, . . . were the actual aim of Providence, every man would have the measure of his own happiness within him. \* \* \* Does the author (Herder) think perhaps that, if the happy inhabitants of Otaheite had never been visited by more civilized peoples and were ordained to live in peaceful indolence for thousands of years to come—that we could give a satisfactory answer to the question why they should exist at all and whether it would not have been just as well that this island should be occupied by happy sheep and cattle as that it should be inhabited by men who are happy only through pure enjoyment?"

Concerning the mission or purpose of humanity and its ultimate realization, Kant interprets Herder's views as follows:

"It involves no contradiction to say that no individual member of all the offspring of the human race, but that only the species, fully attains its mission (Bestimmung). The mathematician may explain the matter in his way. The philosopher would say: the mission of the human race as a whole is *unceasing progress*, and the perfection (Vollendung) of this mission is a mere idea (although in every aspect a quite useful one) of the aim towards which, in conformity with the design of providence, we are to direct our endeavors."

We learn from the passages quoted from Kant that his idea of good will is neither mystical and su-

pernatural, nor is it vague. It is a conception as logically and definitely defined as any mathematical definition. Good will in the sense in which Kant defines it, is only possible in a reasonable being by the power of its reason. The good will is the intention of conforming to universal principles and thus of being in harmony with the All. This good will is the cornerstone of Kant's ethics; it appears as the categoric imperative of duty, so to act that the maxim of one's conduct may be fit to become a universal law. It is formulated in another passage: "Act so as if the maxim of thy conduct by thy volition were to become a natural law."

It is easily seen that, in Kant's conception, the *ought* of morals (viz. of the categoric imperative) does not stand in contradiction to the *must* of natural laws. Kant's conception is monistic, not dualistic. Kant says:

"The moral *ought* is man's inner, necessary volition as being a member of an intelligible world and is conceived by him as an ought only in so far as he considers himself also as a member of the sensory world."<sup>6</sup>

Our way of explaining it would be: Man *feels* in his activity the categoric imperative as an ought. So the snow crystal, if it were possessed of sensation, would *feel* its formation as an "ought." But both are, and to an outside observer will appear, as a "must."

#### THE LOST MANUSCRIPT.†

BY GUSTAV FREYTAG.

#### CHAPTER XXII.—THREE COUNCILS.

The year of the Rectorate had so changed the household and the current of Ilse's thoughts that she remarked with astonishment to her husband, "I feel as if I had just come from school into the bustle of the world." Her husband's days were engrossed with distracting business: difficult transactions between the University and Government, and vexatious occurrences among the students, took up a great portion of his time.

The evening, also, did not pass as in the first year, when Ilse watched the quiet labors of her husband, or listened to his friends; for many were occupied by the sessions of the Senate, and others by large parties, which, as Rector, he could not avoid. When their friends came to tea, the master of the house was often absent.

Ilse had taken her father's lessons to heart; she lived in the present, and avoided distracting thoughts. Her husband took pains to keep from her anything

that could disturb her repose of mind, and the intellectual diet which he now gave her did her good. When he again saw her in society in all her health and strength, with color in her cheeks and a cheerful expression in her countenance, he felt it his duty for ever to preserve this soul from the intrusion of conflicting ideas; and he was pleased that, by frequent intercourse with various kinds of men, and by the light bonds of a genial society, she began to feel at home in his circle. It delighted him, too, to find that her ingenuous nature was appreciated; and she was not only treated with distinction by the men, but was also a favorite with the ladies.

Ilse would not, however, allow her private converse—as she called the hours during which she received her husband's instruction—to be disturbed; she adhered to it with rigid strictness; and if a day was missed, the lost time had to be made up on the following one. But even these lessons took a different course. The Professor now read to her small extracts from old writers, who portrayed, in prose and verse, the attractive beauty of the life of the ancients; her innocent mind entered into the cheerful enjoyment of this strange world, and the impressions which she received agreed perfectly with the way in which she now regulated her own life. The Professor explained to her some of the poems of the Greek anthology and of Theocritus, and a few of the Roman lyrics; and, by way of comparison, he read to her the poems of the great German who, in a remarkable way, had been able to unite Greek beauty with German feeling.

At her reception, Ilse showed all the dignity of her position as the Rector's wife; every room was opened; the apartments were decorated and brilliantly illuminated; the heads of the University and city, with their wives, made their appearance in numbers; and the Prince and his Chamberlain did not fail to be present. Laura assisted gracefully in doing the honors, and quietly gave directions to the servants; cake and wine were passed around; the guests made themselves very agreeable, and separated in the highest spirits. The great evening had passed off happily; the Doctor and Laura had left; Ilse gave her last injunctions to Gabriel, and passed through the rooms once more, with the glad feeling that she had done honor to Felix and herself. She came into her dressing-room, and glanced into the mirror.

"You need not examine yourself critically," said the husband, "everything was beautiful; but the most beautiful of all was the Rector's wife."

"Damon, my shepherd," replied Ilse, "you are blinded. It is not the first time you have said this, but I like to hear it; you may still tell it often to me. But Felix," she continued, as she unloosed her hair, "there is something inspiring about such a

<sup>6</sup> Das moralische Sollen ist also ein eigenes notwendiges Wollen als Gliedes einer intelligiblen Welt, und wird nur sofern von ihm als Sollen gedacht, als er sich zugleich wie ein Glied der Sinnenwelt betrachtet. Ed. Hartenstein vol IV, p. 303.

† Translation copyrighted.

society even where people do nothing but talk. One does not carry away much of it, but still there is a pleasure in being among them; they are all so courteous and endeavor to appear to the best advantage, and each tries to please the other."

"They do not all succeed in giving a fair idea of what they are on such occasions, least of all we book-worms," replied Felix. "But there is no doubt these gatherings give a certain similarity of language and manner, and, finally, also of ideas to persons who live in the same circle. This is very necessary, for even those who live together often differ as much in their thoughts and feelings as if they had been born in different centuries. How did you like the Chamberlain?"

Ilse shook her head. "He is the most courteous and lively of all, and knows how to say something civil to every one; but one cannot trust him, for, as with an eel, one has no hold on him, and can never for a moment look into his heart. I prefer our Prince with his stiff manner. He talked to me about his sister to-day; she must be very clever and charming. To which of your centuries does he belong?"

"To the middle of the last," replied her husband, laughing; "he is a full century earlier than we are, of the period when men were divided into two classes—those who were fit to be received at Court, and serfs. But if you examine those about us, you will discover even greater disparities. There is our Gabriel, who in his prejudices and his poetry belongs to an age three centuries earlier than the present. His ways of thinking remind one of the time in which the great Reformers first educated our people to think. On the other hand, the hostile neighbors are, in many points of view, the representatives of two opposing tendencies which ran parallel to each other towards the end of the last century—in our house, obstinate rationalism; in the old people over there, a weak sentimentality."

"And what time do I belong to?" asked Ilse, placing herself before her husband.

"You are my dear wife," he exclaimed, trying to draw her towards him.

"I will tell you," continued Ilse, eluding him: "in your opinion, I belong to a former age, and once that made me more unhappy than I can express. But I no longer care about it. For when I can compel you to kiss my hand as often as I desire it"—the Professor was very willing—"when I see that it requires no persuasion to induce you to kiss me on the lips—it is not necessary that you should try it now,—I believe you. Further, when I observe that the learned gentleman is not disinclined to hand my slippers to me, and perhaps even my dressing gown—I do not wish to give you trouble now, but unhook my ear-rings and open

the jewel-box,—and when I, besides, observe that you are anxious to please me, that at my wish you took the wife of the Consistorial Councillor to dinner, whom you could not bear, and that you have bought me this beautiful dress, although you understand nothing about buying; when I, further, see that Magnificus is quite under my sway, that I have the keys of the pantry, and even manage the accounts; and, lastly, when I bear in mind that you, good bookworm, think me, your wife Ilse, worthy of a little discussion together with your Greeks and Romans, and that it is a pleasure to you when I understand a little of your learned writings—I come to the conclusion that you belong entirely to me, you and your century, and that it is quite indifferent to me in what period of the world's history my spirit originated. Then when I, the relic of a distant century, pinch your ear, as I do now, the great master of the present and future, and his philosophizing on the different natures of men, become simply ludicrous. Now that I have held this discourse, can you sleep quietly?"

"That would be difficult," replied the Professor, "whilst the learned housewife is fluttering about the bed, holding discourses in her dressing-gown which are more lengthy than those of a Roman philosopher, and whilst she rattles the doors of the cupboards and wanders about the room."

"My tyrant requires his coffee early in the morning, so it must be given out now, and I cannot sleep if I have not all the keys near me."

"I see nothing will be of any use," said the Professor, "but a serious exorcism."

"I must see whether there are any lights burning in the rooms." But immediately afterwards she knelt down by the bed, and threw her arms round his neck. "Everything is so charming in the world, Felix," exclaimed she; "let us humbly pray that our happiness may last."

Yes, you are happy, Ilse; but, as your father said, you have to thank your prudence for it, not your courage.

\* \* \*

When Ilse wrote to her father, to describe how the great evening party had passed off, she did not forget to add that her future Sovereign had been among the guests, and that she had had much intelligent conversation with him. Her father did not appear to attach much value to this last communication, for he answered, rather irritated, "If you are so influential an adviser, exert yourself to obtain a decision for us in regard to the highway. The affair has been before the magistrates for ten years; it is a shame that we should be so cut off from all the world. The gray has broken his leg. Our estate would be worth ten thou

sand dollars more if the Government were not so dilatory."

Ilse read the letter to her husband, and said, "We can tell the Prince about the road; he can arrange it with his father."

Her husband laughed. "I will not undertake this commission: it does not appear to me as if the Prince would have great influence with the Government."

"We will see about that," replied Ilse, gaily; "at the next opportunity I shall speak to him about it."

This opportunity soon occurred. The Consistorial Councillor, who was now Theological Dean, had a tea-party. It was a distinguished and dignified assembly, but not agreeable to Ilse; she had long mistrusted the piety of the Dean, for beneath the gown of the bland gentleman she clearly saw a fox's tail peeping out; in the speeches of the Dean's wife there was an unpleasant mixture of honey and gall. The rooms were small and hot, and the guests seemed bored; but the Hereditary Prince and his Chamberlain had promised to come. As he entered, the master of the house and some of the guests who were acquainted with the customs of the Court endeavored to form a line for his reception; but all their attempts were vain, from the heedlessness or obstinacy of most of the company. The Prince, led by the Dean, had to make his way through the groups up to the mistress of the house. His eyes turned from her sharp features and wandered about to where Ilse stood, like a being from another planet; she looked quite majestic; her ribbon head-dress sat like a coronet on her wavy hair, which in great abundance almost surrounded her head. The Prince looked shyly up to her, and could scarcely find proper words with which to accost her. When, after a short greeting, he again turned to the rest of the company, Ilse was displeased; she had expected more attention from their intimacy. She did not consider that his position in society was not that of a private man, and that he had to fulfill his princely duties before he could go about like others. Whilst with inward disgust he did what his position required of him, going slowly round, he went first to Ilse's husband, then to the other dignitaries; had some presented to him, and asked the questions that are considered right in these cases; but he waited impatiently for the time when fate would allow him to have a little conversation with his countrywoman. But he did his duty bravely; the Professor of History expressed his pleasure that some old chronicles of his country would be published, and endeavored, half-talking and half-teaching, to impress him with their importance. Meanwhile the Prince thought that the Rector's wife would, at least, sit at his left hand, the Chamberlain having pointed out to him that the Dean's wife might be at his right.

The affair was doubtful. The Dean's wife was certainly the hostess, but the evening had a certain official University tone about it, and Ilse was undoubtedly entitled to precedence among the professors' wives. Nevertheless, all question ceased to exist when the fact was considered that the Dean, on account of numerous presentations of theological works, and many letters of admiring homage, had been made by the reigning sovereign, Knight Commander of his order. He had been so exalted by this, as the Chamberlain explained, that the difference of dignity between the Magnificus and Dean was more than compensated, and the Dean's wife had therefore the first place. The Chamberlain acknowledged that in reality it was a matter of no consequence how people were seated here, for there could be no question of any right of rank in this society. But it would be more becoming for the Prince not to neglect all distinctions.

At his left, at all events, the Prince hoped to have Ilse. But even this hope was frustrated by the artfulness of the Dean's wife. For there was amongst the company a Colonel's wife; they were people of old family, but recently come to the place. The lady of the house lost no time in taking the Colonel's wife up to the Chamberlain, and on meeting, it turned out that they had common relations. By this the whole arrangement of rank at supper was disturbed. The lady claimed her right to be presented. The Chamberlain took her to the Prince, who cleverly anticipated the former's intention, and expressed a wish to make the lady's acquaintance.

"She allows herself to be presented to a student!" said little Mrs. Günther, astonished.

"That is a breach of social rights, which touches the dignity of woman," said Mrs. Struvelius, displeased.

"But she did it very nicely," said Ilse; "her manner with him pleases me."

The ladies did not know that the object of their remarks was, in this moment of apparent humiliation, enjoying the triumph of a higher position. The Prince, the Colonel's wife, and the Chamberlain for a short time formed a group, from which the light of the evening radiated, all three with the proud consciousness that they were united in a bond of fellowship among strangers.

The consequence of this presentation was that the Colonel's wife sat at the left of the Prince, and Ilse between two Deans opposite to him. It did not make it easier for the Prince to preserve his princely dignity when every time he looked up, he saw the eyes and curls of his countrywoman opposite to him. The evening passed slowly for him, and it was not till the party was breaking up that he had an opportunity of speaking to Ilse without restraint.

*(To be continued.)*

GEORGE M. GOULD.

In Nos. 24, 25 and 26 Mr. George M. Gould treats of "The Ethics of Economics" rather as a quality absent from our economic system than as a living principle belonging to it. His doctrine is that all things produced by human labor represent the expenditure of human life, and that dollars and dimes, being representatives of wealth or earnings, are as drops of precious human blood. Therefore, in order to a rightful ownership of dollars, we must earn them; we must return to society a share of our own lives equal to the quantity we have received from our fellow men. According to Mr. Gould, whenever we eat or drink we partake of a solemn eucharist, where "the shadowy ghost of humanity calls out to us: 'Take, eat; this is my body. Drink ye all of this, my blood which is shed for many.'" This is not to be understood metaphorically, he says, but as "an exact statement of the fact."

While perhaps the theory of economics presented by Mr. Gould may not be scientifically true in all its parts, the moral he draws from the actual facts of our industrial system is true enough for warning and for guidance. The partnership of capital and labor is the panacea of Mr. Gould, the solution of the labor question. But from his ideal plans of industrial emancipation he excludes unpleasant facts. He allows only profit-sharing to come in, and loss-sharing is never taken into calculation. Yet it is the possibility of loss that has thus far defeated the "co-operation" experiment. It is doubtful if the operatives in any great factory would accept the whole plant as a gift, if compelled to take it on the terms by which its owners run it, the chances of profit and loss.

There is some extravagance in his language, but that is only a measure of his benevolent impatience at the inequalities and wrongs which refuse to be cured by his remedies. That the "ethics of economics" lies in the doctrine of "equivalence for service" is very likely true, but there is a difference of opinion as to the correct measure of that "equivalence," and a still greater dispute as to the means by which that measure shall be legalized and enforced.

G. H. SCHNEIDER.

In No. 24 will be found an essay of profound and radical thought on "Reflex Motions" by G. H. Schneider. The chaos of the old psychology is cleared since modern psychology begins to discover the laws which govern the intellectual domain of the soul. Schneider shows that the activity of the mind can be resolved into pure reflex actions, and illustrates his view in the following diagrams:

A mechanical cause, say the pressure of a limb, produces a mechanical effect, viz., the motion of the limb.

The physiological aspect is more complicated. The mechanical cause (say the pressure of a limb) causes a mechanical effect (for instance, a compression of flesh). This mechanical effect produces a physiological cause (viz., a change of the chemical constituents in the muscle and nerve tissues). This physiological effect produces a mechanical cause (which may be a cramp of the muscle), and accordingly it causes as a further mechanical effect a prolonged contraction of the limb. The diagram for a physiological reflex motion is thus:

The physical reflex motion superadds the element of consciousness. A mechanical cause (say somebody receives a blow on his arm) produces a mechanical effect. This mechanical effect causes a physiological effect in the muscle and nerve tissues, which again is the cause of a psychological effect, as pain is felt. This psychological effect causes another psychological effect, which may result in a state of anger and desire for vengeance. This psychological effect again is the cause of a physiological effect. It acts on the motory nerves, which in their turn causes the motory muscles to contract and retaliate the blow. The blow returned is in this case the mechanical effect of the first mechanical cause, i. e. the blow received. The following diagram will explain it more fully:

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadburn and Prof. A. S. Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents; V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Jones. Price, 10 cents.  
Social Ideals. By David A. Wasson. Price, 10 cents.  
The Decay of the Christian Church: Its Causes and Remedy. By Rev. J. C. F. Grumbine. Price, 15 cents.

A complete set of the Pamphlets mentioned in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

Three Introductory Lectures

—on—

# The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
  2. The Identity of Language and Thought; and
  3. The Simplicity of Thought.
- With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street, Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

## PRESS NOTICES.

"The world-wide reputation of its author, as the greatest living authority on philological subjects, is enough to command the careful perusal and respectful consideration of all who may take up this little book."—*Chicago Legal Advertiser*.

"It will help to reconcile systems of philosophy hitherto supposed to be antagonistic."—*Toledo Weekly Blade*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The absurdity of the theory is manifest."—*New York Science*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

## THE INDIVIDUALITY OF ATOMS AND MOLECULES.

Rev. H. H. Higgins M. A. In Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *bläs*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesis endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problems of Memory."

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. Vogt. .... In Nos. 29, 31 and 34.

Just the *Kinetic* conception of the world's mechanism Vogt opposes his hypothesis of a *continuous* world-substance completely filling space and whose sole manifestation of power consists in *contraction* or *condensation*. He claims that the kinetic or mechanical theory which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-monism which transforms the most complex conditions and processes of psychical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt propounds his conception which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

I wish to sell 50 acres of land (re cleared and well fenced), with small frame house, in Western North Carolina. Fine fruit country, mountain trout, hunting. Price, \$500. M. C. O'BRYNE, Peru, Ill.

## YOU SHOULD READ

# AMERICA.

## WHY?

Because it is the only paper in America that advocates *American rule* in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson, Sen. Teller, Sen. Mitchell, Sen. Dawes, Sen. Stewart, Hon. Theodore Roosevelt, Seth Low, Hon. Andrew D. White, Ella Wheeler Wilcox, Bishop Cox, Hon. James Russell Lowell, Admiral Porter, Charles Dudley Warner, James Whitcomb Riley, Frank R. Stockton, Edgar Fawcett, J. T. Trowbridge, Edgar Saltus, Robert Grant, Julian Hawthorne, W. Clark Russell, and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

## JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

## FREDERICK MAY HOLLAND.

"Progressive Orthodoxy," by C. K. Whipple, in No. 25, is a very keen and rather sarcastic censure on "The American Board of Commissioners for Foreign Missions." The said "Board" declined to comply with the request of their missionaries to make a few changes in the plan of saving the savages. These innocents, it was experienced, object in an absurd benevolence to the plan of eternal damnation, so as to be lost for Christianity. Mr. Whipple, it seems, did not consider that the Board could not have acted otherwise, for it would have been an outright confession that the savages had converted the missionaries, a most illogical and very improper thing to do.

GUSTAV FREYTAG.

Commencing with No. 22 is a philosophic novel by Gustav Freytag. In this refined and interesting story the reader becomes acquainted with some strongly marked personalities, and hears from them some rich and rare philosophy. "What is the object of philosophy?" says Frau Rollmaus to the Professor.

"It endeavors to instruct men in the life of their own spirit, and thus to strengthen and improve them."

In the actions, conversation, and adventures of the characters we see this philosophy guiding, teaching and improving them and us. Here through the easy and pleasant method of novel reading we learn the secret inspiration which produces those wonderful phenomena, which hitherto have been considered the mysteries of life; here we see destiny directed and controlled by law, and all the phenomena of natural and physical life are comprehended as phases of one and the same. This monism or conception of the oneness of all life and all nature pervades all pages of this wonderful work of fiction.

EWALD HERING.

Nos. 22 and 23 contain a very eloquent article on "The Specific Energies of the Nervous System," by Dr. Ewald Hering, Professor of Physiology at the University of Prague. His useful additions to physiological science are enumerated in the *Encyclopaedia Britannica*, under the heading of "Physiology." Several pages of the *Encyclopaedia* are devoted to Dr. Hering. His discoveries make an era in physiological study, and we remind our readers of his learned and instructive essay on "Mem.ory," published in Nos. 6 and 7 of THE OPEN COURT.

Dr. Hering's article on the "Specific Energies of the Nervous System," while profound in argument and full of information in its details, is at the same time so simple in statement and so easily understood that the reading of it is a pleasure as well as a study. Such articles enable us to see farther into Nature than we formerly did, and they reveal to us that her "specific" work is much of it so delicate and fine that the most powerful microscope cannot make it visible to the material eye of man. Throughout the essay the following proposition is maintained: "The germs of each animal species possess an inherent and innate faculty, viz: a *specific energy* which directs its development in a manner characteristic to this animal and no other. Again, each single germ possesses an individual energy which, in addition to the normal features of its species, secures an individual character to its future development."

FR. HELBIG

In Nos. 22, 23 and 24 is a deeply philosophical essay, "The Fool in the Drama," by Franz Helbig, another German scholar whose works refer to the History of Civilization. In this essay are shown in a delightful way the wisdom and the folly of the fool in the drama, and his value, not only to the body politic, but to the morals of human life. In the folly of the fool in the drama we see our own folly; and the satire of the fool administered in jest leaves a lesson behind it that makes us think seriously when the laughter is done.

## THE FOUNDING OF OUR RELIGIOUS FREEDOM.

BY MONCURE D. CONWAY.

"Diversity of worship has divided the human race into seventy-two nations. From among all their dogmas I have selected one—the Divine Love." So wrote the Persian, Omar Khëyam, seven centuries ago. Among the nations founded by and for dissent was New England. Unfortunately, however, the dogma it selected from past diversities was not the Divine Love,—but deified Wrath.

In the century of the liberal Persian poet his Moslem world suffered invasion and massacre from six millions of Christians, marching under the banner of a teacher who said, "Love your enemies." Those Moslems were, as they are to-day, all Christians. Their sole offense was that they did not believe Jesus the equal of God, (Allah or Eloah,—for they preserved the very name of the Creator in the Hebrew Scriptures).

The loving faith of Omar Khëyam had to wait long for a nation to be founded on it. But at length the time came.

In 1796, President Washington sent to the Senate, by which it was ratified, a treaty with Tripoli, of which the following is the eight article: "As the Government of the United States of America is not in any sense founded on the Christian Religion—as it has in itself no character of enmity against the laws, religion or tranquility of Mussulmans—and as the said States have never entered into any war or act of hostility against any Mahometan nation, it is declared by the parties that no pretext arising from religious opinions shall ever produce an interruption of the harmony existing between the two countries."

Thus was the seventh century of the first Crusade on the Moslem world celebrated by the first President of the American Republic by a solemn severance of the New World from the intolerant traditions of Christendom. To the historic sense, the American affirmation may appear as an obelisk brought from the ancient battlefield of sectarian States, that its barbarous inscriptions may be contrasted with the "harmony" established where creeds are disestablished. But this liberation was not reached without intervening American inscriptions on the historic pillar thus made by Washington into a national landmark. Among these, some, which have not hitherto

seen the light, appear in old manuscripts before me, and make clearer the brave story of religious liberty in the Republic.

A hundred and fifty years ago the Church of England in Virginia was a somewhat secular, fashionable institution; its clergy were men of the world, but in a good sense. My ancestor, Parson Moncure, of Overwharton parish,—probably a fair specimen,—preached practical sermons, played a perfect game of whist, and bequeathed to his many children slaves whose births and baptisms are registered along with those of the said children. Once, while this parson was enjoying his rubber, a vestry deputation came to request that he would pray for rain on Sunday. "I will pray," said the old gentleman, "but—I lead trumps—but it won't rain till the moon changes." This clergyman was George Washington's pastor, in his veracious cherry-tree days.

But in those days came out of the North the apostle of Presbyterianism, Samuel Davies. Under his flame the genius of Patrick Henry flowered. The Virginia government tried to arrest this apostolate. In 1748, the King's Attorney contended that the propaganda of dissent was illegal. Davies pleaded the Act of Toleration. The Attorney said that did not extend to Virginia. "Then neither does the Act of Uniformity," answered Davies. The question was taken to England, where Davies was sustained. From that hour the devouter spirits of the colonial church were drawn into Presbyterianism, and the English branch in Virginia began to wither, morally and spiritually. The work was completed by the Revolution. The English Church in Virginia was necessarily Tory; the Presbyterian naturally radical,—that is in politics; for theologically it was reviving the superstitions and fears of primitive man. Such was the situation when the revolutionary convention of 1776 met at Williamsburg, the ancient capitol of Virginia. But now it appeared that the English Church of the Colony—its puritan elements drawn off—had become heretical as well as worldly. This, as we shall see, had much to do with the foundation of religious liberty in Virginia, which became the chief corner-stone of that established by the national constitution.

Edmund Randolph, the youngest member of this Virginia convention,—at that time a deist, but after-

wards an Episcopalian,—has left a manuscript history from which may be gathered an impression of the religious elements surrounding that assembly, from which issued the first declaration of independence, and of human rights, and the first republican constitution. "The two sects (English Church and Presbyterian) were contrasted by some striking circumstances. The Presbyterian clergy were indefatigable. Not depending upon the dead letter of written sermons, they understood the mechanism of haranguing, and had often been whetted in dispute on religious liberty, so nearly allied to civil. Those of the Church of England were planted on glebes, with comfortable houses, decent salaries, some perquisites, and a species of rank which was not wholly destitute of unction. To him who acquitted himself of parochial functions these comforts were secured, whether he ever converted a deist or softened the pangs of a sinner. He never asked himself whether he was felt by his audience. To this charge of lukewarmness there were some shining exceptions, and there were even a few who did not hesitate to confront the consequences of a revolution which boded no stability to them. The dissenters, on the other hand, were fed and clothed only as they merited the gratitude of their congregations. A change or modification of the ancient regime carried no terrors to their imagination."

When one considers the present puritanical type of Virginia religion, it appears hardly credible that in the last century the established church, and its University at Williamsburg, had developed rationalistic and secular tendencies similar to those of the Broad Church in England. Such, it would appear, must be the natural evolution of a church requiring the support of all sorts and conditions of men, and independent of theological tribunals, as was the Colonial Church, whose only Bishop was a half mythical being in London. It depended on the arm of flesh, and made but little of the dogmatic arm; whereas ever since its disestablishment the Episcopal Church has steadily become orthodox and evangelical. Lord Dunmore, Governor of Virginia at the outbreak of revolution, if not a rationalist himself, was indifferent to the creeds. His court at Williamsburg was looked on as a centre of worldliness and irreligion by the dissenters and the devout churchmen. The freethinkers, or "deists," had no quarrel with the church, and when at length some great men arose resolved to liberate religion from state, or state from religion, they were generally supposed to be dissenters and zealots. The sixteenth article of the Bill of Rights, says Edmund Randolph (MS.), "unfettering the exercise of religion, was proposed by Mr. (Patrick) Henry. Coming from a gentleman who was supposed to be a dissenter, it caused an appeal to him whether it was designed as a prelude

to an attack on the established church, and he disdained such an object." Henry was then and to the end of his life a member of the Episcopal Church. So also was Madison, and, unlike his rationalistic relative, the Bishop, he was thoroughly orthodox. That a churchman should wage war against the establishment was incredible in his case also. "I was diverted yesterday," Randolph writes him, "by Mr. John Pierce, of James City, (the delegate) asking whether you had not become a Methodist. After I had recovered from my surprise, I inquired from whom the rumor sprang. His account in reply was nothing more than that it was a general report in James City. It will be no easy matter to impress on some of your friends that you have fastened yourself to any sect." (MS.)

Though the church was disestablished, membership of any other body was still regarded as belonging to 'a sect'; it would so have been regarded by Madison's father and mother (she had been Nelly Conway). But the popular instinct, which could not believe that the establishment originated the spirit of disestablishment, was right. For some unavowed reason James Madison, contrary to the custom of Virginia gentry, was not sent to William and Mary College, but to Princeton. It was a sign that the great college at Williamsburg had come under suspicion of the pious and orthodox country churchmen. Edmund Randolph (MS.) says that in early life he himself was a deist,—“made so by my confidence in some whom I revered, and by the labors of two of my preceptors, who, though of the ministry, poisoned me with books of infidelity.” The clergymen who taught at William and Mary during Randolph's time (1766—71) were Horrocks, Camm, Dixon, Johnson, Henley, Gwatkin: it would be interesting to know which of these were the deists in clerical clothing. In the reference to “some whom I revered,” must be included his father, John Randolph, King's Attorney, whose nomination (twice) by Lord Dunmore to the Board of Visitors of the College was successfully resisted by John (afterwards Governor) Page, on the ground that he did not possess “the disposition and character, moral and religious, which the charter and statutes of the college required.” A note which I have seen from Bishop Meade shows that it was the Attorney's rationalism which chiefly offended Page, whose devoutness caused him to be at one time proposed for the bishoprick which passed to Madison,—who represented the rationalistic wing of the College, of which he was so long president. I suppose also that among the deists whom young Edmund “revered” was his uncle, Peyton Randolph, whose will, now before me, opens with the words, “In the name of God, Amen,” but is without the usual expressions of Christian faith and hope. Chan-

cellor Wythe, too, and Jefferson might be included. Randolph speaks of their coming to his house on Sunday to play chess, a procedure which his young wife rebuked by not appearing in the room, with result that the incident was not repeated; but Randolph did become a churchman. While this was going on at Williamsburg, the soul of Samuel Davies was "marching on." His eloquence had kindled not only the religious nature of Patrick Henry, but that of James Madison, Sr., also. Neither of them left the old church, but carried a new spirit into it. Princeton had been consecrated by the last ministrations of Davies, who, as we have seen, had been the means of extorting from the King's Attorney (the as yet "unevolved" Peyton Randolph) extension of the Act of Toleration to Virginia.\* James Madison, Jr., was trained for Princeton by the parish clergyman, Thomas Martin (inmate of Montpelier); and for the political principles of Princeton, by the persecutions of the Baptists in the neighborhood of that paternal home in Orange County. The clergy were not the persecutors, but the old ecclesiastical laws compelled magistrates to take sides with the mobs pursuing these early "Salvationists." To Princeton then went young Madison, aged 18; and the course of American history was influenced by the incident. From Princeton he brought a touchstone of presbyterian manufacture, which a statesman with the prestige of relationship to Bishop Madison, and the evangelical spirit of Davies, was able to apply to the ecclesiastical edifice, from within, with fatal effect.

Only an eye of Princeton could have detected a germ of intolerance in the original article of the Bill of Rights, to secure "the fullest toleration." By striking out the equivocal word "toleration," Madison anticipated the principle of Thomas Paine: "Toleration is not the opposite of intolerance, but is the counterfeit of it. Both are despotisms. The one assumes to itself the right of withholding liberty of conscience, the other of granting it." The two articles may be here compared.

## THE ORIGINAL.

That religion or the duty we owe to our Creator, and the manner of discharging it, can be directed only by reason and conviction, not by force or violence: and therefore that all men should enjoy the fullest toleration in the exercise of religion, according to the dictates of conscience, unpunished and unrestrained by the magistrate unless, under color of religion, any man disturb the peace, happiness, and safety of society. And that it is the mutual duty of all to practice Christian forbearance, love, and charity towards each other.

## MADISON.

That religion, or the duty we owe to our Creator and the manner of discharging it, being under the direction of reason and religion only, not of violence or compulsion, all men are equally entitled to the full and free exercise of it, according to the dictates of conscience, and, therefore, that no man or class of men ought, on account of religion, to be invested with peculiar emoluments or privileges, nor subjected to any penalties or disabilities unless, under color of religion, the preservation of equal liberty and the existence of the State be manifestly endangered.

\* The completeness of the victory won by Dr. Samuel Davies finds a somewhat picturesque latter-day illustration in the fact that his lineal descendant is now the Bishop of Virginia, in whose Low Church apostolate, and stern attitude towards worldliness, his ancestor's spirit re-appears. This Bishop Whittle is also a descendant of Pocahontas.

The Convention was not ready for Madison's radicalism, and his amendment, amounting to instant and complete disestablishment, was pruned in Committee and finally adopted in the following shape:—"That religion, or the duty we owe to our Creator, and the manner of discharging it, can be directed only by reason and conviction, not by force or violence, and therefore all men are equally entitled to the free exercise of religion, according to the dictates of conscience, and that it is the duty of all to practice Christian forbearance, love and charity towards each other."

(To be continued.)

## HERBERT SPENCER ON THE ETHICS OF KANT.

(Concluded.)

Mr. Spencer interrupts his essay on the Ethics of Kant by a digression on Kant's conception of time and space. It would lead us too far at present if we would follow Mr. Spencer on this ground also. A comparison of Spencer's remarks on the subject with Kant's "Critique of Pure Reason" will show that Kant's view of space and time is different from that view which Mr. Spencer represents as the Kantian conception of time and space.

\* \* \*

In the Spencerian system of ethics, which is utilitarianism, the moral maxim or the idea of duty is not distinguished from the feeling of pleasure or pain that accompanies ethical thoughts and acts, and their consequences. This lack of distinction induces Mr. Spencer to consider man's pursuit of happiness as the basis of ethics. Accordingly the aim of ethics, he maintains, is not the performance of duty, not the realization of the good; to the utilitarian this is only the means. The end of ethics is the greatest happiness of the greatest number.

It is strange that Mr. Spencer's essay contains a passage which, although intended as a point of objection to Kant, is a corroboration of Kant's ethics, and a refutation of Mr. Spencer's own views. While denying the statement that "a cultivated reason, if applied with deliberate purpose to the enjoyment of life and happiness, will fail to produce true satisfaction," Mr. Spencer says:

"I assert that it is untrue on the strength of personal experiences. In the course of my life there have occurred many intervals, averaging a month each, in which the pursuit of happiness was the sole object, and in which happiness was successfully pursued. How successfully may be judged from the fact that I would gladly live over again each of those periods without change, an assertion which I certainly cannot make of any portions of my life spent in the daily discharge of duties."

This statement, if it proves anything, proves that happiness is one thing and duty is another; it proves that Kant's theory of ethics, which is based on the discharge of duty and not on the pursuit of happiness,

is correct, and that Mr. Spencer's theory which identifies duty with the pursuit of happiness, is wrong.

However, we must in this place express our opinion that Mr. Spencer's statement *cannot* be quite correct. The discharge of duty, unpleasant though the drudgery part of it may have been, was undoubtedly accompanied and followed by a certain satisfaction, which perhaps was less in quantity, but certainly higher in quality than the pleasure derived from the mere pursuit of happiness. And in the valuation of the intrinsic and of the moral worth of pleasures, the quality alone should be taken into consideration, not the quantity. In this sense only can an ethical hedonism or utilitarianism be acceptable. The man whose pleasures and pains are of a higher kind, of a nobler form, and of a better quality, is morally and generally the more evolved man. And then, the basis of ethics would be, not so much pleasure or happiness as the quality of pleasure or happiness; it would be an aspiration to evolve toward a higher plane of life, to shape our lives in nobler forms, and to enjoy nobler, greater, and more spiritual pleasures, or, as Kant says, "unceasing progress."

Mr. Spencer's assertion, if taken in the sense in which it stands, is a contradiction of his ethical theory. But even if Mr. Spencer had declared that the discharge of duty affords a kind of happiness or satisfaction, as it truly does, there would still remain a deep gap between his and Kant's ethics. Mr. Spencer reduces ethics to mere worldly prudence; he says that we must do the good in order to be happy, and for the sake of its utility, and Kant says we must do the good for the sake of the good. Mr. Spencer says:

"But now, supposing we accept Kant's statement in full, 'what is its implication? That happiness is the thing to be desired, and, in one way or another, the thing to be achieved.' \* \* \*

"An illustration will best show how the matter stands. To a 'tyro in archery the instructor says: 'Sir, you must not point your arrow directly at the target; if you do, you will inevitably miss it; you must aim high above the target, and you may then possibly pierce the bull's-eye.' What now is implied by the 'warning and the advice? Clearly that the purpose is to hit the target. Otherwise there is no sense in the remark that it will be missed if directly aimed at; and no sense in the remark that 'to be hit, something higher must be aimed at. Similarly with 'happiness. There is no sense in the remark that happiness will 'not be found if it is directly sought, unless happiness is a thing 'to be somehow or other obtained.' \* \* \*

"So that in this professed repudiation of happiness as an end, there lies the unavoidable implication that it is the end."

The pursuit of happiness is by no means repudiated by Kant as wrong or immoral; it is only maintained to be insufficient as a foundation of ethics. Kant's remark that happiness will not be found if it is directly sought has no reference to his own ethics. Kant, speaking from the standpoint of one who takes

the view of utilitarianism, says that if a cultivated reason applies itself to the sole purpose of enjoying life and happiness, it will meet with a failure.\*

Any other explanation of the moral *ought* than that from the Good Will, Kant declares to be *heteronomy*. Will would no longer be itself, and the principle of action would lie in something foreign to the will. Kant says:

"Will in such a case would not be a law to itself; but the object by its relation to the will would impose the law upon the will." \* \* \* This would admit of hypothetical imperatives only: 'I ought to do a certain thing, because I want something else.' The moral and therefore categorical imperative, on the contrary, says: 'I ought to act so or so, even if I had nothing else in view.' For instance: the hypothetical imperative of heteronomy says: 'I ought not to lie, if I ever wish to preserve my honor.' The categorical imperative says: 'I ought not to lie even if it would not in the least bring me to shame.'"

Mr. Spencer quotes the following passage from Kant:

"I omit here all actions which are already recognized as inconsistent with duty, although they may be useful for this or that purpose, for with these the question whether they are done *from duty* can not arise at all, since they even conflict with it. I also set aside those actions which really conform to duty, but to which men have no direct inclination, performing them because they are impelled thereto by some other inclination. For in this case we can readily distinguish whether the action which agrees with duty is done *from duty*, or from a selfish view. It is much harder to make this distinction when the action accords with duty, and the subject has besides a *direct inclination* to it. For example, it is always a matter of duty that a dealer should not overcharge an inexperienced purchaser, and wherever there is much commerce the prudent tradesman does not overcharge, but keeps a fixed price for every one, so that a child buys of him as well as any other. Men are thus *honestly* served; but this is not enough to make us believe that the tradesman has so acted from duty and from principles of honesty: his own advantage required it; it is out of the question in this case to suppose that he might besides have a direct inclination in favor of the buyers, so that, as it were, from love he should give no advantage to one over another [1]. Accordingly the action was done neither from duty nor from direct inclination, but merely with a selfish view.

"On the other hand, it is a duty to maintain one's life, and, in addition, every one has also a direct inclination to do so. But on this account the often anxious care which most men take for it has no intrinsic worth, and their maxim has no moral import. They preserve their life *as duty requires*, no doubt, but not *because duty requires*. On the other hand, if adversity and hopeless sorrow have completely taken away the relish for life; if the unfortunate one, strong in mind, indignant at his fate rather than desponding or dejected, wishes for death, and yet preserves his life without loving it—not from inclination or fear, but from duty—then his maxim has a moral worth.

"To be beneficent when we can is a duty; and besides this, there are many minds so sympathetically constituted that without any other motive of vanity or self-interest, they find a pleasure in spreading joy around them, and can take delight in the satisfaction of others so far as it is their own work. But

\*The passage referred to is quoted in full on page 1159, of THE OPEN COURT, N. 51.

I maintain that in such a case an action of this kind, however proper, however amiable it may be, has nevertheless no true moral worth, but is on a level with other inclinations" (pp. 17-19).

Kant's metaphysics of ethics is to practical ethics what pure mathematics is to applied mathematics, or what logic is to grammar. Kant's method of reasoning in *abstracto* everywhere shows the mathematical bent of his mind. In a foot-note (Editio Hartenstein, IV), p. 258, he says:

"As pure mathematics is distinguished from applied mathematics and pure logic from applied logic, so may the pure philosophy (the metaphysics) of ethics be distinguished from the applied philosophy of ethics, that is, as applied to human nature. By this distinction of terms it at once appears that ethical principles are not based upon the peculiarities of human nature but that they must be existent by themselves *a priori*,—whence, for human nature, just as well as for any rational nature, practical rules can be derived."

Schleiermacher says:

"A good is any agreement ('unity') of definite sides [certain aspects] of reason and nature. \* \* \* The end of ethical praxis is the highest good, *i. e.*, the sum of all unions of nature and reason. \* \* \* The moral law may be compared to the algebraic formula which (in analytical geometry) determines the course [path] of a curve; the highest good may be compared to the curve itself, and virtue, or moral power, to an instrument arranged for the purpose of constructing the curve according to the formula." (Quoted from a translation of Ueberweg.)

Kant declares in other passages that in examples taken from practical life, it will be difficult to separate clearly and unmistakably the sense of duty as the real moral motive from other motives, inclinations, habits, etc. But such a distinction must be made, if the moral value of motives is to be considered in *abstracto*. This is necessary for a clear conception of the essential features of morality. Mr. Spencer has on other occasions highly praised the power of generalization, which indeed is fundamentally the same faculty, as thinking in *abstracto*; here, however, he does not follow Kant's argument, but declares "that the assumed distinction between sense of duty and inclination is untenable." He says:

"The very expression *sense* of duty implies that the mental state signified is a feeling; and if a feeling it must, like other feelings, be gratified by acts of one kind and offended by acts of an opposite kind. If we take the name conscience, which is equivalent to sense of duty, we see the same thing. The common expressions 'a tender conscience,' 'a seared conscience,' indicate the perception that conscience is a feeling—a feeling which has its satisfactions and dissatisfactions, and which inclines a man to acts which yield the one and avoid the other—produces an inclination." (p. 476).

It is quite true that every state of consciousness is a feeling, but we can and must discriminate between consciousness or feeling and the idea or thought which becomes conscious, in which the feeling appears, and which is, so to speak, the special form of a certain

feeling. The consciousness and its special form, the feeling and the mental object of feeling, are in reality one and the same. Yet they are different and must in *abstracto* be well distinguished. Mr. Spencer's method is that of generalization, but generalizing can lead to no satisfactory results, if it is not constantly accompanied by discrimination. We must generalize and discriminate.

If a certain group of states of consciousness takes the form of a logical syllogism, it must not be expected that logic will find its explanation in feeling, although it cannot be denied that all the states of consciousness are feelings. Not the feeling in this case is to be explained, but logic. In our generalizations we must discriminate in *abstracto* between the feeling and the idea which feels. We must positively abstract from feeling and cannot consider whether the feeling of logical arguments is pleasant or unpleasant. Mr. Spencer's method of explaining ethics, if applied to logic, would be as follows: "Man's logical sense is a very complex feeling and has developed from simple percepts such as can be observed in the lowest animals; percepts are a higher evolved form of reactions against irritations such as take place in protoplasm. The old method of explaining logic is that of deduction, modern logic will be inductive. Formerly pure logic was considered as a science *a priori*; but the evolution-philosophy shows that logic is developed by steps, it appears *a priori* to the individual now, but it is in reality a consolidated product of multitudinous experiences received mainly by ancestors and added to by self. Logical sense accordingly finds its explanation in most simple feelings. Our conceptions of logically incorrect feelings will be more and more avoided because they will ultimately be found to be unpleasant; logical correctness is striven for because of the feeling of satisfaction that accompanies the conception of a logically correct conclusion."

Sense is feeling, there can be no doubt. Logical sense and mathematical sense are feelings and if a person thinks a mathematical axiom or a logical syllogism or an ethical maxim, he has a feeling. Logical sense of reason is the product of evolution, and it cannot be denied either that one man has a more logical or mathematical or moral sense<sup>\*</sup> than another. But it

\* Mr. Spencer adduces the following quotations in evidence for his assertion that conscience (or sense of duty) varies among the different races:

"In fact, I believe that the lower races of men may be said to be deficient in the idea of right.... That there should be any races of men so deficient in moral feeling, was altogether opposed to the preconceived ideas with which I commenced the study of savage life, and I have arrived at the conviction by slow degrees, and even with reluctance."—Lubbock, *Origin of Civilization*, 1882, pp. 404, 405.

"But now let us look at the evidence from which this impression is derived, as we find it in the testimonies of travelers and missionaries."

does not follow that an explanation of mathematics, or logic, or ethics, must be derived from feeling

Praising his deceased son, Tui Thakau, a Fijian Chief, concluded "by speaking of his daring spirit and consummate cruelty, as he could kill his own wives if they offended him, and eat them afterwards."—*Western Pacific*. J. E. BASKIN, p. 248.

"Shedding of blood is to him no crime, but a glory... to be somehow an acknowledged murderer is the object of the Fijian's restless ambition."—*Fiji and the Fijians*. REV. T. WILLIAMS, I, p. 112.

"It is a melancholy fact that when they [the Zulu boys] have arrived at a very early age, should their mothers attempt to chastise them, such is the law, that these lads are at the moment allowed to kill their mothers."—*Travels and Adventures in Southern Africa*. G. THOMPSON, II, p. 418.

"Murder, adultery, thievery, and all other such like crimes, are here [Gold Coast] accounted no sins."—*Description of the Coast of Guinea*. W. BOSMAN, p. 130.

"The accusing conscience is unknown to him [the East African]. His only fear after committing a treacherous murder is that of being haunted by the angry ghost of the dead."—*Lake Regions of Central Africa*. R. F. BURTON, II, p. 336.

"I never could make them [East Africans] understand the existence of good principle."—*The Allot Nyanza*. S. W. BAKER, I, p. 241.

"The Damaras kill useless and worn-out people: even sons smother their sick fathers."—*Narrative of an Explorer in Tropical South Africa*. F. GALTON, p. 112.

"The Damaras 'seem to have no perceptible notion of right and wrong.'"—*Ibid.*, p. 72.

Mr. Spencer adds:

"Against these we may set some converse facts. At the other extreme we have a few Eastern tribes—pagans they are called—who practice the virtues which Western nations—Christians they are called—do but teach. While Europeans thirst for blood revenge in much the same way as the lowest savages, there are some simple people of the Indian Hills, as the Lepchas, who 'are singularly forgiving of injuries;\*' and Campbell exemplifies 'the effect of a very strong sense of duty† on one of these savages.' That character which the creed of Christendom is supposed to foster, is exhibited in high degree by the Arafuras (Papuan) who live in 'peace and brotherly love with one another'‡ to such extent that government is but normal. And 'concerning various of the Indian Hill-tribes, as the Santals, Sowahs, Marias, Lepchas, Bodo and Dhimals, different observers testify of them severally that 'they were the most truthful set of men I ever met,§ 'crime and criminal officers are 'almost unknown,¶ 'a pleasing feature in their character is their 'complete truthfulness,|| 'they bear a singular character for 'truthfulness and honesty,\*\* they are 'wonderfully honest,†† 'honest and truthful in deed and word.‡‡ Irrespective of race, 'we find these traits in men who are, and have long been, absolutely peaceful (the uniform antecedent); be they the Jakuns of 'the South Malayan Peninsula, who 'are never known to steal 'anything, not even the most insignificant trifle,§§ or he it in the 'Hos of the Himalaya, among whom 'a reflection on a man's 'honesty or veracity may be sufficient to send him to self-destruction.¶¶ So that in respect of conscience these uncivilized 'people are superior to average Europeans, as average Europeans 'are superior to the brutal savages previously described."

pleasure and pain, or happiness. On the contrary we must abstract from feeling altogether and concern ourselves with the object of feeling only, which is the idea or the special form in which and as which feeling appears. States of consciousness (never mind whether they are painful or pleasurable) must be considered as moral if their mental object, *i. e.*, the idea, the thought, the motive, the form in which feeling becomes manifest, is in harmony with the universal order of things.

Mr. Spencer declares that the world would be intolerable "if Kant's conception of moral worth were displayed universally in men's acts." And it must be acknowledged that Kant's ethics in their logical and irrefutable rigidity not only impressed the literary world of his time with the grandeur and sublimity of ethics; Kant's ethics also astounded, and overwhelmed his readers with awe. Virtue no longer appeared to be the fervid enthusiasm of sentiments; it congealed into the cold idea of duty which can be fixed in abstract rules and will operate like the correctly calculated gear of a machine. Objections have been raised by some of Kant's own disciples; but it must be known that the Kantian view of ethics does not suppress feelings, emotions and inclinations, it excludes them only from an estimation of the moral worth of actions. Kant gave the *coup de grace* to all sentimentality which had taken the lead in ethical questions too long. Mr. Spencer says:

"If those acts only have moral worth which are done from 'a sense of duty \* \* \* we must say that a man's moral 'worth is greater in proportion as the strength of his sense of 'duty is such that he does the right thing not only apart from 'inclination but against inclination. According to Kant, then, 'the most moral man is the man \* \* \* who says of another 'that which is true though he would like to injure him by a false 'hood; who lends money to his brother though he would prefer to 'see him in distress."

Schiller, although an admirer of Kant, makes in his *Xenions* a similar objection to this corollary of the ethics of pure reason. He says:

"Willingly serve I my friends; but 'tis ploy, I do it with pleasure.

And I am really vexed, that there's no virtue in me!"

And he answers in a second distich:

"There is no other advice than that you try to despise friends,

And, with disgust, you will do what such a duty demands."

The difficulty is removed under the following consideration: A man with good inclinations is less exposed to temptation than a man with bad inclinations. If both act morally under conditions otherwise the same, the latter has shown greater strength of moral purpose than the former. The former's character (*viz.*, his inherited inclinations and habits which represent the sum total of the moral energies of his ancestors,) is more moral than that of the latter. But the latter deserves more credit than the former for overcoming the temptation; he has in this special act shown more moral strength of will than his more fortunate

and morally higher advanced fellow-man. To those who have accepted the Kantian view, Mr. Spencer's and Schiller's objection can serve as a warning, not to lose sight of emotions altogether. Man is not only a reasonable being, he is at the same time a feeling creature. The instinctive faculties of man, the so-called subconscious states, are the basis of his consciousness. They form the roots of his soul from which spring the clear conceptions of his reason. The more man's habits and inclinations agree with morals, the more strength of purpose is left for further ethical advancement and moral progress.

Similar objections have also been made to Kant's mechanical explanation of the origin of the planetary systems and milky ways. It seemed as if the divinity of nature were replaced by the rigid law of gravity. In his poem "The Gods of Greece," Schiller complains:

"Fühlos selbst für ihres Künstlers Ehre,  
Gleich dem toten Schlag der Pendeluhr,  
Dient sie knechtisch dem Gesetz der Schwere,  
Die entgötterte Natur."

"Dead even to her Master's praise,  
Like lifeless pendulum's vibration,  
Lo, godless Nature now obeys,  
Slave-like, the law of gravitation." \*

Such objections are always raised when a scientific explanation destroys the mystic view that a spirit or at least something unexplainable is the supposed cause of certain phenomena. Our sentiments are so closely connected and intimately interwoven with our errors that truth appears hostile to sentiment, and it becomes difficult to part with errors sanctified by emotion. Sentimentality always complains that clear thought is an enemy of romanticism, and romanticism is the only possible poetry to the taste of the sentimental.

Now it cannot be denied that a one-sided knowledge not only appears rigid, it truly *is* so, and will be destructive of such emotions as reverence, awe, aesthetic taste, religion and art. Criticism is a most essential feature of science and philosophy, and how negative, how desolate and melancholy appear the results of criticism! But the pruning process of criticism is very wholesome, and true science will only profit by discarding the vagueness of indistinct conceptions. Alpine lakes that are really deep can only gain by lucidity. Thus the clearness of genuine science and broad philosophy will only show the depth of truth into which by all its lucidity our emotions can plunge without ever finding it shallow or fathoming it in all its profundity.

Kant's doctrine of ethics is a truth that can stand the severest test.

Ethics, in the sense of the word as used by Kant,

can be found in man only, in so far as he is a reasonable being. A truly reasonable being does not allow himself to be guided by impulses but is led by maxims. Inclinations and habits are remnants of instinct. Not he who in instinctive good-naturedness acts morally, is the ethical man, but he who deliberately and consciously considers himself a representative of the general order of things. The man, who adopts such maxims as can become universal principles, identifies his will with the laws of the universe. Man's moral dignity must not be sought in vague feelings or in instinctive inspirations; it is based upon his reason and is developed in so far only as he makes use of his reason.

#### HAPPINESS AND ETHICS.

BY E. C. HEGELER.

Taking an especial interest in Mr. Spencer's Criticism of Kant's Ethics, and the Editorial in reference thereto, I here again present the following ideas:

Occurrences in man's life, some of them accompanied with pain, and others with pleasure, contribute to his higher evolution. From this fact we may conclude that the proportion of pleasure and pain will be such as will accompany man's greatest progress; for those nations only will survive which remain at the head of civilization. Therefore, pleasure and pain in the higher man of the future will in quantity probably be proportioned as now; but their form, their quality, will change.

A certain quantity of a more evolved quality of happiness will probably be accompanied by a corresponding quantity of a more evolved quality of unhappiness.

If a nation does not act in accordance with the ethics of progress or evolution, but with an ethics of perfection or completeness, (while it may experience the greatest quantity of happiness), it will remain behind, as the animal species and those human races which no longer progress, or it will perish entirely.

A nation may be imagined to have as its ethics rules of conduct aiming at a more animal state of existence, bringing with it a proportionately larger quantity of happiness. Its conduct would conflict with that of the All (the whole Reality) here on earth, which is the standard of true Ethics; and, therefore, its rules of conduct would be bad. Such a nation will soon perish, and with it its erroneous ethics.

Whether life is worth living—which saying Mr. Spencer prominently quotes in deducing his theory of ethics in his Data of Ethics—is a question we cannot ask, as it is beyond our control. If civilized life does not continue, savage life, or even the life of brutes, will take its place. As long as the sun shines upon our earth under similar conditions as now, so long the same quantity of life will apparently continue upon its surface.

\* Slightly altered from B. W. BALL's translation in THE OPEN COURT, p. 83.

## CORRESPONDENCE.

## A MEETING WITH THE TRANSCENDENTAL PHILOSOPHER OF NEW ENGLAND.

CHICAGO, August 3, 1888.

*To the Editor of THE OPEN COURT:—*

Reading in the current number of *THE OPEN COURT* Mrs. Edna D. Cheney's "Reminiscences of Mr. Alcott's Conversations," I am tempted to present you with another reminiscence of that amiable philosopher and venerable man. I once lured him into an ambuscade, and thereby defeated a conversation, if I get the name of it right. Only through the merits of a full confession can my soul be freed from its burthen of remorse, and I make the confession here. The way of it was this: I had been invited by my friend the chief justice of—Hesperia, to dine with him, and to meet Mr. Alcott, who at that time was the guest of the chief justice. A select company of a dozen or so had been invited also, and the arrangement was that we should go an hour and a half before dinner, and during that hour and a half Mr. Alcott would enlighten us with a parlor talk, or lecture. Going along the street I made a threat that greatly shocked and alarmed Mrs. Wheelbarrow; "I will smash that conversation; there shall be no feast of reason and no flow of soul before dinner; my gorge rises at it!"

"Is it not so nominated in the bond?"

"I care not; the condition is unconstitutional and void. Mr. Alcott is profound in parlor speech, but you shall hear a more effective talker ere the sun goes down."

"To whom do you refer?"

"Modesty forbids me here to speak his name."

"The sun is in the heaven, and the proud day,  
Attended with the pleasures of the world  
Is all too wanton and too full of gauds,  
To give me audience."

"But I will smash that con-ver-zat-see-o-nee. After dinner it may help digestion; before dinner it is a servant of dyspepsia."

We were all seated in the front parlor without any particular order, although Mr. Alcott's chair very properly expressed the head of the room, when the lady chief justice entered and took a seat. She was chiefier than the chief in some things, a woman not without celebrity in this land, and one much admired by Mr. Alcott. Her entrance was a sign for us to "come to attention," and while some of the company were placing their chairs, the sage made some casual remark.

"Which reminds me," I said, "of an incident that came under my own observation at the battle of Shiloh." I saw an electric spark flash in the philosopher's eyes, and I knew my hook was baited right. "We were lying down behind the rail fence, and—"

"Were you at Shiloh?" he enquired in an interested way.

"Yes, and our regiment was crouching down behind the fence; for instance, as it might be along here; while over there on the other side of the field, as it might be across the room;" and so on, describing to him the rebel yell, the answering hurrah, the charge of the gray across the farm, the repulse by the blue, the winnows of dead men reaped upon that wheatfield. The whole story heightened by a theory of my own about Sydney Johnstone's death. Whenever the fire in the story smouldered a little, the old man revived it again by a question. It had a weird fascination for him. He had never drank blood, and the flavor of it was like the fumes of wine upon his brain. I held him with my glittering eye, while he heard my loud bazzoo. The chief justice threw his right leg over the left, and then he threw his left leg over the right. He was impatient that I monopolized his principal guest, whose wisdom, and not my camp fire anecdotes, the company had been invited to hear. I affected not to notice the nervous disquiet of the chief justice.

It was like talking to a curious child; and the sage kept on trading me old lamps for new ones. He knew all about Thermopylae and Marathon, and Arbela, and Ippus, of which I knew nothing, while I knew all about Shiloh, and Corinth, and Vicksburg, of which he knew nothing; and he listened as eagerly to me as I would listen to a revived mummy telling me all about the battle of Cheronæa. Mr. Alcott knew Socrates and Plato, and Hannibal and Alexander, but Grant and Sherman were almost as mythical to him as Romulus and Remus. He dropped a remark about Xenophon which gave me a new start, and the excited philosopher listened eagerly when I began to explain that Xenophon's march to the sea, was different from that of Sherman, "because don't you see when Sherman cut loose from Atlanta,—"

The chief justice got up from his chair, and walked into the other room, and back again. I pretended not to see this bit of impatience, neither did I see it when he repeated the performance over and over again. I know it was all very wicked on my part but on I went and the more I talked to Mr. Alcott about "the battles, sieges, fortunes, that I had passed," the lower down he bent his face to listen to me and like a snow crowned venerable Desdemona, he did "with greedy ear devour up my discourse." The time passed rapidly away, and the conversation from long waiting was almost cold, but so long as he kept me spurred with questions I could not stop, neither could the chief justice prevent his venerable guest from asking them. "The charge of the French across the bridge of Lodi was not so difficult nor so dangerous as the charge of our brigade across the bridge at the—"

"Dinner's ready," said the servant. The time was up, the conversation was broken into a dozen pieces.

We all proceeded to the dining room. My place was next to Mr. Alcott; "As I was remarking, when interrupted by the announcement of dinner, "the charge of the French across the bridge of Lodi."

"There, we have had enough of that," said Mrs. Wheelbarrow, "we have come to listen to Mr. Alcott, we can hear you at any time."

"Yes," said the old man, "but I can not."

My victory was complete, and I yielded him the floor.

Very respectfully yours,

WHEELBARROW.

## THE MORAL ARGUMENT FOR GOD'S EXISTENCE.

(TWO LETTERS IN ANSWER TO MR. BARR FERREE.)

*To the Editor of THE OPEN COURT:—*

The article by Barr Ferree in No. 50, of *THE OPEN COURT*, is a typical instance of the way that men really accomplished and astute, will run into vagaries when they attempt to solve problems with insufficient and inapt data. The entire argument depends upon a set of postulates of a quality very far from axiomatic. It starts from that old pitfall, the metaphor "chain" or "series" of causes. Mathematical series are useless for any such purpose as that for which Mr. Ferree uses them. The limitation of our faculties compels us to confine our attention to a small part only of the entire complex of phenomena, and in the chain of causes and effects our selection is largely arbitrary.

It is this so largely arbitrary "chain of causes" that alone suggests and makes current the notion of an ultimate or First Cause. Causation being conceived as a linear sequence in time, we look for an antecedent extremity. (Why not also a consequent extremity?) But if this "chain of causes" is a mere figment, as it really is in spite of the fact of its convenience, and perhaps necessity in man's mental economy, what becomes of this notion of a First or Ultimate Cause? Is it not utterly dissipated? Can any analogue be suggested for substitution in its place, based on the true notion of causation? Let Mr. Ferree try

his hand in this direction. It seems to me that causation is insignificant in the theistic problem.

In early English orthography God was spelled Good. Good certainly exists, and if one is led to believe with all his heart, soul and strength, that Good is the sovereign principle of existence, that progressively and indefinitely "somehow good will be the final goal of ill," he will find his highest intellectual exercises distracted, his best aspirations balked and his will inconstant, if he denies himself the benefit of some such conception as that of God.

In defect of known law and pending its discovery or demonstration, scientific men avail themselves of those theories most apt and fruitful for their ends as working hypotheses, and have found them of indispensable use, and of the greatest value in the promotion of science. Now, considered as a working hypothesis, merely the notion of God is of the highest use. It fixes the ideas, supplies a felt need for an object for the emotions and aspirations, and tends to vigor and steadiness in the exercise of the will.

Even in the ordinary exigencies of expression, to what awkward synonyms, circumlocutions, and cumbersome, labored, and obscure make-shifts, are those driven who harbor a foolish antipathy towards the notion of a personal God. Their minds are inveterately full of ideas, proper only to an universal order, of which such a being is a constituent. They talk of the aims of Nature, the purposes of the universe, "the power, not ourselves, that makes for righteousness," and the like. How much easier and more natural to say God, his aims and purposes, his goodness, mercy and love, or even his indifference, injustice, or cruelty.

Again, does not the very possibility of Moral Science depend upon the presumption of the being of some existence analogous to a personal God, some fact exercising aim and power. Good and evil are either the arbitrary or conventional creation of man, in which case moral science is impossible, or they are expressions issuing out of the facts of the universal order. The evolution of the universal order is either fortuitous or systematic. If fortuitous, then moral science is impossible. Now, a moral science, dealing with the good and evil, manifested and suggested by a universe systematically evolving, must, in order to be a science, take account not only of all tendencies subordinate, but must project its prevision to the limits of its power, and discover some, for the time being, most general and inclusive tendency; and, furthermore, it must suppose beyond and beyond, more and still more general tendencies, although as yet inconceivable.

For such a study, the notion of an exertion exercising aim and power is absolutely indispensable. There is rigorously nothing to supply its place. If there is no aim, then the evolution of man's nature is incongruous with the evolution of the universe. There is no general aim for him to subserve. He is deluded in supposing that *ought* has any other meaning but expediency, and that expediency even has any meaning not arbitrarily imposed. The indispensable reference which alone can make morality scientific, is an ultimate aim or purpose to be subserved by conduct.

Besides, under a discipline imposed by the study of morals as a science, it is mentally and morally impossible to regard the universal order as merely mechanical, or with emotional indifference, and mental and emotional lucidity can be attained only by the supposition of an existence exercising aim and power.

Truly, as Voltaire said, if God did not exist, man would be compelled to invent him.

It is this moral necessity and convenience which constitutes the valid and ample warrant for supposing the existence of God, and there is no other warrant that can begin to compete with it.

The acceptance of God as a working hypothesis, or even as demonstrated truth, carries with it not the least implication in favor of any one of the formulated expressions of Deity.

It does not in the least prevent one who affirms, say, "My God is The Good," or "The Unknowable," or whatever else he may term it, from denouncing as an impostor Jove, or Zeus, or Allah, or Jahveh, as the adherents of this last did in times past denounce Bel and others as false gods.

Let us then, in the interest of mental and moral economy, eschew all absurd theophobia and express that which is really necessary to be named, and which we find ourselves constantly intending by its altogether most apt and useful denomination—God.

FRANCIS C. RUSSELL.

DESHLER, O., Aug. 13, 1888.

To the Editor of THE OPEN COURT:—

Allow me to say that in Mr. Barr Ferree's reasoning in No. 50, the fundamental error is the assumption of the first quantity in an infinite series ascending from a known term. This of course constitutes the series finite, and on his reasoning brings God, the infinite, within finite grasp.

If the series be infinite, "there was no beginning and can be no end," in time, or within the possibilities of our cognition. Our attempt to grasp the Absolute or "by reasoning to find out God," is necessarily vain. This the author admits when he says the first cause "is absolutely and infinitely different" from all known causes.

This error is old. Theologians speak of the absolute character of God, his eternity, immensity, etc., and then go on to speak of his moral government as a continued series of interferences with creatures,—a struggle with adverse free wills, thus nullifying all they teach or claim to teach about the being of God.

When we call the All (as I think rightly) God, we substantially declare that he is the substance, the consistency of All, the centre and source of individualities, the Unity of all. Our love and faith reaches beyond our knowledge, and we rest in the infinite power.

J. B. DUNN.

#### MAX MÜLLER'S THREE LECTURES ON "THE SCIENCE OF THOUGHT."

VINEYARD HAVEN, MASS., Aug. 3, 1888.

To the Editor of THE OPEN COURT:—

I brought the "Three Introductory Lectures on the Science of Thought" that you were so kind as to send me, along to read during vacation; I have read them with great interest. They are very suggestive, and I think his positions are generally well taken. All higher thought tends to unity, and hence to simplicity; but so far in the culture of our world it has been only the privileged few who could stand at the centres and see the one becoming the many, and the simple enlarging to the complex. Such lectures as these, however, tend to open the way of such visions, partly at least, to the many.

H. W. THOMAS.

#### THE ANÆSTHETIC REVELATION.

To the Editor of THE OPEN COURT:—

Mr. Clark is right in inferring that I have not "made the experiment with sulphuric ether." Even were there no considerations of health to prevent me from so doing, I think I should elect to remain under "some disadvantage" in this respect, since I can hardly be induced to anticipate a solution of the mystery of being from the simple method of getting drunk on gas. Neither can I see the peril of endeavoring to limit psychology within that domain of investigation specified, not by myself but by Mr. Lewes, inasmuch as no danger ought rationally to be apprehended from our limiting it thus,—that is, within the recognized boundaries of science,—and in so doing rendering it improbable that the human race will ever be so revolutionized as to exalt diseased cerebration above the normal, or, in other words, to invert and transpose the *mens sana* and the *mens insana*. While I have no desire,—as of

course I have not the power,—to compel psychologists to accept even the dicta upon which philosophers may be said to be agreed, I may add that one such dictum, (conclusion, or conviction would be the better word,) as expressed by Spencer,\* is that human intelligence is incapable of absolute knowledge." Whether Relativist or Absolutist, Gnostic or Agnostic, we ought to be able to establish our beliefs upon a rational foundation by purely rational means. The poet complains—

*Ut nemo in sese tentat descendere—nemo!*

and others besides Sir William Hamilton have used the passage against those who are apparently unwilling or unprepared to examine their own consciousness with the view of determining the nature and limits of their cognitions. It seems to me, however, that in the hyperaesthesia alluded to, the material organ whose function it is to cerebrate, or perhaps as Mr. Clark would express it, to make mental apprehensions,—is temporarily so deranged as to render uniform mental action (normal cerebation) impossible. With the utmost respect for every inquirer into the so-called mysteries of nature and of human nature, I must re-affirm that in this matter of mind-observation the appeal is "from Philip drunk to Philip sober."

Permit me a few words more with regard to Idealism, the arguments for which, as Mr. Clark says, "appear conclusive," or, as Lewes acknowledges, are incontrovertible. Briefly expressed, its thesis is that man only knows his own individuality in its subjective-objective phasis. Hylo-Idealism, however, completely reverses Berkeley's visionary position because,—as I intimated in the first letter under the above heading,—it identifies Idealism with Materialism when it proves that the highest and most abstract production of our ideation is nothing more than an expression of the ideating tissue, the *vesiculo-neurine*, the only noumenon, of which everything perceptible or conceivable by man is a creation. In the last or ultimate analysis there will be found only one entity in nature,—an entity which by virtue of its own potentiality makes for itself every idea or phase of the so-called objective, and which created alike the demon of the savage and the *Anima Mundi* of the transcendentalist.

M. C. O'BRYNE.

#### THE LOST MANUSCRIPT.†

BY GUSTAV FREYTAG.

#### CHAPTER XXII.—Continued.

The party had broken up and most of the guests had departed before the Prince gained an opportunity of speaking to Ilse without restraint.

"Just wait," thought Ilse; "you shall not escape the road."

"Have you heard from your father?" inquired the Prince, a question by which he frequently began the conversation.

"My news is not good," replied Ilse; "only think, your Highness, one of our horses has broken his leg. It was a grey which we raised ourselves, a good gentle creature, which I have often ridden, though my father did not much like my doing so. Then I must tell your Highness, the road that leads to the great market-town, to which my father every year sends his grain, is terribly bad, and the Government does nothing to improve it. For ten years the matter has been agitated, but nothing comes of it. If your Highness

could help to obtain a good road for us, I beg of you to do so; it will be a benefit to the whole district."

The Prince looked at her kindly, and said, with embarrassment:

"It is an affair of the Government, I believe my father knows nothing of it."

"I am convinced of that," replied Ilse; "the gentlemen of the Government have always reasons for doing nothing; they understand how to make difficulties, and pretend they have no money."

The Chamberlain approached, and as the conversation had taken an uncomfortable political turn, the Prince quickly retreated, bowing and smiling, with these words:

"Let us hope for the best."

Ilse, on going home, said to her husband:

"Felix, I spoke to him about the road; he is a good youth, but in society he uses only formal speeches."

Fortune would have it that some weeks after, the State Councillor, who held the chief administrative office at Rossau, came to the University, visited the Chamberlain, and was introduced by him to the Prince. He was invited to dinner, and the Prince showed uncommon interest in the condition of the district in question; he inquired about the estates in the neighborhood and their proprietors; and, at last, when standing alone by the window with the Councillor, drinking his coffee, said:

"How is it that there is no good road in the district? Could not you do something about it?"

The official duly enumerated the difficulties. At last the Prince replied:

"Yes, I know there are plenty of reasons; but I shall be obliged to you if you will give yourself the trouble of taking the matter in hand."

Much impressed with these words, the Rossau official returned home. He revolved them in his troubled mind for three days, and the more he thought of them the more important they seemed; his own future might depend upon the result. At last he came to the conclusion that an extraordinary exertion was necessary; he therefore went at once to the seat of Government and laid the whole case, and a large bundle of dusty records concerning the road, before the minister. The minister thanked him for his communication, and was also of opinion that this was an incident which it would be prudent to make known to his Most Serene Highness. When he had concluded his report on state affairs, he mentioned that in the district of Rossau complaints had been made of the bad condition of the roads, and that a strong desire had been expressed for a new road, and the Hereditary Prince had shown a lively interest in the matter. The Prince rose hastily from his seat.

\* "First Principles," Second Ed., Part I, Chap. IV, Sec. 22.

† Translation copyrighted.

"The Hereditary Prince? What does that mean? It is very satisfactory to me to find that my son takes an interest in the condition of the country," he added. "I will take the affair into consideration."

The same day a letter was written by the Prince himself to the Chamberlain, saying:

"How comes the Hereditary Prince to take an interest in the building of a new road at Rossau? I desire further information."

The Chamberlain was in great perplexity, and felt his position endangered by the secret. At last, placed in a position between father and son, he chose the path of frank disclosure to the rising sun, and acquainted the Prince with his father's question.

"You see what importance his Serene Highness attaches to the communication; the details must be imparted to him."

The Prince was equally confounded.

"It was only a word thrown out casually," he rejoined, with hesitation.

"So much the better," said the Chamberlain; "all that remains to be said is, what gave rise to your Highness's wish. It may naturally seem strange to the Prince that his subjects or magistrates should apply to your Highness instead of to him. This, so far as I know, does not seem to have been the case."

"No," replied the Prince, "I heard of it at the house of the Rector. I simply asked the Councillor about it when he was here. I wanted to be able to give an answer," he added, shrewdly.

The Chamberlain was satisfied, and in his report extolled the Professor and Ilse, at whose house it was very pleasant to visit, and he did not fail to observe that the Hereditary Prince enjoyed calling there. He was rejoiced when, a few days after, a communication was made on business by the Cabinet Secretary, and followed by a letter from the Sovereign himself, in which he expressed his great satisfaction in the conduct of the Hereditary Prince and the Chamberlain.

Ilse was equally rejoiced when her father wrote to her:

"Ilse, are you a witch? An order has been given to begin building the road immediately; the surveyor is already here to mark it out."

At dinner Ilse took the letter out of her pocket with great delight, saying:

"Read, you incredulous man, and see what our little Prince has been able to accomplish; after all we did him injustice. My poor gray excited his pity, and he wrote everything to his dear father."

The next time that Ilse met the Hereditary Prince, she began, after the first greeting, in a low voice:

"My home owes warm thanks to your Highness, who has had the kindness to exert yourself for our road."

"Is it to be built?" asked the Prince, surprised.

"Does not your Highness know it? Your intercession has induced his Grace, your father, to have it made."

"My intercession would have had little effect," continued the Prince. "No, no," he added, earnestly disowning it. "I did not write to my father. It was altogether his own decision."

Ilse remained silent: she could not understand what should prevent the son of a Prince from openly laying before his father a request on a matter of business, the fulfillment of which would be beneficial to many; that he should disown all participation in what he had evidently done, appeared to her a quite inappropriate display of modesty.

The last letter from Court had confirmed the Chamberlain in his opinion that the intimacy of the Hereditary Prince in the Rector's house was not distasteful to his father. He reflected sometimes on the reasons for this interest in persons, who were so far removed from the sphere of princely notice. He could not understand it. At all events it was his duty not to keep the Prince away from their home, and likewise to make himself agreeable to the Rector and his wife. This he did willingly and honestly, and oftentimes went to the Professor's without the Prince; he asked him to recommend books to him, showed great deference for his judgment about men, and was guided by the Professor's advice in the choice of the Prince's teachers. The energetic dignity and proud frank character of the learned man attracted the courtier, and Werner became a valuable acquaintance to him. He was also sincerely attached to Ilse, and there were times when she too could discover something of the worth and depth of heart of the Chamberlain.

But although the Chamberlain possessed all the pliancy of a courtier, and knew that the visits to the Rector's house were acceptable both to his young master and the latter's father, he showed little complaisance for the young Prince's wishes. Indeed, he was inclined to make difficulties if the Hereditary Prince, which seldom happened, would propose to join Werner's at tea; he went there with him at proper intervals, but after the road affair he avoided any greater intimacy for the Prince. On the other hand, the Chamberlain endeavored to make the Prince at home with the students, and in a way that accorded with his rank. Of the different associations which were denoted by colors, customs, and statutes, the corps of the Markomanns was then the most distinguished. It was the aristocratic club, included many sons of old families and some of the best fencers; its members wore their colored caps in the haughtiest manner, were much talked of, and not very popular.

The Chamberlain found a relative of his in this corps, and the leaders were found to possess the qualifications necessary to appreciate properly the social position of his young master.

Thus the Prince became intimate with the association, he invited the students to his apartments, sometimes joined in their lesser drinking bouts, and was agreeably introduced by them into the customs of academic life. He took fencing lessons, and, in spite of his small delicate figure, showed some aptitude for it, and the swing of the rapier in his room daily endangered the mirror and chandelier.

Ilse expressed her astonishment to her husband that the Prince, who had at first so quickly and easily opened his heart to them, had held back so cautiously since the road affair.

"Has he thought me too forward?" she asked, with vexation; "it was said with the best intentions. But I find, Felix, it is not with these great people as with us. If we once put confidence in people we feel at home with them; but they are like the birds that sing a song close to your ear, and then at once fly off and seek another resting-place far away."

"The following year they will perhaps come again," replied her husband; "any one who tries to domesticate them will be disappointed. If their airy path brings them near, you may take pleasure in them; but one should not trouble oneself about these triflers."

Nevertheless, in secret Ilse was vexed with the unfaithfulness of her little sonster.

"My duty brings me to you to-day," began the Chamberlain, on entering the Professor's room. "Among the lectures which are desired for the Hereditary Prince is one upon Heraldry. I beg of you to recommend to me a teacher who could give him a short course upon the subject. In the capital, there was no suitable person, and I confess without blushing that my knowledge is much too scanty for me to be able to impart any to the Prince."

The Professor reflected.

"Among my colleagues I know no one whom I could recommend. It is possible that Magister Knips may have knowledge of that kind. He is well informed in all these by-paths of learning; but he has grown up in a low condition of life, and his manner is highly obsequious and old-fashioned."

This old-fashioned obsequiousness did not appear any hindrance to the Chamberlain; and as he himself wished to make use of the opportunity to ascertain clearly the meaning of a mysterious figure in his own coat of arms, which looked very much like a pitchfork, but which was really a Celtic Druid's staff, he replied:

"There need not be many lectures, and I can be present myself."

Magister Knips was called, and was, as usual, at hand, and was presented to the Chamberlain. The grotesque figure appeared comical to the latter, but not at all objectionable. His modesty was undeniable; his obsequiousness could not be greater. If one could put him into a tolerable coat, he might, for a temporary object, be allowed to sit at the same table with the Hereditary Prince and the Chamberlain. So the Chamberlain asked whether Master Knips could undertake to give some lectures upon heraldry.

"If the gracious and noble gentleman might be content perchance with German and French emblazonry, I believe I may venture to offer him my undoubtedly unsatisfactory knowledge. But of English coats of arms and figures my knowledge is not extensive, because of lack of opportunity. I would, however, endeavor to give some information upon the new investigations concerning the Honorable Ordinary."

"That will not be necessary," replied the Chamberlain; and, turning to the Professor, he said: "Will you allow me to arrange details with Master Knips?"

The Professor left them to transact the business, and the Chamberlain continued, more freely:

"I will, trusting to the recommendation of the Rector, endeavor to ascertain whether the Hereditary Prince can avail himself of your instruction and derive the proper advantages therefrom."

Knips bowed lower and lower, until he almost disappeared into the ground; but his head was reverently bent towards the eye of the Chamberlain. The latter mentioned a liberal sum as the price of the lessons. Knips smiled, and his eyes twinkled.

"I must further request, Master Knips, that you will not object to assume a becoming appearance for the intended lectures. A black coat, and trousers to match."

"I have them," replied Knips, raising his voice.

"White waistcoat and white cravat," continued the Chamberlain.

"I have those likewise," warbled Knips.

The Chamberlain considered it preferable to ascertain, by his own inspection, the capabilities of the candidate in this respect.

"Then I beg of you to make your appearance at the apartments of the Hereditary Prince in fitting guise. There we will confer upon details."

Knips appeared the following morning in his state dress, and the Chamberlain thought that the man did not look so bad after all. He gave him to understand that a learned discussion was not required, but rather a rapid survey, and, on his departure, presented to him a bottle of perfume, for his white pocket-hankerchief, in order to consecrate Knips' atmosphere.

(To be continued.)

## NOTES.

Mr. Moncre D. Conway contributes to THE OPEN COURT, a timely essay on "The Founding of our Religious Freedom," the first part of which appears in this number. The subject has never been thoroughly treated, and Mr. Conway has used unpublished manuscripts and original researches mainly.

The personal and social traits of "The Modern Greeks," will be described in *Scribner's* for September, by Prof. Thomas D. Seymour, of Yale College, whose companion article on "Life and Travel in Modern Greece," in the June number of this Magazine will be recalled. F. D. Millet and Kenyon have made illustrations.

Mr. Cortlandt Palmer, of New York, a free-thinker, founder and president of the Nineteenth Century Club, sent, two days before his death, the following message to a friend: "The world has been for me my country; to do good, my religion; and I suffer no fear in the presence of what Christians generally look upon as the king of terrors."

The new Chicago Journal *America* is devoted to the work of preserving especially American institutions. All Americans, natives as well as naturalized citizens, will heartily sympathize with these endeavors. One of the most essential features of the true American spirit is its broad humanitarianism; it is the cornerstone upon which this republic is founded, and all our hope of the future greatness of this country depends on it. While the many dangers of immigration (especially of the ignorant classes) must be acknowledged, our new contemporary would enlarge the field of its usefulness if it would take its stand on the broad American principles of our ancestors instead of limiting patriotism to nativism.

## GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are determined by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

## E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."

## W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. *Katzenjammer* is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to *Katzenjammer*. *Katzenjammer* was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a *Katzenjammer*-band was that of Cataline! What *Katzenjammer* was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fluke. Price, 5 cents; 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$5.00.  
Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$2.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis C. James. Price, 10 cents.  
Social Ideals. By David A. Wasson. Price, 10 cents.  
The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Grumbine. Price, 15 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## Recent Contributions to "The Open Court."

THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET.....In Nos. 49, 50 and 51.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfin'd in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays will be published at the conclusion of the series.

The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

Mrs. EDNAH D. CHENEY...In Nos. 49 and 50.

In Nos. 49 and 50 THE OPEN COURT publishes a paper upon Mr. Alcott's conversations, read by Mrs. Ednah D. Cheney before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1840. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

## THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

## REFLEX MOTIONS.

G. H. SCHNEIDER.....In No. 54.

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

YOU SHOULD READ

## AMERICA.

WHY?

Because it is the only paper in America that advocates *American rule* in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson,  
Sen. Teller, Sen. Mitchell, Sen. Dawes,  
Sen. Stewart, Hon. Theodore Roosevelt,  
Seth Low, Hon. Andrew D. White,  
Ella Wheeler Wilcox, Bishop Cox,  
Hon. James Russell Lowell, Admiral Porter,  
Charles Dudley Warner, James Whitcomb Riley,  
Frank R. Stockton, Edgar Fawcett,  
J. T. Trowbridge, Edgar Saltus, Robert Grant,  
Julian Hawthorne, W. Clark Russell,  
and scores of others equally famous.

Because you can subscribe one year for \$3.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts.; and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

## THE FOUNDING OF OUR RELIGIOUS FREEDOM.

BY MONCURE D. CONWAY.

(Concluded.)

When the Virginia Bill of Rights was passed, Williamsburg paraded and fired all its cannon. But nobody supposed that the declaration of religious freedom had any more bearing on the established church, than its declaration, "that all men are by nature equally free and independent," meant negro emancipation. Patrick Henry, in offering the clause, disclaimed any intention of attacking the establishment; and the convention, equally unconscious of what it had done, proceeded to substitute "Commonwealth" for "King" in the prayer-book. Though in the autumn of that year (1776), the Virginia Assembly suspended the tax in support of the clergy, it was to be some years before the full bearings of the principle adopted could be realized. A commission, consisting of Jefferson, Pendleton, Wythe, George Mason, and Thomas Ludwell Lee, engaged (1777-79) in revising the laws of Virginia, reported the famous statute, his authorship of which appeared to Jefferson a nobler claim to mention on his tomb than the official honors he carefully omitted. "No man shall be compelled to frequent or support any religious worship, place, or ministry whatever, nor shall suffer on account of his religious opinions or belief. Opinion in matters of religion shall in nowise diminish, or enlarge, or effect civil capacities. And though we well know that this Assembly, elected by the people for the ordinary purposes of legislation only, have no power to restrain the acts of succeeding assemblies, constituted with powers equal to their own, and that, therefore, to declare this act to be irrevocable, would be of no effect in law; yet we are free to declare, and do declare, that the rights hereby asserted are of the natural rights of mankind, and that if any act shall be hereafter passed to repeal the present, or to narrow its operation, such act will be an infringement of natural right."

This statute, as Bancroft says, was translated into foreign languages and widely circulated in Europe, and "a part of the work of the noble army of martyrs was done." But it was not quite done in Virginia. The revised code was indefinitely postponed for popular discussion, and, meanwhile, a reaction set in. On May 15th, 1783, Edmund Randolph, writes Madison

from Williamsburg: "Religion, which has hitherto been treated with little respect by the Assembly, was yesterday incorporated into their proceedings. Mr. Hay moved for a chaplain, and that a prayer should be composed adapted to all persuasions. The prayer has not been reported, though several trials, I am told, have been made." This was a symptom. Petitions had begun to come on the Assembly, alleging a decline of morals, and attributing it to the neglect of religion, for which some provision was demanded. In 1784, a standing committee reported on these memorials, and in pursuance of their recommendation, a bill was introduced for a general assessment of the people for the support of religious teachers, each individual stating to what denomination his tax should go. To this measure Patrick Henry gave enthusiastic support. Even the Presbyterians supported it. "They seem," wrote Madison to Monroe, "as ready to set up an establishment which is to take them in, as they were to pull down that which shut them out. I do not know a more shameful contrast than might be found between their memorials on the latter and the former occasion." Madison was now a member of the Virginia Assembly. The utmost he could do (1785), was to secure a postponement until the constituencies could be heard from. He then prepared his powerful "Memorial and Remonstrance," which was scattered through the State for signatures. During the interval, Madison wrestled with the Presbyterian ministers, while his friend, Edmund Randolph (Attorney of the State), did the like with the Episcopal clergy, who had at first been pleased with the scheme. Randolph writes to Madison (July 17th, 1785), "I dedicate to you, as the patron of the Protestant Episcopal Church, the enclosed journal. Between friends, my experience in the last (Episcopal) convention does not make me anxious to step forward in another. We have squeezed a little liberality from them, but at a future day they will be harder than adamant, and perhaps credulous that they have authority." When the day of battle arrived, Patrick Henry had left the Assembly for the gubernatorial chair. Washington—at first wavering—had expressed hope that the Bill would die an easy death; and George Mason, with Madison, stood beside a table groaning under the signed remonstrances prepared for a combat never to be offered.

It was not even offered when the occasion was improved to take up the Jefferson statute, lying on the table since 1779, which was then made law.

In this contest, Madison and the State Attorney were one, but on a related question their views diverged. In 1784, the Assembly had granted petitions of the Presbyterians and Episcopalians for incorporation of their respective denominations, the same being offered all denominations. The Episcopal Church alone availed itself of the grant, which enabled it to own its glebes. A bill for incorporating this church was brought in by Patrick Henry, who thereby lost popularity among the Baptists. After elimination of some ecclesiastical survivals from the bill, Madison voted for it; but he only meant it as a nail to drive out a rustier one—the Assessment—and, this being removed, addressed himself to the work of repealing the Episcopal incorporation. Concerning this, the State Attorney (Randolph) wrote to Arthur Lee: "I cannot but consider the act of incorporation in the light of a compact which legislative authority may dissolve by the arm of power, but not by the rules of justice and honor." Madison now advocated the repeal on the ground that incorporation recognized the principle of legislative interference with religion, but admitted that each sect should be secured in its possessions, and this proviso was embodied in the repealing act, (January, 1786). This settlement was, however, assailed. In 1789, when Randolph was engaged on his revision of the Virginia Code, which delayed entrance on his duties as Attorney General of the United States, he writes to Washington, (November 22): "In a day or two we shall be agitated by a question on the sale of the glebes. The partisans of this iniquity wish to keep it off until next year; but it is determined to prepare an antidote to their misrepresentations by stating the title of the church in a pointed manner." It was not until 1802, (three years after repeal of all post-revolutionary laws on church property,) that the glebes were confiscated and ordered to be sold. But this act has been declared unconstitutional by the Supreme Court. (*Terrett v. Taylor*. 9 Cranch, 53.)

Most of the Virginians who sat in the Constitutional Convention of 1787, had been members of the Virginia Convention of 1776. They had therein toiled through some weeks before they could secure adoption of the first clause of Mason's Bill of Rights, that "all men are created equally free and independent." With such an experience, Governor Randolph was little inclined to risk entanglement of the Philadelphia assembly among generalities; and indeed such "display of theory," as he phrases it, "however proper in the first formation of State governments, is unfit here." His idea of a federal constitution, written to Madison as early as March 7, 1783, was "a compact in which

the people themselves are the sole parties, and which they alone can abrogate, delineating the degree to which they have parted with legislative, executive, and judiciary power, as well as prescribing how far each of the simple forms of government is to be pursued in acts of legislation." In harmony with this, his draft of a constitution, recently discovered, contains no allusion to religion. No power could ever be claimed on a matter not even mentioned. Religion had not been ignored, however; and it was due to Randolph's vigilance that the double-edged clause in Art. VI, against religious tests for office, did not injure the freedom it meant to secure. On Feb. 29, 1788, he wrote to Madison: "Does not the exception as to a religious test imply that the Congress, by the general words, has power over religion?" This led to an agreement between the two that religious liberty needed further security, which was urged in the twentieth amendment sent up by Virginia along with its ratification: "That religion, or the duty men owe to our Creator, and the manner of discharging it, can be directed only by reason and conviction, not by force or violence, and therefore all men have an equal natural and inalienable right to the free exercise of religion, according to the dictates of conscience, and that no religious sect or society ought to be favored or established by law." There were implications here also. The words closely resemble Patrick Henry's proposed addition to the Bill of Rights, already quoted, and perhaps were meant to conciliate him to the new constitution; but they were modified by the same hands that modified the Henry article fifteen years before, Madison and Jefferson, and, in combination with the sixteenth Virginia amendment securing freedom of the press and speech, were established in the first article added to the constitution.

The part performed by Jefferson in the founding of our religious freedom, was different from that sometimes attributed to him, especially by those who regard that freedom as representing the free-thinking tendencies of the time. The hand of Jefferson may be recognized in the Virginia statute of 1786, and in the first constitutional amendment, giving a liberty free from phraseology which might be construed into limitation. It may be that only an unorthodox eye could have detected the points at which a freedom primarily aimed at pretensions of a particular church, might yet be inadequate to include the freethinker. It is also certain that Jefferson was consulted as an unorthodox man, he and others, and that Randolph, Madison, and Mason, deliberately enlarged their phrases to include every variety of denial as well as belief. But the foundations of our religious freedom were laid in the Virginia Convention of 1776 by devout and orthodox members of the English Church.

That church was disestablished by its own vestrymen. It is true also that the leaders in the work, Madison and Henry, had been brought under especial Presbyterian influence, which, while kindling their religious spirit, yet did not draw them from the old church. Madison, Randolph, Mason, Washington, and others, having disestablished their own church, prevented Presbyterianism from establishing another of pandenominational character. Jefferson's statute lay on the table seven years, and was then made law by Madison and Mason, assisted by the devoutest Episcopalian and Presbyterian ministers whom they had fairly converted. It is certain, therefore, that religious freedom was founded by religious men, though that foundation was afterwards broadened to secure perfect equality between the believer and unbeliever. Among these founders, who knew well what they builded, was George Washington. To George Mason, his friend and neighbor, in conjunction with whom he built a church, Washington said: "No man's sentiments are more opposed than mine to any kind of restraint upon religious principles."

The words were meant to be quoted in the Assembly for the purpose of defeating the proposal for a general assessment for support of religious teachers, and were so quoted; they helped to enact in place of that scheme the statute prepared by Washington's first Secretary of State—Thomas Jefferson. What the religious freedom and equality incorporated in the constitution implied in the mind of Washington, has been seen in the article from the Tripoli Treaty already quoted. The skeptical Jefferson was not so bold as his orthodox predecessor, and when he renewed the treaty, in 1805, the broad assertion of the non-Christian character of this government was omitted. The treaty ran: "As the Government of the United States of America has in itself no character of enmity against the law, religion, or tranquility of Mussulmans, etc." The omission may, indeed, have been due to Tobias Lear, who drew up the treaty, but it is equally probable that Jefferson dreaded an increase of the reactionary feeling which had been exasperated by the writings of Thomas Paine. Jefferson's affirmative creed being established in the religious liberty of the Virginia and the Federal Constitutions, verbal expression of his negative views, appeared to him of little importance compared with the monument of catholicity he aimed to give his State, to be a model for the nation. This was to be an educational system, free from any and all religious bias, which should diffuse the knowledge by which truth would alone be elicited. For this end he worked with men of orthodox creed and catholic spirit, with Madison, Marshall, and others,—and at length his creedless University was established. By significant coinci-

dence it was first planted on an old church glebe. It was achieved amid menaces of jealous sectarianism. An early invasion of typhoid among the students drew down a solemn episcopal warning on the non-Christian institution. From time to time it is even now charged that Jefferson established the University to propagate infidel opinions. Nothing could be more untrue. Jefferson was extremely anxious to secure the university from all such strife. I have just copied from its library catalogue, written with his own hand, these words: "In Religion, divided as it is into multifarious creeds, differing in their basis and more or less in their superstructure, such moral works have been chiefly selected as may be approved by all, omitting what is controversial and mainly sectarian." One looks in vain for the deistic works of Paine and other polemical writers. Nor were Jefferson's opinions such as would now be called "infidel." Although from the time of his graduation at William and Mary until his refusal on his death-bed to receive the clergyman "except as a good neighbor," he was never orthodox, he had a religious spirit, and the reverence for Christ which led him to make the book preserved by his descendants at Edghill: "The Life and Morals of Jesus of Nazareth extracted textually from the Gospels in Greek, Latin, French, and English."

Those reactionary zealots who desire to "put God in the Constitution," are assailing an edifice founded by their own orthodox ancestors. Not much, indeed, is to be feared from them. The more formidable enemy is the insidious usurpation which, in contravention of the very constitutional letter has "established" such religious institutions as Sabbath, Chaplaincy, and the Thanksgiving day. Behind these encroachments is a pious party which reads its prepossessions into the constitution as easily as into the Bible. An offender in this direction has just appeared in Dr. Philip Schaff ("Church and State in the United States": 1888). In quoting Washington's statement that our Government "is not in any sense founded on the Christian religion," he omits the pregnant words "in any sense." He quotes Washington as having favored religious assessment, though Washington disdained it. He says, that the constitution, in requiring an official oath, recognizes "the Supreme Being, to whom the oath is a solemn appeal." The constitutional alternative of affirmation is here omitted; also the care with which divine sanction is omitted from the special oath of the President. The reader is left on one page to infer that the use of the Bible, in the oath, is constitutional. Dr. Schaff's interpretations of law are often erroneous. He claims that the anti-polygamy decision of the Supreme Court (*Reynolds v. the United States*) would exclude from toleration "the public exercise of Mohammedanism which sanc-

tions polygamy." It is not the sanction but the practice of polygamy which is prohibited.

Let me mention in conclusion, that the most important statement of the legal relations of religion in this country, will be found in a volume published in Cincinnati, in 1870, entitled: "The Bible in the Public Schools." In it are exhaustive arguments delivered before the Superior Court by Stallo, Hoadly, and Matthews (now of the Supreme Court). The judicial opinions are also of the highest importance. It is a pity that the pith of that volume is not published in a convenient form; for the friend of religious freedom will find in it much ammunition to defend the faith delivered from our free and brave political fathers.

#### THE PROBLEM OF DOUBLE PERSONALITY.

The late Mr. Edmund Gurney, one of the founders of the Society for Psychical Research, in England, has been praised as one of the most "careful investigators and sifters of the evidence of unusual phenomena." His papers on the many problems of the soul have been, perhaps, the most valuable contributions to the Proceedings of the Society for Psychical Research, showing "the utmost anxiety to state fully all those facts, which bore unfavorably on the reality of the phenomena which he was investigating, and to attenuate, instead of enhancing, the marvel of the elements involved." The descriptions of his experiments, therefore, possess value also to those who do not accept his explanations and theories. We here present a number of experiments of "intelligent automatism" as described mainly in Mr. Gurney's own words by *The Spectator*, of June 30, 1888:

"Mr. G. A. Smith, the 'hypnotiser,' sent off one of the patients into a mesmeric sleep, and in this sleep the patient was told that he was to write some particular word, or to count the number of *e's* in a particular verse, or to do a particular multiplication sum when he awoke. \* \* Then he was awakened and at once engaged in reading aloud, or counting backwards, or doing something that engrossed his full attention; but his right hand was placed on the planchette (an instrument on wheels containing a pencil), the paper and planchette being always concealed from the subject's eyes, so that he could not know, unless he were able to guess from the blind movements of the instrument under his hand (which guessing was made very difficult by the occupation found for him), what letters or figures (if any) the instrument was tracing. 'As a rule, he was always offered a sovereign to say what the writing was, but the reward was never gained.' On being sent back into the mesmeric sleep, he recalled the whole process, though in the waking state he could never tell what the movements of the planchette under his hand were engaged in producing. Here is Mr. Gurney's account of the results as regards the arithmetical sums worked by what he calls the 'secondary intelligence':—

"The sums given were simple, as most of the 'subjects' were inept at mental arithmetic. There were 131 sums in which three figures had to be multiplied by a single one; of these 52 were quite right, 28 had three figures in the answer right, 18 had two figures right, and 14 had one figure right only, whilst 12 were quite wrong, and 7 were either so illegible and muddled as to be unde-

cipherable, or only a small stroke or curve was made at all. \* \* In some cases the sum itself was correctly written, but no attempt was made to put the answer. \* \* A few sums of other kinds were also given: of 14 simple addition (of about the following difficulty:  $4 + 7 + 9 + 11 + 13$ ), six were done correctly, two were quite wrong, and the remaining six were either not done at all, or the answers were illegible scribbles. \* \* Another case illustrates the very distinct memory, on re-hypnotisation, of what had been written. Wells was told to work out the sum, '13 loaves at 5d. each,' and instantly woke as usual. He wrote, '13 loaf at 5d. is 5s. 5d.' When hypnotised again, and asked to say what he had written, he replied, '13 loaf—oh, I've put *loaf* instead of *loaves*—at 5d. is 5s. 5d. I've written the 13 twice—see—but I crossed it out.' He then proceeded, by a long roundabout process, to work the problem out, arriving at the correct answer again.

"Another form of experiment was to tell the 'subject' to count the number of times a certain letter occurred in a given verse. Thus, Wells was told to write down the number of times the letter *E* occurred in the verse—'Mary had a little lamb, etc.,' and then, after saying the verse once quickly through to show that he knew it, he was instantly awakened and given *Tit-Bits* to read. Whilst thus engaged he wrote, *The letter E comes 11 times*—which is right. The same experiment was tried with Parsons, who also was kept occupied by being set to read immediately upon waking; but he was not so accurate, and wrote down '12.' He was completely successful, however, when told to write the number of *E's* in

God save our gracious Queen,  
Long live our noble Queen,  
God save the Queen.'

and wrote 11, having read excellently the whole time."

Concerning Mr. Gurney's explanation of these facts, *The Spectator* adds:

"His inference is that these trances induced by mesmerism, or whatever we like to call the peculiar influence which special persons seem to possess of rendering others unconscious,—separates the mind of the patient into two separate planes of consciousness, each of which is capable of accomplishing such simple intellectual tasks as the subject's education has fitted him to perform, but nevertheless without the privacy of the other, so that the man is apparently subdivided into two men, one of whom is reading aloud, and the other working a sum or counting the number of *e's* in a stanza, though the man who is doing the sum has little or no knowledge of what his *alter ego* is reading aloud; while the man who is reading aloud has no knowledge at all of the operations of the *alter ego* who is doing the sum."

The facts fully agree with the investigations of the French school of experimental psychology. Th. Ribot's view of double consciousness has been explained in No. 13 of *THE OPEN COURT*, page 346, as follows:

"The *ego* is no distinct entity of conscious states. Such an hypothesis is useless and contradictory; it is a conception worthy of a Psychology in its infancy. Contemporary science sees in conscious personality a compound resultant of very complex states. The mechanism of consciousness is comparable to that of vision. Here we have a visual point in which alone perception is clear and precise; about it is the visual field in which perception is progressively less clear and precise as we advance from center to circumference. The *ego*, the present of which is perpetually renewed, is for the most part nourished by the memory. Beneath the unstable compound phenomenon of consciousness in all its Protean phases of growth, consumption, and reproduction, there is a something that remains, and this something is the obscure consciousness which is the product of all the vital processes, constituting bodily percep-

tion, and which is expressed in one word, *cansthesis* (Germans call it 'Gemeingefühl'). The unity of the Ego is not that of a mathematical point, but that of a very complicated mechanism; it is a consensus of vital processes, co-ordinated by the nervous system and by consciousness the natural form of which is unity."

It is well known that most organs of our body work automatically without the slightest interference of, or accompaniment by, consciousness. It is a fact also, that many, nay most, processes of our brain take place with the same automatism and regularity as the beating of our heart, and (as Mr. Ribot says) "consciousness is the narrow gate through which a very small part of all this work makes its appearance."

Mr. Gurney's experiments, far from proving that the soul is a mysterious entity, tend only to strengthen Mr. Ribot's and his co-workers' position. It is not the *ego* which stands behind the scene and creates our ideas, like an operator working on the mechanism of brain-cells; but our ideas being living brain structures enter as it were into consciousness and produce the *ego*. They may be at work without being connected with consciousness, in which, so to say, our feelings are focused. In the hypnotic state (which is an obliteration of consciousness), it appears that another centre of brain activity is created which stands in no connection with the consciousness of the waking individual. Thus a second *ego* is produced, to which the first *ego* is not privy, and we have the strange incident that two personalities exist in one and the same person. The second *ego* takes precedence in the hypnotic state, when the first *ego* is paralyzed by sleep. In the waking state the second *ego* disappears, but it does not cease to exist. Mr. Gurney shows that even then its activity, as well as its memory, continues. Although unconscious with reference to the first *ego*, it must be conscious with reference to the second *ego*.

Consciousness and unconsciousness, it appears, are merely relative. Sometimes long chains of most complicated thought are unconscious, and their results only flash up in consciousness like a divine inspiration. Poets, inventors, mathematicians, and other thinkers have often occasion to experience this, and Lichtenberg is right when saying: "We should say, 'It thinks,' just as well as 'it lightens,' or 'it rains.'" This idea, fully understood, solves many psychological problems and accounts also for the odd facts presented in Mr. Gurney's experiments. 'It' thinks in the subjects experimented upon. 'It' thinks here and there, and in many other places of their brains. By his excellent method, Mr. Gurney succeeds in making a part of this latent thinking appear, without letting it enter into consciousness, *i. e.* the consciousness of the first *ego*.\*

P. C.

## MONISM AND RELIGION.

A REJOINDER. BY D. THEOPHILUS.

*With Editorial Remarks.\**

The article submitted by me as a criticism of THE OPEN COURT's method of conciliating religion with science, and which was published in No. 30 of the journal, has since been honored with two able replies: the one from the editor, and the other from Mr. E. P. Powell. Both written in defense of the view I combated; otherwise differing widely from one another as regards the method of defense, as well as the grounds whereon the alleged harmony is based.

Dr. Carus in his preliminary remarks intimates that the view put forth by me cannot be a final one; that it is rather the expression of a mind in a transition stage of development. He pays me the compliment of telling me that he himself had once been in that stage; but that a further study and research had enabled him to pass through to the position he at present occupies.

It is to be regretted, that he did not give us the facts or the arguments that prevailed with him and were influential in giving that particular direction to his mental growth. Had we been furnished with such an item, it might have been a valuable acquisition—a means of carrying conviction to others. In its absence, the bare mention of the fact itself can scarcely possess such efficacy. For that particular way of development is far from uniform. No one knows better than Dr. Carus that the mental growth of some of the greatest minds in history has taken the reverse order of the one he gives as his own. Their transition stage being his final, and his final, or at least something similar, had been their transition period. To limit myself to but few instances, that was the order of growth of such minds as those of Feuerbach, Strauss, and Ueberweg, in his own native country; and those of the two Mills, G. H. Lewes, George Elliot, and Clifford, in my own. No one need be ashamed of being found in company with such men as these.

[The mental growth of most minds has been from authoritative belief through doubt and unbelief to a rational faith, from religious superstition through a radical denial of religious truth to the religion of humanity, from supernaturalism through skepticism and agnosticism to positivism. Strauss has written *The Life of Jesus*, a radical criticism of the gospels and some time after the publication of this work he wrote *The Old and the New Faith*. Feuerbach has made similar efforts to create a new faith, based on altruism (*Liebe*), in the place of that untenable creed which he had torn down, because it rested on superstition. Ueberweg's chief work does not prove that he went so far as to openly oppose religion. I doubt whether he did it at all. He is known to me as a scholar only who has written a history of philosophy with scientific objectivity and impartiality.

[The life work of Mr. Clifford and George Elliot has been in another line. Clifford was a physicist, and moreover he died extremely young; his career, however brilliant, was so short that we can scarcely refer to a development of his views. George Elliot most decidedly suggests in her novels that a new faith has to take the place of the old creeds. Mr. Lewes, it is to be presumed, did not disagree with his wife on this point. The two Mills did not go so far as to point out the possibility of a new and truer religion. But what of that? They did not concern themselves with such an idea. They might have done so. And one of their followers, Mr. Herbert Spencer, has made an attempt to propound a philosophic religion in his *First Principles*.

[The signs of the time indicate that the development of humanity is pressing forward in that direction.

\*We again take occasion to mention the excellent work by MM. A. Binet and Ch. Féré on *Animal Magnetism*, a translation of which has appeared in the International Science Series (Appleton & Co., New York, 1885).

\*Lack of space prevents us from writing an editorial article in answer to this Rejoinder. The necessary replications, for the sake of saving space, will appear as parenthetical insertions marked by hanging indentations.

[The motive of Strauss, Fuerbach, Comte, *et al.*, for abandoning the desert of mere unbelief and creating (or at least for attempting to create) a new and rational faith has been (and so it was with me) the natural desire of man to have a harmonious conception of the world as a guiding star in life.

[Goethe had the same experience when he had lost the faith of his childhood. But he had strength enough to restore the lost harmony. The breakdown of the old form of belief must be a transition to a better belief, to the belief in the possibility of progress, and to the confidence in the victory of the good, and to the faith in humanity and the advancement of humanity. When Faust, having lost his hold in life, curses Hope, Faith, and Patience, the choir of spirits sings:

Woe! Woe!	Mightier
Thou hast destroyed it,	For the children of men,
The beautiful world,	Brighter
With powerful fist;	Build it again,
In ruin 'tis hurled,	In thine own bosom build it anew!
By the blow of a demi-god shattered!	Bid the new career
The scattered	Commence,
Fragments into the Void we carry,	With clearer sense,
Deploring	And new songs of cheer
The beauty perished beyond restoring.	Be sung thereto!

[Dr. H. Druskowitz, in her pamphlet *Moderne Vertuete eines Religionsersatzes*, enumerates the most important efforts which have been made in this direction. She discussed the views of several modern thinkers and gives most prominence to August Comte, Eugen Dühring, W. Salter, and August Nitsche. The authoress herself and all these men are known as unflinchingly radical, and yet they leave the barren shores of negation and make earnest attempts to build a better religion in the place of the relinquished creeds, so as to preserve what is good and true in them.—Ed.]

Having given us a slight touch of that unconvincing, yet popular style of reasoning, consisting of an appeal to prejudices,\* a species of reasoning known to the Logicians as *argumentum ab invidia ductum*, Dr. Carus proceeds to discuss the subject-matter of the essay itself. He says, "The leading mistake of Theophilus is that he criticises religion as he defines it, not as it is defined in THE OPEN COURT." To this charge I can hardly plead guilty. For the larger portion of the article was devoted to the task of showing the inadequacy of the definition of THE OPEN COURT. That in strictness it was no definition of religion at all, though it might be a correct definition of metaphysical philosophy. I wish Dr. Carus had distinctly stated how does religion as conceived by him manifest itself. Is it a thing of the intellect, or of the feeling, or both, and wherein does it differ from science and ethics? [A definition of religion has been repeatedly given in THE OPEN COURT.

[The basis of Religion is man's relation to the All. The man who is aware of his dependence upon the whole of existence, who feels himself as a representative of the order of the world and who knows that he has to conform to the laws of the cosmos and intends to do so, is religious. We may repeat here the expression used above: Religion is a conception of the world that serves as a guiding star through life.

[Religion (in this sense) is the basis of Ethics. Ethics (which is the science of morals) instructs us about the proper conduct of man. He who conforms consciously and from principle to the laws of the All, is moral. We purposely say 'consciously and from principle,' for an animal may conform to the laws of the cosmos from instinct; an animal cannot properly be called moral. Only a rational being can be moral in the highest sense of the word.

[Science investigates the laws of the Universe; science is systematized knowledge, based on methodical observation and consistent reasoning; its method being economy of thought. Science is a matter of reasoning and understanding. Religion is not exclusively cognitive, it takes the whole man, his head and his heart, his intellect and his feeling. Without any knowledge of the most important cosmical laws, religion will become superstition; and without character, without good-will, and without devotion, religion is hypocrisy.

[It must be repeated here that 'Mr. Theophilus did not criticise religion as defined by THE OPEN COURT.' He showed only, as he confesses now, 'the inadequacy of the definition of THE OPEN COURT, which 'in strictness is no definition of religion at all,' in other words, of religion as defined by Mr. Theophilus.—Ed.]

To what he calls my definition of religion, the editor raises the objection that it excludes Buddhism, which is an atheistical religion, "whose adherents are the most numerous on earth." At first sight this appears a very fatal objection. It is an objection, however, that I had fully in mind while fixing the limits of religion in the former article. In reply I would remark that Buddhism, as promulgated and practiced by Gautama himself and his first disciples, was no religion at all in the strict sense. It lacked the distinctive mark whereby religion has been known in the world. He himself was simply a social reformer, and the society established by him was merely a sort of brotherhood—a union of men of like sympathies for mutual aid; a society similar in character to the Pythagorean brotherhood in ancient time, or the Guilds in the Middle Ages, or the various orders of the present day. And I should go further and say that the society founded by Jesus was of a like character. Both Buddha and Jesus were strictly social reformers: neither taught nor intended to teach a new religion. In so far as the latter was concerned, each was satisfied with the form already in vogue in his own country.

In course of time both developed into genuine forms of religion. The founders of the societies are no mere mortals any longer. Henceforth their persons are idealized, their names sacred, and their origin shrouded with mystery. Their doctrines are invested with infallibility and authority, and their precepts become commands which no one, with impunity, can violate or disregard. Allegiance to the person thus transformed is now the badge of the society: and the same has always constituted the distinctive mark of religion. Buddhism thus metamorphosed, is doubtless a religion, and as such is not excluded by the proposed definition.

[Mr. Theophilus is consistent as to his definition of religion when he states that the religions of Jesus and Buddha were no religions, but that the degenerated types of Christianity and Buddhism were. According to our view, Christ's ethical doctrines contain more religion than all the dogmas of Christianity. The question remains, which definition is more legitimate, and which shall we consider as the essential feature of religion the truth contained in it, or its errors?—Ed.]

Disregarding minor differences and side issues, let me here briefly indicate wherein lie the essential points of difference between the editor and myself. With his philosophy I have no quarrel. On the contrary, I believe the monistic conception of the world is the only view consistent with scientific knowledge. And his position as defender of that philosophy, I regard as altogether impregnable. But when he proceeds to build up a religious faith and practice upon the monistic philosophy as basis, he seems to be undertaking an impossible task, without at the same time doing violence to the principles of that philosophy.

[The religion of monism is the simple consequence of a monistic philosophy. It does not do violence to its principles but is practical result.

\* No defense shall be made against insinuations, that my argument consisted of "an appeal to prejudices."

[The main difference between philosophy and religion is that philosophy is for the few, religion is for the masses; philosophy is for the thinker alone, religion is for everybody; philosophy is esoteric, religion is exoteric. If the principles of philosophy can be presented so clearly and in terms so simple as to be accessible to the many, this philosophy can become a religion. Whether this is possible with regard to the philosophy of monism remains to be seen. The efforts of THE OPEN COURT are the first practical attempts in this line and our readers are enabled to judge themselves of the feasibility of our idea.—Ed.]

My contention is that there is involved in religion a recognition of a personality claiming allegiance or worship at the hands of its devotees. There is always implied in it the idea of a personal relationship. All forms of religion hitherto known in history, have exhibited this indispensable feature, as their very core, essence, and life.

The monistic conception furnishes no data for the realization of such relationship, and none, therefore, for the existence of religion; that is to say, religion such as the world, under that familiar symbolic name, has universally recognized.

[One of the chief errors of dualistic religion is its anthropomorphism. The dualistic god is a person like a human being, and according to the dualistic conception, the personality of God is the cornerstone of all religion. This had been repeated so often that even their adversaries believed it. And it is this belief of which Mr. Theophilus is unable to free himself. When in former times the prince considered himself as the state (*l'état c'est moi*), a republic or a State without a prince was declared to be an illogical fiction; allegiance except to a prince, it was assumed, could as little exist as a religion without a supernatural and personal God. Even the enemies of princes at length believed in this logic, and declared: let us have no State at all, no law or social regulation, for republics are a sham, they are monarchies disguised and true liberty means anarchism.]

[In opposition to such views, THE OPEN COURT declares, that just as true patriotism and faithful allegiance to one's country are purer in a republic than in a monarchy, so religion will be higher and more elevated, if it is freed from those superstitious elements which have been wrongly considered as 'the very core, essence and life of religion.' The adversaries of the orthodox are not as yet impartial enough to see that there is a deeper meaning in religion than both parties (believers and unbelievers) are aware of.—Ed.]

To the monistic thinker, such a personality as religion postulates, is wanting; and as a necessary consequence from this fact, he at the same time discovers that the feeling of allegiance or religious emotion has died out in the heart. The latter can only arise when the intellect has found an appropriate object for its exercise. Take away that object and the feeling instantly collapses.

Such, it seems to me, is the issue deducible from the monistic philosophy. That philosophy has undermined the foundation of religion, both in external nature and in human consciousness, both as a knowledge and as a sentiment. So that there is no longer room for it either in the intellect or in the heart. It has been ousted from both positions by the simple operation of the law of development, and no other force whatever.

The religious idea, like many other products of human consciousness, did discharge once a useful and necessary function in man's intellectual and moral life, but at a certain point in his growth, he may find it of no use to him. There is no longer within consciousness any function for it to discharge; and so as an inevitable consequence, it perishes, precisely as is the case in the organic world.

It should be remembered that there is a struggle for existence

going on within as well as without; in human consciousness just as much as on nature's field. New thoughts, ideas, and emotions, spring up and out from existence the old, leaving behind them mere empty hulls in the shape of words, like fossil remains in the physical world. To a considerable number of people at the present day there are many words in the English language already passed into the fossil state. To this class belong such words and ideas as, hell, heaven, ghost, soul, immortality, providence, miracle, oath, witchcraft, etc. And to these might be justly added, in the case of many, religion.

To a monistic thinker who has lost the religion of his youth, there are two alternatives to choose: either to be satisfied with no religion at all, or to construct a new one from a new material. Dr. Carus appears to have chosen the latter. This new religion he defines as a man's consciousness of his relation to the whole cosmos. The relationship here implied is not personal as is the case in the abandoned faith. And the allegiance given to a personality in the old religion, becomes in the new allegiance to principles and to the laws of existence. And this when reduced to practice means simply correct living.

But why give the name religion to what already had an appropriate name of its own? Right living in all its bearings and relations is covered by the word morals. And the science whose function it is to discover the right sanctions or the philosophic grounds of morals, is known to the world as ethics or ethical philosophy.

[Ethical philosophy (the science of morals) is a department of science and must be studied in colleges. Religion is more than a philosophy to be taught in lecture-rooms to students. Religion is a popular philosophy to be preached to the masses. A philosophy appeals to man's intellect only, but a religion addresses itself to the whole man, body and soul, his heart and his head.—Ed.]

Suppose, however, all verbal objections be waived. Suppose we grant that this noble and philosophic view of life should be named religion. Will it answer the purpose intended? Can it fill up the gap left vacant by the old religion? I think not. The world is not good enough for such a religion, if religion it must be called. It is fit only for the select few—the well-disciplined souls. These alone can appreciate it, and live it. By the world outside this circle it will be utterly ignored.

[There is no perfection in the world, it is true. But Mr.

Theophilus's pessimism is not justifiable. It is a fact that not only science is popularized and made more accessible to the masses, but the masses also are better educated, and become so more and more. If monism is a truth, the religion of monism will either purify the old faiths or fill the gap produced by their destruction, and it will answer the purpose intended. Is truth—not the detailed truths of branch-sciences, but, truth in its broadest sense—is truth really fit only for the select few?—Ed.]

To the ordinary mind there is no connection necessarily between the fact of having an intellectual apprehension of the universe with its interdependent parts, and living a correct life. A theoretical knowledge of the laws and conditions of life have no direct influence over his conduct. Socrates appears to have held the doctrine that a knowledge of the right ensured its practice. In the case of the Greek sage personally the doctrine might have been correct. And the same might be said of others who have passed through the Socratic discipline. Applied to the world in general the doctrine is decidedly an error. In fact the history of civilization is little more than a repeated series of refutations of that doctrine.

The truth is mankind has never cared for high principles or for abstract laws or indeed for laws of any sort unless backed by power—power of some description such as that allied with wealth,

position, public opinion, or brute force. The world has always paid more respect to persons than to principles. It is more amenable to external force than to reason. When all other modes of arguments have failed to secure conviction, the *argumentum baculinum* has proved successful.

[What is 'wealth, position, public opinion, or brute force' but parts of the All! All these, if they are in contradiction and opposition to the cosmoical order of the All, will perish. Even empires cannot exist for good unless they are backed by the power which is the reality and the life of the cosmos. What a sad conception of life it must be that believes in the "argumentum baculinum" as the strongest power in securing conviction.]

[Every notion, every knowledge—be it right or wrong—influences man's conduct. If the moth knew that fire burns, it would shun the flame. And if a theoretical knowledge of the laws and conditions of life had no influence, let us despair and die; but the truth is they have a most powerful influence upon us.—Ed.]

From this consideration it must be seen that a religion founded on principles, such a religion as THE OPEN COURT offers to the world, has but a poor chance of success. And that chiefly because it lacks the power to enforce its principles. It is deficient in what Kant called the categorical imperative. This the old religion possessed in a high degree, and as a consequence, it held the entire world of mankind for successive thousands of generations, at its feet in a cringing and adoring attitude.

It is to be feared that the world at large is hardly yet sufficiently advanced in mental and moral development to enable it to dispense with its ancient Fetish, and to accept an unpretentious religion of principles in exchange for the awe-inspiring religion of force.

(To be continued.)

### THE GUIDE-POST.

A FABLE. BY HUDOR GENONE.

An innkeeper of Argolis, who had kept his tavern at the parting of ways for upwards of half a century, died; and his shade repairing, as the custom was, to the immortal gates of shadow, implored (for so the etiquette of the dead was, as with us now a matter of habit) high regard and honor from the gods at whose hands favor was.

"Nay," quoth the warder, helper to him called Hermes, messenger to the higher gods; "but say first what hast thou done to deserve favor at our heavenly hands? Speak and tell of thy good deeds and worthy."

The innkeeper, who was indeed worthy enough, was of a modest turn. Not used to dignities except perchance on rare occasions to serve them at his hostelry, he stood abashed, eyes drooping, unable to command words to answer fitly or even at first at all.

"Perhaps thou hast built a temple in thy time?" said the door god, not without a touch of mockery in his tone.

"O no!" answered the new immortal, "o no, indeed! I never even thought of doing that."

"Hast ever sent a gift of jewels or of gold to Delphi?"

"Never."

"Or of kine or kid?"

"Never."

"Not even a young dove?"

"No," answered the poor innkeeper sadly, "not even a young dove, nor any other thing."

"And what then in the way of good didst thou do in thy life? Canst I think of ought?"

"I kept my tavern," the man said very humbly. "All people who passed that way used to relate how I kept it well serving the best always and caring well for beast and man."

"And getting thy reckoning?"

"Surely. Why not? 'Twas my due."

"The gods," was the reply, surly and scornful, "honor them not who for pay do their duty. Is that thy notion of the heavenly kingdom?"

Now was the innkeeper mightily put about at all this sharp questioning. In his heart he felt himself, not knowing nor asking why, to be verily worthy, but unable to give account of himself, he was embarrassed and shamefaced, till, at last, and getting his brains, he ventured to speak aloud in his own behalf respecting one thing he had thought of that might—he humbly deemed—be permitted to count for something.

"One thing I did," said he.

"Another duty doubtless. If that alone, spare thy breath."

"No, 'twas no duty; and in my business was of a truth a hindrance; for had I done it not, many who else would have tarried over night with me, or when Boreas ruled and the storms of winter raged, even longer, hied away quickly."

"And this great thing?"

"'Twas no great thing," replied the supplicant, "'twas only that beyond my gate where the ways parted, I set up a guide-board, and kept it there; two hands pointing, one to either town, one north, one east."

"Ha!" jeered the warder, "callest thou that a worthy thing? Now step down, for here cometh one who set up a golden shrine. By the glow upon his face I can tell 'twas at least as much."

The innkeeper in sore tribulation, confident, it is true, of his own parity, but all the while himself to be a mote in the sunbeams of Olympus, hung his head disconsolate.

Disconsolate, till he was aware of a new presence, and looking furtively up, perceived before him the aforetime surly warder, now with changed demeanor, and over against him a radiant being with the glow upon his face. His face I say, but as well might I have said her face, save that in the calm majesty of those deep eyes lay a couchant power, seldom found in woman.

"I am Themis," said the being calmly, and then at once both knew that here was one neither man nor woman, nor any other bodily shape, save as shape was taken because the eye was made to see. So also the being spoke (thought materialized), because in no other way was it given to the brain to hear.

"I am Themis," the being said, "and I have heard the contention betwixt ye two, warder of this eternal realm, and thou, oh new immortal."

"I am justice and knowledge. Fear not, for I tell thee that thou art welcome to this my holy hill. Thou didst not know, but I know; thou didst not understand, but I understand; thou didst not see, but I see."

"In the way of our judgments, of a truth, this warder sufficeth to judge of the results of duty, to tell the meaning of acts, and to reward according to the deeds done in the body. But 'tis mine, oh new immortal, to look deep into the heart, and into the mystery of motive."

"Now I look, and I behold, for all the fifty years of thy earthly life, keeping thy humble tavern in Argolis, that thou didst set up at the parting of ways beyond thy gate a simple guide-board. No law compelled thee to set it there, nor did law compel thee to keep it, with its two hands pointing, one north, one east."

"Dost know what came of this work of thine?" Themis gazed, friendly, into the new comer's eyes.

"I know not," was the answer, "save as I believe that from time to time it served to help some stranger."

"Stranger? Then 'twas not for thine own acquaintance and kinsfolk thou didst set the guide-board."

"Not so; for surely they know the way already."

"Hast thou enemies?"

"I have; some I know; more I am sure that I know not of,

because in my way of livelihood I turned not aside to fawn for the favor of any mortal."

"Could it then be that this guide-board was of use, not only to the stranger but to enemy of thine?"

"That I cannot say; doubtless many such passed by the inn."

"Behold!" went on the angelic being, and so speaking drew forth a scroll. "Behold here writ the record of the work of good that, unknown to thee, thy guide-board did!"

Then he who of late had been but a simple citizen of Argolis, not learned in the script of Cadmus, felt his eyes opened so that he was able to trace the record.

And he saw there inscribed the names of a hundred three score and five, whose lives during all the fifty years, while the guide-board had been set up, were saved by it: some were old, some mid-aged, some young. Those journeying to the north would have taken the way eastward, or, on their road to the eastern town would have wandered else to the north.

The lives of part of this multitude (as was duly set forth on the scroll) were saved from the hand of the enemy; of others from wild beasts on a strange road; of others still, from storm or pestilence.

Good, too, of many another sort the record showed; of sons restored to mourning families; of husbands to their wives; of fathers to their needy children; and further, of renewed hope in many a breast; of kindled sparks of human sympathy for all humanity, in that one being had been found to feel and (unknowing of all the deep significance of feeling) to show the divinity of humanity.

And, before the new immortal's astonished eyes, the scroll unrolled, and the record grew and grew, telling of the vast results of each saved life, of each throb of hope, of each happy turn of fortune.

Then Themis, smiling, said, cheerily: "This was all thy work. Though then thou didst not know, I tell thee that though men judge by the act, and even at Heaven's gate itself the warders call for gifts to Delphi and Diana, at my high court is nothing save motive reckoned.

Because thou hast loved the right, and hast loved thy neighbor, and the stranger, and even thine enemy, and because thou hast done unto them as thou wouldst have had them do unto you, I bid thee come up higher. Come!"

So speaking Themis turned, and the new immortal, glad but yet wondering, followed on satisfied.

#### MIDSUMMER.

BY LOUIS BELROSE, JR.

How sweet to listen to the dove

When all the rest forget to sing,

And watch the swallows wantoning,

And butterflies the gold whereof

Comes sinking through the skies above

Like feathers from an angel's wing.

What comfort in the proof they bring

Of perfect wisdom, perfect love.

Why is it when the heart is stirred

To praise of Him who rules on high,

Of Him who made our earth and sky

From nothing with a single word,

Why is it that the little bird

Will eat the butterfly?

All truly wise thoughts have been thought already thousands of times; but, to make them truly ours, we must think them over again honestly, till they take root in our personal experience.

—Goethe.

#### BOOK REVIEWS.

MADAME DE SEVIGNE. *Gaston Boissier*. Translated by Melville Anderson. Chicago: A. C. McClurg & Co.

The above is the first issue in a series of short critical works on "Great French Writers," which has attracted much attention and praise on both sides of the Atlantic. The American publishers, with commendable enterprise, have arranged to re-issue these works in a new translation by Prof. Anderson, who has acquired a favorable reputation for such work in his translation of Victor Hugo's Shakespeare. These works on noted French writers do not aim to give a complete biography, and deal less with the personal history of their subjects than with their literary labors. The opening volume on Mme. de Sevigne is fully indicative of the merits and interest of those to follow. Mme. de Sevigne has never been a favorite with us among her illustrious countrywomen, presenting the image of a graceful and amiable woman with an inordinate love—if mother-love can ever deserve to be so called—for a rather commonplace daughter. M. Boissier's work revives this image, but in a way which adds an unexpected charm and freshness to the subject. Mme. de Sevigne will be chiefly remembered as an incomparable letter-writer in a day when letter-writing was a studied accomplishment. The art is one that is rapidly dying out in the present day, whether ever to be revived in a succeeding period of less haste and waste than our own, remains to be seen. Mme. de Sevigne's life presents us with a clear picture of the social life of France succeeding that period of mingled intrigue, gallantry, and intellectual growth, marked by the Hotel de Rambouillet and the Fronde. In the subject of M. Boissier's sketch we have the picture of a woman of pleasing and lively disposition, not holding herself above the manners and ideals of her age but able to resist its temptations and avoid its dangers. C. P. W.

GEO. SAND. *E. Caro*. Translated by Melville B. Anderson. Chicago: A. C. McClurg & Co.

M. Caro's work forms the second in the series of "Great French Writers," republished, with a corrected translation of their own, by the firm whose imprint appears on the title page. We have not here a full account of the life, so full of rich and varied incident of George Sand, but a critical estimate of her writings and the literary and intellectual career of one of the most striking figures in modern times. M. Caro, rightly, we think, finds the secret of Geo. Sand's weakness and her false philosophy of life, in the fact, that she makes love—the love of man and woman—the dominating and justifying principle of human conduct. It is true, as the author points out, that she defends herself in this by the claim, that all love is of divine origin, but in her application of this theory she so confounds the divine essence with the selfish, human passion, that all true distinctions are lost, and serious harm is done. "Sensual Ideality—such is the secret vice of almost all the love passages in Mme. Sand," says her latest critic. "The one thing needful to this mind," he adds, "so strong, so rich in enthusiasm, is a humble, moral quality—viz., resignation." This is a virtue impossible where passion reigns, which proclaims its right to destroy and ignore all conventional bonds. But though he speaks plainly on this portion of his subject, M. Caro is too just and sympathetic a critic to stop here, and has many a word of wise and enthusiastic praise for the author of *Consuelo*. He lets her speak for herself as much as he can, and she nowhere does this better than in a letter to Flaubert,—one of the forerunners of the naturalistic school which was to replace the romance-period of which she stood at the head. "Retain your faith in form," she says to this over-nice manipulator on words, "but occupy yourself more with substance." "Form," she tells him, "is but an effect; not an end. A novel must be first of all human, and cannot be saved by being well-written." C. P. W.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXII.—Continued.

Knips prepared himself for his first lesson. He began by drawing forth his paint-box, several complete letter-writers, and a book or two on etiquette. He painted several coats of arms, and from the books he abstracted some respectful forms of speech, such as the servile language of our Government officials have sanctioned in intercourse with the great, and learnt them all by heart. At the proper hour he presented himself to the Chamberlain, polished and fragrant, like a flower whose strength of stem had been extracted by the heat of the midday sun. Thus he was brought into the presence of the Prince, and almost withered into nothingness as he approached the chair in which he was to sit; he began his lecture by drawing out of a small portfolio a design of the Prince's ancestral coat of arms and a sketch of the Chamberlain's armorial bearings; he laid them before the Prince with the deepest reverence, and added his first explanations.

His lecture, to use the Chamberlain's own words, was magnificent; his obsequious arabesques which wound themselves into his discourse were prolix, it is true, but not disagreeable; they were comical, yet well-suited to the scrolls he was lecturing on. He frequently brought drawings, and books on heraldry, and engravings from the library for inspection, and showed himself more thoroughly informed than was, perhaps, necessary. If he chanced to fall into historical discussions, which were more interesting to him than his hearers, the Chamberlain would simply have to raise his finger, and Knips respectfully resumed the proper topic. The gentlemen took more pleasure in his lectures than in many of those given by the Magister's patrons. The lessons were continued throughout the term, for it was discovered accidentally that Knips had a good deal of knowledge of tournaments, tilting, and other knightly amusements. He told the Prince about the old festivities of his noble house, described the ceremonial accurately, and even knew the names of those who had assisted at them. His knowledge appeared wonderful to his hearers, though it cost him little trouble to collect this information. At the conclusion of the course he was richly rewarded, and his hearers regretted that this strange figure, with his old-fashioned knowledge, was no longer to lecture before them.

"Look here, mother," cried Knips, entering his room, and taking a small roll of money out of his pocket; "that is the largest sum I have ever earned."

The mother rubbed her hands. "My blessing upon

the gracious gentlemen who know how to value my son!"

"To value?" replied Knips, contemptuously. "They know nothing about me or my learning, and the less one teaches them the better they are pleased. It is a labor for them even to look for what stands at everybody's disposal, and what has been put in hundreds of folios is new to them. I treated them like little boys, and they did not find it out. No, mother, they understand how to value me even less than the Professor world here. No one appreciates my knowledge. Yes, there is one that does," he murmured to himself, "but he has more pride than the Chamberlain. The Chamberlain seems to wish to inform himself about the old tilts and masquerades; I will send him my little edition of Rohr as a present. There is so little in it that it is good enough for him. I bought the book for four groschens; the parchment is still tolerably white. I will wash it with sal-ammoniac, and paste his coat of arms into it. Who knows what may come of it?"

He cleaned it, and prepared his paints.

"The world is full of tricks, mother. Who would have thought that I could have earned anything by this old absurd nonsense of heraldry?" He drew and painted at the coat of arms. "I have seldom brought gold into the house, and then it was always for underhand traffic that did me no honor." Here he broke off. "I will once more put on my livery when I take him the book, then put it out of sight."

\* \* \*

In the district of Rossau the road surveyors put up their stakes, and at the University, Magister Knips placed the white pig's-skin binding in the hands of his illustrious patron.

Ilse rejoiced that the road to her father's estate would be useful to every one, and the professor heard with interest that the man whom he had recommended had succeeded well, and he smiled kindly at the expressions of gratitude tendered by the Magister. But for the good formation of the new road, and the approved dexterity of the little man, the happy couple, who in both cases had hit upon the right person, were to receive thanks that they did not desire.

## CHAPTER XXIII.

## PHILOPENA.

One evening Ilse had placed the last remaining dainties of the holiday season on the table; Laura was rattling an uncracked almond, and asked the Doctor whence arose the time-honored custom of Philopena. The Doctor doubted the antiquity of the custom and could not explain its origin at the moment, but he was evidently perplexed at his uncertainty in the matter.

\*Translation copyrighted.

Thus, he neglected to request the mutual pledge of the double almond. Laura cracked the shell and carelessly laid two almonds between him and herself, saying: "There they are."

"Shall we share them?" cried the Doctor, gaily.

"If you like," replied Laura, "giving and taking, as is usually done. But it must be only in joke," she added, thinking of her father; "and no presents."

Both ate the almonds with the laudable intention of losing the game. The consequence was that the affair did not advance. Laura, in the course of the following week, handed books, tea-cups, and plates of meat to the Doctor. He was dumb as a stick, and never said, "I am thinking of it." Had he forgotten the agreement, or was it his usual chivalry? But Laura could not remind him of his forgetfulness, otherwise she would win the philopena. She again became very angry with him.

"The learned gentleman does not hand anything to me," she said, to Ilse; "he treats me as if I were a stick."

"It must be unintentional," replied Ilse; "he has forgotten it long ago."

"Of course," cried Laura; "he has no memory for a pretty joke with such an insignificant person as I am."

"Make an end of it," advised Ilse; "just remind him of it."

It so happened that the Doctor, on one occasion, could not avoid picking up a pair of scissors, and handing them to her.

"I am thinking of it," said Laura; and added, pertly, "that's more than you do."

After that she offered the Doctor the sugar-bowl; the Doctor took a piece of sugar out civilly, but was silent.

"Good morning, philopena," she cried, contemptuously.

The Doctor laughed, and declared himself vanquished.

"It is not very nice of you," continued Laura, eagerly, "to have cared so little about your philopena. I will never eat one with you again; there is no honor in winning from gentlemen who are so absent-minded."

Shortly after, the Doctor handed her a small printed book in beautiful binding. On the first page there was written, "For Miss Laura," and on the second, "The Origin of Philopena; a Tale." It was the history of the beautiful daughter of a king, who liked to crack and eat nuts, but would not marry; she accordingly invented the following stratagem. She presented to every prince who sought her hand—and they were countless—the half of a double almond, and she ate the other half. Then she said; "If now your High-

ness can compel me to take something out of your hand without saying the words, 'I am thinking of it,' I shall consent to marry you; but if I can induce your Highness to take something from my hand without saying these words, your Highness shall have your princely head shaven and forthwith leave my country." But there was a trick in the fulfillment of this contract; for according to the customs of the court no one could put anything into the beautiful Princess's own hand on pain of death, but he must give it to the lady-in-waiting and she would hand it to the Princess. But if the Princess herself chose to take or hand something, who could prevent her? Thus it became a bitter pleasure for the wooers. For however much they might endeavor to induce the Princess to take something out of their hands without the intervention of the lady-in-waiting, the latter always interposed and spoilt their best-laid plans. But when the Princess wished to get rid of a suitor, she was so gracious to him for a whole day that he was quite enchanted; and when he sat next to her, and was already intoxicated with joy, she took, as if by accident, something that was near her,—a pomegranate, or an egg,—and said, softly, "Keep this in remembrance of me." As soon as the Prince took the thing in his hand, and perhaps was preparing to say the saving words, the thing burst asunder, and a frog, a hornet, or a bat, flew out towards his hair, so that he drew back frightened, and, in his fear, forgot the words; whereat he was shaven on the spot, and sent about his business.

Thus years had passed, and in all the kingdoms roundabout, the princes wore wigs,—these have since become fashionable. Then it happened that the son of a foreign king, while traveling upon some business of his own, by accident saw the almond-queen. He thought her beautiful, and at the same he took note of the artifice that had ruined the hopes of her former suitors. Now a little grey dwarf in whose favor he stood, had given him an apple, at which he might smell once every year, and then a clever idea would occur to him. He had, therefore, become very famous amongst all kings on account of his clever ideas. Now the time of the apple had come; he smelt, and at once this bright thought came him: "If you would win the game of giving and taking, you must under no conditions either give anything to her or take anything from her." And so he had his hands firmly bound in his girdle, went with his Marshal to court, and said he also would be glad to eat an almond. The Princess was much pleased with him, and had the almond handed to him. His Marshal took it and put it in his mouth. Then the Princess inquired what that meant, and why he always carried his hands in his girdle. He answered that his Court customs were even stricter than hers; and he must not take or

give anything with his hands, but only with his feet or head." The Princess laughed, and said:

"In this way we can never manage our game!"

He shrugged his shoulders and answered:

"Only in case you will condescend to take things from my boots."

"That can never be," cried the Court in chorus.

"Then why did you come here?" exclaimed the Princess, vexed, "if you have such stupid customs?"

"Because you are so beautiful," returned the Prince; "and if I cannot win you I can yet look upon you."

"I can say nothing against that," answered the Princess.

So the Prince remained at Court, and came to please her more and more. But as she too was of a mischievous disposition, she endeavored in every way to mislead him and persuade him to draw his hand out of his girdle and take something from her. She conversed much with him, and made him presents of flowers, bonbons, and smelling-bottles, and at last even of her bracelet. Many times his hands twitched, but he felt the pressure of the belt and recollected himself, nodded to the Marshal who collected the things, and said:

"We think of it."

Now the Princess became impatient, and so one day she began after this fashion:

"My handkerchief has fallen down; could your Highness pick it up for me?"

The Prince took the handkerchief by the ends of his toes and waved it; the Princess bent down, took the handkerchief from his feet, and cried out, angrily:

"I am thinking of it."

A year had passed thus, and the Princess said to herself, "It cannot continue so; an end must be made of the affair, in one way or the other." So she began thus to the Prince:

"I have the loveliest garden in the world, which I will show your Highness to-morrow."

The Prince smelt at his apple again. When they came to the garden the Prince began:

"It is wonderfully beautiful here; that we may be able to walk together in peace, and not be disturbed by our game, I beg, my dear Princess, that you will adopt my Court custom, if only for an hour, and allow your hands to be bound. Then we shall be sure of each other, and nothing vexatious can happen to us."

This did not please the Princess, but he entreated and she could not refuse him this trifle. Thus they walked together, with their hands bound in their girdles. The birds sang, the sun shone warm, and from the branches the red cherries hung down almost touching their cheeks. The Princess looked up at the cherries, and exclaimed:

"What a pity it is that your Highness cannot pluck some of them for me."

The Prince answered, "Necessity is the mother of invention;" and seizing a cherry with his mouth he offered it to the Princess. Nothing remains for her but to put her mouth to his in order to take the cherry, and when she had the fruit between her lips, and a kiss from him in addition, she could not at the moment say, "I am thinking of it."

Then he exclaimed, aloud, "Good morning, *Philopena*," drew his hands out of his girdle and embraced her; they were of course married and if they have not since died, they still live together in peace and happiness.

This story the Doctor had written and caused to be printed especially for Laura, so that no one else could have the book.

Laura carried the book to her private room, looked with pride on her name in print, and repeatedly read the foolish little story. She walked to and fro reflecting; and when she thus considered her relations with Fritz Hahn, she could not feel easy in her conscience. From her childhood she had been under obligations to him; he had always been good and kind to her; and she, and still more her father, had always caused him vexation. She thought penitently of all the past, up to the cat's paws; the indefinite feeling she had concerning the "*Philopena*" was now clear to her; she could not be as unembarrassed as she ought to be, nor as indifferent as she would wish, because she was always under the heavy burden of obligation. "I must come to an understanding with him. Ah! but there is a barrier between him and me,—my father's commands." She revolved in her mind how, without acting against his commands, she could give the Doctor some pleasure. She had ventured something of the kind with the orange-tree; if she could devise anything that would remain unknown to those over the way there would be no danger; no tender relations and no friendship would arise from it, which her father might wish to avoid. She hastened down to Ilse, saying, "My obligations to the Doctor oppress me more than I can express; it is insupportable to feel myself always in his debt. Now I have bethought me of something which will bring this state of things to a conclusion." "Take good care," replied Ilse, "that the affair is really brought to a conclusion that will stand in the future."

(To be continued.)

Banish gloomy fancies and dark forebodings. A majority of expected and dreaded ills never come, and in anticipating and fearing them we make needless shadows for our lives.

Every virtue that is admirable in woman is equally admirable in man.

Virtue, temperance, sweetness of temper, love and charity are of no sex, but shine equally in all.—*Elmina Drake Stenker.*

## NOTES.

The essays by M. Alfred Binet on the Psychic Life of Micro-organisms will be continued in No. 55. Originality of research and correctness of inference as to psychic phenomena, especially mark the articles to follow.

MORRISON I. SWIFT.

In No. 23 Morrison I. Swift makes a vigorous appeal to the churches that they become actively interested in what is generally known as "The Social Problem," and that they take the lead in Christianizing the people after the manner practiced by Jesus in Judea and by his disciples, as related in the New Testament. Mr. Swift's language is clear, eloquent, pervaded by an ideal humanitarianism, and is not only respectful to the clergy but even reverent. He thinks the opportunities of the present and the future are in the hands of the churches, and that the clergy may lead the van of social progress instead of trailing along behind the baggage wagons, as they have so long been contented to do. "In this country," he says, "where the church has the allegiance of so large a portion of the people, where it represents a large proportion of the specially organized moral forces of the land, where finally its material resources are almost unlimited and the money power of the country is its friend and supporter, it would be possible for the church to bring about the reform that is needed, with little difficulty, if it desired to do so." Here Mr. Swift is confronted with the important objection that should the church take the lead in the social revolution or even in social reformation so far as "to establish such fair distribution of the products of human industry that superabundance and luxury will not exist," the "money power of the country" would cease to be its "friend and supporter" and the clergy might cease to be a priesthood. He presents the difficulty thus: "It is said by some that the pulpit will not go much beyond those who maintain it. This is to acknowledge that the opinions of the clergy are to-day bought and paid for, just as lawyers are hired and legislators sent to uphold the ideas of their constituency." Notwithstanding this difficulty, Mr. Swift sees "a slumbering lion in the Christian ministry, which will, ere long, awaken and put forth its formidable powers for the poor and the oppressed."

Two other essays by Morrison I. Swift, are contained in Nos. 32 and 44. In the one he speaks of *The Scholar as a Reformer*, and in the other of *The Masses as Reformers*. The scholar has imbibed something of the historic spirit; he perceives, moreover, that the change in human institutions must ever be along the line of the moral and the ideal. Life can not be conceived in its full import, until the individual comprehends himself as the bearer of the rare essence and as containing, in no merely figurative way, the temporal hereafter. It is the mission of the scholar to reveal the larger and encompassing world of his soul, not of the bookish professional scholar but of him who has sought a profound comprehension of the meaning of life in its complexity and breadth. He must guide the masses, he must clear away the mystifying creeds and establish the truth that all men are born to live moral and beautiful and expanding lives in whatever sphere they may labor.

Mr. Swift considers the masses as the raw material for reform. There are rich people who think that general betterment means loss to them. But to dread reform is to misunderstand. Whatever is imperfect in society is injurious to all classes. A reform at one point reaches every point. The essayist sets great hopes on the masses—indeed, hopes too great, which may prove illusions. "Their minds," he concludes, "are more fluid and therefore they are more capable of growth into a surviving harmony with the conditions of life than those whose adaptations were formed earlier and in less enlightened times. . . . They are to become an infinitely more important factor in the life of the race than ever before." . . .

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents, 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourne and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Jones. Price, 10 cents.  
Social Ideals. By David A. Wasson. Price, 10 cents.  
The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Grumble. Price, 15 cents.  
A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

# AMERICA.

## WHY?

Because it is the only paper in America that advocates *American rule* in the United States.

Because AMERICA gives each week for ten cents the equivalent of the contents of a 35c. monthly.

Because AMERICA has a larger corps of distinguished contributors than any paper in this country.

Because it prints each week stories, essays, poems and miscellaneous articles from such authors as these:

Sen. Allison, Sen. Cullom, Sen. Manderson,  
Sen. Teller, Sen. Mitchell, Sen. Dawes,  
Sen. Stewart, Hon. Theodore Roosevelt,  
Seth Low, Hon. Andrew D. White,  
Ella Wheeler Wilcox, Bishop Cox,  
Hon. James Russell Lowell, Admiral Porter,  
Charles Dudley Warner, James Whitcomb Riley,  
Frank R. Stockton, Edgar Fawcett,  
J. T. Trowbridge, Edgar Saltus, Robert Grant,  
Julian Hawthorne, W. Clark Russell,  
and scores of others equally famous.

Because you can subscribe one year for \$5.50, six months for \$2.00, three months for \$1.00.

Because you can buy it of any newsdealer for ten cents per copy.

Because if you buy a copy and can truthfully state that its principles are not worthy of the support of every American citizen, your money will be refunded on application to

## Former Contributions to 'The Open Court.'

### PLANTATION FOLK-LORE.

L. J. VANCE. .... In Nos. 41, 45, and 46.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40, 42, 44, 46, 48, and 51.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

# LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

"Full of novel thought."—*Chicago Herald.*

"The subject is discussed with great clearness and simplicity."—*Book Chat.*

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News.*

"The absurdity of the theory is manifest."—*New York Science.*

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic.*

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon.*

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times.*

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star.*

"The world-wide reputation of its author, as the greatest living authority on philological subjects, is enough to command the careful perusal and respectful consideration of all who may take up this little book."—*Chicago Legal Advertiser.*

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social, and economic questions.

#### RATES OF ADVERTISING.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

EDWARD C. HEGELER.

The founder of THE OPEN COURT says in his article, "What the Monistic Religion is to Me," published in No. 25, page 725: "Religion is to me my relation, my union, to the All,—the idea that I am a part, a phenomenon thereof, that I, feel myself to be such, and that my actions are determined by ideas based on this fact. For millions of years the great whole has been in action, gradually developing out of the simplest animal forms the civilized man with the ever richer soul-structure in his brain. Whatever promotes this work is good, whatever obstructs or retards it, is bad. The reason why this progress is *good* is that the great All acts thus here on earth. That it is what in the ethical sense we call good. As modern psychological investigations show that "to will" and "to act" are identical (see Ribot, *Diseases of the Will*), it seems to me that fundamentally the old religious dogma, "that is good or right which is the will of God," is true, and *not* the theory of happiness and perfection. Our idea is that THE OPEN

Court shall definitely pronounce our religious opinion, and if this is erroneous, we wish to be refuted and we will publicly correct our errors."

FR. HELBIG.

In Nos. 22, 23 and 24 is a deeply philosophical essay, "The Fool in the Drama," by Franz Helbig, another German scholar whose works refer to the History of Civilization. In this essay are shown in a delightful way the wisdom and the folly of the fool in the drama, and his value, not only to the body politic, but to the morals of human life. In the folly of the fool in the drama we see our own folly; and the satire of the fool administered in jest leaves a lesson behind it that makes us think seriously when he laughter is done.

WHEELBARROW'S essays are contained in the following numbers of THE OPEN COURT:

Chopping Sand.....	page 353 in No. 13
The Laokoon of Labor.....	" 410 in No. 15

"WHEELBARROW" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft or was when I was a strong man. I was by profession a 'railroad man'; my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticises many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XIV.

### SOIL AND CLIMATE.

In the lower latitudes of the temperate zone the short winter ends about the middle of March, and in the course of the next following ten weeks the revival of nature spreads from the gates of tropics to the borders of the arctic circle. That progress is the symbol of a biological secret. The phenomenon of life originated in the home of perennial summer, and only in the course of successive ages the struggle for existence, on a more and more crowded soil, forced plants and animals to colonize the regions of the higher latitudes. Like the first spring-flowers that re-appear before the return of the migratory birds, plants were probably the pioneers of that northward (or rather pole-ward) migration. Next came birds; next reptiles and mammals; and the advent of man in the winter-lands of the upper latitudes is a comparatively recent event. Man, as a habitant of the snow-lands is, indeed, as yet only half acclimatized. Our instincts and day-dreams still turn towards the sunnier homes of our forefathers. We have to mitigate the uncongenial rigor of winter by all sorts of artificial contrivances, and the moral and physical characteristics of our early ancestors can best be studied in the habits of the primitive natives of the equatorial summer-lands.

Thrift can hardly have been a prominent virtue of our semi-sinian forefathers. The spontaneous abundance of a soil that produced perennial crops of tree-fruits, berries, and nuts, enabled its children to dispense with habits of economic prudence. Even now such habits are comparatively rare in the more fertile regions of the warmer latitudes. The negroes of the lower Congo rarely think it worth while to till their weed-encumbered maize-fields, and in years of scant crops eke out a living by fishing and berry-gathering. The Veddahs, or forest-dwellers of the Ceylon coast-plains, roam the woods like monkeys, living on such vegetables and edible insects as the seasons happen to provide. They build no houses, they wear no clothes and approach the dwellings of their agricultural neighbors only in times of scarcity, but at sight of a stranger

generally fly to the jungle with shrieks resembling the alarm-cry of the wanderer-ape. Even in Mexico thousands of half-wild forest-nomads live from hand to mouth, relying on luck to replenish their stomachs before hard times reach the extreme of actual famine. A colony of Swiss peasants in the state of Oaxaca was frequently visited by mendicant delegations of their shiftless neighbors, whose wants they repeatedly relieved by the simple expedient of laying in a store of *pasas secas* or wild grapes, dried and pressed like layer-raisins. "Why don't you put up a whole year's supply of such stuff?" a well-meaning colonist asked one of the improvident natives. "It wouldn't take you much more than a couple of weeks, would it?" "Not much, Señor," said the Indio; "but it would be hard work, and times have got better now."

Thrift, though, develops in the more sterile parts of the tropics as readily as in the frigid latitudes. In the foothills of the Atlas Mountains troops of natives range the ravines in quest of edible gums ("manna"), which they store in earthenware jars, together with the produce of small hill-gardens, tilled and watered with indefatigable perseverance. The Arabs of the Soudan undertake trading-expeditions to the far high-land of the upper Nile, and even to the west-coast of the continent, braving hardships and deadliest climates in the hope of accumulating the means of modest independence. The natives of the Canary Islands devote years of toil to their ideal of comfort in old age, and in parsimony and mercantile shrewdness are said to surpass the wildest Portuguese traders. The Turks have a proverb, that "one Greek can outwit ten Moslems and one Armenian can cheat ten Greeks," and Armenia in the next neighborhood of the torrid plains of Western Persia, is, indeed, a home of thrift in a sense of the word rarely realized in the most mercenary households of the London Jewry or the closest-fisted community of North Holland coast-traders.

"Freedom," says an American orator, "is a flower that flourishes best in the snow;" and the liberty-love of mountaineers is as proverbial as their patriotism. Freemen, however, are found in the burning plains of Araby, as well as on the frosty mountains of Switzerland, and a study of international analogies would lead to the far more correct conclusion that *the love of independence is a characteristic of sparsely-settled countries.*

\* Copyrighted.

The desert-dwellers of the Soudan, of Tartary, Afghanistan, Western Mexico, and Patagonia, have preserved their liberty as effectually as the highlanders of Scotland and Montenegro, and the homes of independence which, like social oases, are found here and there in the midst of despotic empires, are nearly always either thinly settled plains or specially inaccessible uplands. The power of the Czar has been for centuries defied by the wild Cossacks of the Donian steppes. The mountaineers of Luristan have never acknowledged the authority of the Shah, and can rarely be induced to pay even the nominal tribute promised by their chief emir as the price of exemption from military service. The highlanders of the Spanish Pyrenees still insist on the privilege of their *fueros*, or local autonomies, which the lower provinces of the Peninsula were forced to renounce centuries ago. The hill-tribes of Wales have maintained a similar independence, and at this moment (July 1888) are fiercely resisting the payment of tithes in support of the established Anglican Church. The Hungarian spirit of national independence has always found its chief strongholds among the half-nomadic herders of the *Pusta*—the great pastoral plain, extending from Budapesth to the threshold of the Iron Gate. Ice, *per se*, would seem to form a rather brittle bulwark of national independence. In the thickly settled lowlands of Central Russia not freedom only, but the very desire of freedom, appears to have been stamped out by ages of despotism. Overpopulation has tamed the once stubborn mountaineer of the Silesian highlands; the flower of freedom has ceased to "flourish in the snow" of Finland and Poland. Still, the love of independence is a primitive and deep-rooted, the love of industry a factitious and comparatively recent virtue. At every favorable opportunity the subjects of despotic governments are apt to throw off their yoke and revert to the freedom of the *Juventus Mundi*, the golden age of sheltering woodlands and free hunting-grounds. Industrial nations, on the other hand, continue to produce a considerable percentage of incurable idlers—"waiters on Providence," who prefer intermittent distress to constant toil, and accept comfort only as the free gift of Fortune. Such drones are found in Russia and Canada, as well as in Spain, but are rather rare in communities where self-help is the only alternative of starvation.

With more invariable distinctness the influence of climate asserts itself in the contrast of mysticism and rationalism. The skeptic Condorcet suggests that the enforced indoor-life of northern nations may have favored mental activity and its consequent protests against the spook-traditions Grandmother Church; but a tendency to mysticism appears rather a natural concomitant of a fervid climate, and irrespective of

outdoor or indoor life, would seem to have biased the secular as well as religious literature of all southland nations. Convents, with their enforced habits of seclusion, were nowhere more numerous than in Buddhist India, the birthland of monastic celibacy, and the constant mental activity of millions of pundits and enthusiasts resulted chiefly in vagaries:—lucubrations nearly as worthless from a scientific point of view as the recorded ravings of a lunatic convention. With the exception of a few works on grammar and rhetoric the vast literary treasure-halls of Buddhism and Brahmanism are filled chiefly with day dreams: Biographies of imaginary kings, chronicles of imaginary saints, travels in phantom-land, records of extravagantly absurd prodigies and miracles—fancy running riot in constant defiance of common sense. The Buddhist scriptures abound with supernaturalism to a degree sufficient to surfeit a Spanish nunner; but in China the same religion already begins to sacrifice myths to morals, and the Japanese Nahagathas, or Buddhistic Protestants, have retained only the principle of pessimism, and regard the miracle-legends of their orthodox brethren very much as a Unitarian clergyman would regard the monk traditions of southern Italy.

Comparative mythology has clearly demonstrated the Indian origin of Grecian polytheism; but in the climate of Attica the seven thousand gods of the Brahmins were gradually reduced to five or six dozen, and the freethought of Diagoras and Lucretius often rises to the regions of pure pantheism, palliated by prudential, rather than reverential, concessions to the prejudices of influential conservatives.

The doctrine of Zerdusht (Zoroaster) is the parent both of Judaism and Islam, but the Unitarian zeal of the great Hebrew lawgiver and his Arabian successor failed to eradicate the mythological tendency of their followers, who in default of pantheon-sagas amused their fancy with tales of ghins and angels, miracle-stories and mysterious prophecies. Prior to the advent of Mohammed the religion of his countrymen seems to have been almost as fantastic as Brahmanism.

They worshipped an incarnation of the Moon, a lunar spectre that had frequently visited the hills of Yemen in the form of a white lioness, and now and then in the guise of a veiled girl. The sun, too, was supposed to indulge in such metamorphoses. On one occasion an ancestor of the prophet had been frightened by a radiant bird that pursued him with fierce screams, demanding a vow of celibacy, to prevent the birth of a boy destined to overthrow the altars of the sun-priests. Stars, serpents, and demons, were likewise apt to interfere in the concerns of mankind, and had to be propitiated with frequent gifts.

Those gifts are now reserved for the temples of

Allah, but the hearts of the southland population have remained with their idols, and in the night-camps of the Bedouins ghost-legends and wonderland stories are still as popular as in the times of their moon-worshipping forefathers.

The Hebrew exiles, on the other hand, have assimilated the rationalistic tendencies of their adopted homes. The ideal of monotheistic purism has been most perfectly realized in the synagogues of North America, certainly more perfectly than in any part of ancient Palestine.

(To be continued.)

#### SHELLEY'S ATHEISM.

ALVAN F. SANBORN.

It was a popular fallacy that Shelley was an Atheist. Like most popular fallacies this is a half-truth, and half-truths possess an astonishing vitality. Charles Dudley Warner, in the *Princeton Review* of November last, states what he considers Shelley's religious position very clearly. He says: "He did not deny God, but he did deny the God of Christianity as he understood Him." An Atheist denies God, and may exist in a country where the Bible and Christianity have never been heard of. There have been such in all countries and ages.

That Shelley then was not an Atheist a very slight study of his works will prove to us. Mr. Warner is right, however, in saying that Shelley did deny the God of Christianity, not so much though as he understood Him, from his own study of the Bible, but as he understood the theologians to understand him. It cannot be denied that Shelley often quite misunderstood the theologians, but the religion he protested against was, notwithstanding, in its general features that accepted by the church at the time. In his prose works, the real hostility to Christianity is most strongly affirmed, especially in the "Necessity of Atheism," "Letter to Lord Ellenborough," "Letter on the Trial of Richard Carlile," "Refutation of Deism," and "Proposal for a Religious Association." This hostility is naturally a less conspicuous and more subtle element in his poetry. Here it is sometimes necessary to read between the lines to discover it, but it is never lacking. He wrote three great poems of revolt: "Queen Mab," "The Revolt of Islam," and "Prometheus Unbound." These are interesting as showing the different forms with which he clothed his hostility at three different periods of his life. He had learned a great deal between the "Queen Mab" and "Prometheus Unbound," but the same fiery spirit of revolt animates both—a spirit in his early years entirely uncontrolled, but toward the end of his life, when the "Prometheus" was written, toned down and trained to do his bidding. Here in the "Prometheus," what might be

offensive if boldly stated, is skilfully disguised beneath the garb of the old mythology. That he might not be looked on as an Atheist (in the true sense of the term), Shelley took the precaution of appending a note to that verse of "Queen Mab" beginning, "There is no God," etc. "This negation," he says, "must be understood solely to affect a creative Deity." So in the preface to the "Revolt of Islam": "The erroneous and degrading idea which men have conceived of a Supreme Being, for instance, is spoken against, but not the Supreme Being itself." This same preface would have applied equally well to "Prometheus Unbound," where Zeus stands for the "erroneous and degrading ideas which men have conceived of a Supreme Being, not the Supreme Being itself," nor as Mr. Warner would have us believe for "Anarchy."

Those men who at the beginning of the century rejected Christianity were for the most part materialists. We would naturally expect Shelley to take sides with them. But in a letter to Horatio Smith he says: "I agree with him [referring to Moore], that the French and material philosophy are as false as they are pernicious." He was a firm believer in Berkeley's theory, and in "Hellas" he puts into the mouth of Ahasuerus a poetic version of it. In other poems we find the same thing stated in more general and less philosophical terms. Thus in "Adonais":

"Peace, Peace! he is not dead, he doth not sleep—  
He hath awakened from the dream of life—  
'Tis we, who, lost in stormy visions, keep  
With phantoms an unprofitable strife,  
And in mad trance strike with our spirit's knife  
Invulnerable nothings."

In the "Conclusion" of the "Sensitive Plant" is the same idea:

"It is a modest creed, and yet  
Pleasant, if one considers it,  
To own that death itself must be,  
Like all the rest, a mockery.  
"That garden sweet, that lady fair,  
And all sweet shapes and odors there,  
In truth, have never passed away:  
'Tis we, 'tis ours are changed! not they."

That these verses are not mere freaks of fancy, but sound convictions, he tells us in the essay "On Life." "I confess that I am one of those who am unable to refuse my assent to the conclusions of those philosophers, who assert that nothing exists but as it is perceived. . . . Those who are subject to the state of reverie feel as if their nature were dissolved into the surrounding universe, or as if the surrounding universe were absorbed into their being. They are conscious of no distinction. And these are states which precede, or accompany, or follow an unusually intense and vivid apprehension of life." Shelley confesses in another part of this essay that he was for a *very short time* captivated by materialism, a system which he says allows its disciples to talk and dispenses them from think-

ing." This is, of course, true. Shelley is the best historian of his own philosophy. It is true so far as his *philosophy* is concerned, but materialism never got the slightest hold on his *poetry*. "Queen Mab," which represents by his own admission his immaturity, has nothing of it. As a poet he is from first to last a transcendentalist. His poetry was not and could not be materialistic, because it was not in the nature of the man. The nature which would not permit him to remain a materialistic philosopher, made his poetry immaterial and spiritual, even for the brief time that he was a materialistic philosopher. And it took only a little while for poetry and philosophy to become indissolubly and indistinguishably blended.

Shelley was hardly of this earth earthy. I can think of him only as a fiery, disembodied spirit. He is the most spiritual of the poets, in that he more than any other has attempted (how vainly, but how beautifully!) to "express the unutterable." His life was one vast uninterrupted yearning after the infinite, an incessant hungering and thirsting after righteousness. His life and his poetry are one. He is walking in the garden. There in the exquisitely delicate and fragile sensitive plant, he sees the embodiment of his own quivering spirit:

"But none ever trembled and panted with bliss  
In the garden, the field, or the wilderness,  
Like a doe in the noon-time with love's sweet want,  
As the companionless Sensitive-Plant.  
— — —  
It loves, even like Love, its deep heart is full,  
It desires what it has not, the beautiful!"

He is roaming aimlessly through the fields, lost in deep reverie. Suddenly the song of the skylark startles him—the skylark that seems fairly to float in its own swelling music, so prodigal is it of its melody. Shelley feels his own impotence:

"Teach me half the gladness  
That thy brain must know,  
Such harmonious madness  
From my lips would flow,  
The world should listen then as I am listening now."

We read; and feel as Shelley felt. He feels the cool breeze upon his forehead. It does not soothe him, for at once he longs to soar upon the wings of the west wind:

"O lift me as a wave, a leaf, a cloud!  
I fall upon the thorns of life; I bleed!  
A heavy weight of hours has chained and bowed  
One too like thee, tameless, and swift, and proud.

"Make me thy lyre even as the forest is:  
What if my leaves are falling like its own!  
The tumult of thy mighty harmonies  
Will take from both a deep, autumnal tone,  
Sweet though in sadness. Be thou, spirit fierce,  
My spirit! Be thou me, impetuous one!"

His eye is arrested by the scudding cloud. It is enough; the storm-cloud must be his chariot, and he must career through space. He cries out:

"O that a chariot of a cloud were mine!  
Of cloud which the wild tempest weaves in air,

When the moon over the ocean's line  
Is spreading the locks of her bright gray hair!

"O that a chariot of a cloud were mine!  
I would sail on the waves of the billowy wind  
To the mountain peak and the rocky lake,  
And the — — — — —"

He breaks off in utter despair of giving vent to the yearning within him. Thus the poem always remained. He could never finish it. He is sitting in the twilight by the window of his Italian villa. Strains of uncertain music float in from the distance. At once he loses himself in ecstasy:

"I pant for the music which is divine,  
My heart in its thirst is a dying flower;  
Pour forth the sound like enchanted wine,  
Loosen the notes in a silver shower;  
Like a herbless plain for the gentle rain,  
I gasp, I faint, till they wake again.

"Let me drink of the spirit of that sweet sound;  
More, O more!—I am thirsting yet;  
It loosens the serpent which care has bound  
Upon my heart, to stifle it:  
The dissolving strain, through every vein,  
Passes into my heart and brain."

How his spirit burns itself with unutterable desire for that which is itself unutterable! "Alastor" is the wail of passionate longing never satisfied. "Epipsychidion" is the plaint of a spirit chained fast to earth in full view of the glories of Heaven. It is mingled pain and pleasure; pleasure in the sight, pain because of the bonds. The closing lines show the intensity of anguish.

"The winged words on which my soul would pierce  
Into the heights of love's rare universe,  
Are chains of lead around its light of fire,  
I pant, I sink, I tremble, I expire!"

The moth that rushes into the flame it loves, only to fall down with singed wings is a favorite illustration of Shelley's. It is a true picture of what he himself does. It is a common thing to dream of the fulfillment of desires which we know to be hopeless. Upon awaking how are we overwhelmed, first with a feeling of bewilderment, and then of utter desolation! So Shelley falls down, temporarily despairing, but with hands still outstretched to clasp the fleeting vision of ineffable beauty of which he has had soul-thrilling glimpses. As we shall see later, there is this difference between Shelley and the dreamer: Shelley believes the vision will return.

In what does Shelley find or try to find, the satisfaction of this yearning? In Pantheism. I say Pantheism for the lack of a better name. Yet it is of very little use to attempt to assign a poet to any of the philosophical schools. Christianity as he understood it, repelled him; materialism could not satisfy him, and so he made his God the Universe. His yearning was the yearning for the Universal. Nothing else could suffice. "In the language of reason," he said, "God and Universe are synonymous." In the "Zucca," a poem very seldom read, he expresses his Pantheistic creed.

"I loved—O no, I mean not one of ye,  
Or any earthly one, though ye are dear  
As human heart to human heart may be—  
I loved, I know not what—but this low sphere,  
And all that it contains, contains not thee,  
Thou, whom, seen nowhere, I feel everywhere.  
From heaven, and earth, and all that in them are,  
Veiled art thou like a — — — star,

"In winds, and trees, and streams, and all things common,  
In music, and the sweet unconscious tone  
Of animals, and voices which are human,  
Meant to express some feelings of their own;  
In the soft motions and rare smile of woman,  
In flowers and leaves, and in the grass fresh shown,  
Or dying in the autumn,—I the most  
Adore thee present, or lament thee lost."

The best commentary upon this point is Shelley's complete works. It is the only satisfactory one. I will quote, however, three verses from "Adonais" as one of the best illustrations of his Pantheism.

"Nor let us weep that our delight is fled  
Far from these carion knees that scream below;  
He wakes or sleeps with the enduring dead;  
Thou canst not soar where he is sitting now.  
Dust to the dust! but the pure spirit shall flow  
Back to the burning fountain whence it came,  
A portion of the Eternal, which must glow  
Through time and change, unquenchably the same,  
Whilst thy cold embers choke the sordid hearth of shame.

"He is made one with Nature: there is heard  
His voice in all her music, from the moan  
Of thunder, to the song of night's sweet bird;  
He is a presence to be felt and known,  
In darkness and in light, from herb and stone  
Spreading itself where'er that power may move  
Which has withdrawn his being to its own;  
Which wields the world with never wearied love,  
Sustains it from beneath, and kindles it above.

"He is a portion of the loveliness  
Which once he made more lovely: he doth bear  
His part, while the one Spirit's plastic stress  
Sweeps through the dull dense world, compelling there  
All new successions to the forms they wear,  
Torturing th' unwilling dross that checks its flight  
To its own likeness, as each mass may bear;  
And bursting in its beauty and its might  
From trees and beasts and men, into the Heavens' light."

Sad? perhaps so. Unsatisfactory? it may be. But Shelley is not the only one who has found it a blessed refuge.

So far Shelley was a Pantheist, but like Wordsworth, he was more than a Pantheist. Was he a Theist? I dare not say that he was any more than I dare say Wordsworth was. But as with Wordsworth, so with Shelley, this God, this Universal became a *Presence* (that was Wordsworth's word, he never says person), a presence with which he held communion, sweet communion, and which brooded over him. It is a beautiful conception and it underlies all his best work. In the essay "On Love," a prose piece, though it reads almost like poetry, he has the following: "There is eloquence in the tongueless wind, and a melody in the flowing brook and the nestling of the reeds beside them, which by their inconceivable relation to something within the soul, awaken the spirit to a dance of breathless rapture, and bring tears of mysterious tenderness to the eyes like the enthusiasm of

patriotic success or the voice of one beloved singing to you alone."

The same idea is more fully developed in the "Essay on Christianity": "Whoever is free from the contamination of luxury and license, may go forth to the fields and to the woods, inhaling joyous renovations from the breath of spring, or catching from the odors and sounds of autumn some diviner mood of sweetest sadness, which improves the softened heart. Whosoever is no deceiver or destroyer of his fellow-men—no liar, no flatterer, no murderer—may walk among his species, deriving, from the communion with all which they contain of beautiful or majestic, some intercourse with the Universal God. We live, and move, and think, but we are not the creators of our own origin and existence. We are not the arbiters of every motion of our own complicated nature; we are not the masters of our own imaginations and moods of mental being. There is a power by which we are surrounded, like the atmosphere in which some motionless lyre is suspended, which visits with its breath our silent chords at will. This power is God; and those who have seen God have, in the period of their purer and more perfect nature, been harmonized by their own will to so exquisite a consentaneity of power as to give forth divinest melody, when the breath of Universal Being sweeps over their frame." Surely that is not Atheism.

But with what does man's spirit commune? With a Universal Presence, it is true,—but what is this Presence? Wordsworth was satisfied with the Presence. Shelley names it. It is the Spirit of Love and Beauty.

"I vowed that I would dedicate my powers  
To thee and thine—have I not kept the vow?  
With beating heart and streaming eyes, even now  
I call the phantoms of a thousand hours  
Each from his voiceless grave: they have in visioned bowers  
Of studious zeal or love's delight  
Outwatched with me the covetous night;  
They know that never joy illumed my brow,  
Unlinked with hope that thou wouldst free  
This world from its dark slavery,  
That thou, O awful Loveliness,  
Wouldst give whate'er these words cannot express."

Love is the only deathless thing:

"For love and beauty and delight  
There is no death nor change; their  
Might exceeds our organs which endure  
No light, being themselves obscure."

Shelley's God then is not so very different from the God of the Bible after all, for is it not written that "God is Love?" Shelley's God is Love; his Universal is universal Love. Had this been his understanding of the God of the Bible, he would never have raised his voice in opposition. Sometimes he makes more prominent the idea of love, sometimes the idea of beauty. In "Rosalind and Helen," in the "Revolt of Islam," in "Queen Mab," in "Prometheus Unbound," it is as Universal Love that the spirit ap-

pears. While in the "Hymn to Intellectual Beauty," "Alastor," "Epipsychidion," "Adonais," and "The Sensitive Plant," he puts beauty in the foreground. But in them all it is the same spirit, for to Shelley's mind beauty and love are one from all eternity, and can no more exist apart than the inside and the outside of a curve.

The ever-fleeting vision in "Alastor," is the Spirit of Love and Beauty. "Epipsychidion" fell dead from the press. Not a copy of it was sold, because men could not grasp this conception of Shelley's. He knew it must be so; the dedication contains these lines:

"My Song I fear that thou wilt find but few  
Who fitly shall conceive thy reasoning;  
Of such hard matter dost thou entertain."

In a letter to John Gisborne, he says: "It is an idealized history of my life and feelings."

From the nature of the God he worships, Shelley's poetry is optimistic, not pessimistic. He is a most sanguine reformer. 'There's a good time coming,' is the burden of his message. This faith is something marvelous, more marvelous perhaps than the faith he derided as superstition. There is more of credulity in it at times. He is like the child running after the ever-receding colors of the rainbow, and he never gives up his childish faith that they can be grasped. Though he has attempted time and again to slake his thirst for beauty in mind-fabricated mirages, and has found only the hot sands of the desert when he touched his lips to them; yet he fully believes that sometime, somewhere, the living stream of perfect Love and Beauty will flow for the satisfying of the soul. The last two books of "Queen Mab," his first important poem, are given up to a glorification of the future. The last act of "Prometheus Unbound," the work of his maturer years, is one vast hallelujah over the triumphs of Love. This is not denying sadness in his poetry. His poems are sad but not pessimistic. They are sad because they are optimistic, sad because the glorious future of which he feels assured and for which he is hungering and thirsting, seems now so very far away, so very unattainable. The appetite is a present one; its satisfaction is far removed. *A temporary* despair is the natural result.

To summarize then: Shelley protested against Christianity as it was taught, and made his God the Universal; with this Universal, which he named the Spirit of Love and Beauty, he held sweet communion. He firmly believed in its complete ultimate triumph. It is not my purpose to defend his creed. I am satisfied if I have made it reasonably plain. As a system, either of philosophy or theology, it may be very defective for all that I know. Shelley was a poet and not a philosopher or a theologian. Those who are in sympathy with his beliefs will, of course, other things being

equal, get most enjoyment from his poetry. But this sympathy is by no means essential to a keen appreciation, not nearly so essential in the case of Shelley as in the case of Wordsworth. There were two Shelleys: the destructive Shelley, and the constructive Shelley. The destructive Shelley was the Shelley of protest; his collaborator was the Lord Byron of Cain and Manfred. It was the unreasoning, indiscriminate violence of the destructive Shelley that made him hated by the church, though few perhaps will care to deny that the chastisement which the church received at his hands was to a certain extent deserved. There was no destructive Wordsworth, and so Wordsworth was not theologically hated, although his poetry was filled with conceptions as much at variance with received theology as Shelley's. The constructive Shelley belonged to the transcendental brotherhood of Coleridge and Wordsworth, of Carlyle and Emerson. These transcendental seers have done a noble work. Some may regret that they did their work outside the pale of the church. They have nevertheless left a heritage to the church which it is only just beginning to appreciate. It has at last ceased to slander them. It will soon, we trust, accord them the praise they deserve.

#### MONISM AND RELIGION.

A REJOINDER. BY D. THEOPHILUS.

*With Editorial Remarks.\**

##### II.

The religion and monism in which E. P. Powell is interested, apparently differ essentially from the monism and religion of which the editor is exponent. Mr. Powell's religion is the old one in a new dress—the old religion with a new nomenclature. And his monism also turns out to be simply dualism in disguise.

His essay appears to derive its plausibility as an argument against the one it criticises, solely by virtue of the vagueness and confusion of meaning attached to the two chief terms employed, namely, religion and science.

In the use of both of these words, he has deemed fit to deviate widely from the best historic precedents in giving them such sense as suited his own purpose. Indeed, he does not seem to draw any distinction between the two. Religion is science, and science is religion. They are, apparently, with him synonymous terms. It is manifest that it is by virtue of this confusion or identification of terms that he is enabled to give the direct negative to my statement, viz., that science and religion have been antagonistic. He says, "no religion exists to-day or ever did exist which was not essential science." And in support of this we are referred to Egyptian, Indian, and Assyrian legends about the origin of the world and the creation of things. The writer not only identifies religion with science, but makes the latter synonymous with legends, myths, beliefs, opinions, or speculations of the uncritical ages.

The attachment of such a signification to the word science is unwarrantable, unless at least, he forewarned us of his intention to use it in that sense. That he did not do, and for good reason, doubtless, for had he done so, the inconsequential character of his reasoning would be rendered thereby conspicuous, which is simply

\* Lack of space prevents us from writing an editorial article in answer to this Rejoinder. The necessary replications will appear as parenthetical insertions marked by hanging indentations.

this: religion is not opposed to science, that is to say, to beliefs, legends, or traditions, for all ancient forms of religion were both based upon and interwoven with such legends or speculations about the origin of the world and its contents.

The cogency of such reasoning manifestly rests on the presumption that science, belief, or legend, as well as religion, are synonymous terms. If we are not prepared to grant this, then the argument will have neither force nor even meaning.

Assuming the identity of religion and science, he says, they could not be antagonistic: if, however, they did conflict, the conflict, we are told, was merely a conflict between science and science, between an older and a later science.

[Mr. Powell, we understand, identifies science and religion in so far as the religions of yore were based on the scientific notions of those times. The advancement of science has altered our religious beliefs also, and if new scientific discoveries force our philosophers to remodel our conception of the world, our religious attitudes will have to be remodeled again, for man's religion is based upon his conception of the world, or as Mr. Powell expresses it, religion is science plus reverence.—Ed.]

Suppose for the moment this be granted. What follows? Plainly this, that the point in dispute would reduce itself into a mere question of evidences and proofs. The antagonism would be of a similar character to that between the Ptolemaic and Copernican theories, and the number of persons capable of taking part or interest in, or pronouncing upon it, would be equally as exclusive and select. The point at issue would be a mere question of gathering, sifting and systematizing facts, and verifying hypotheses: a matter of concern to the learned and competent only—the trained and disciplined intellects. What then becomes of the idea of the universality of religion; the statement that it is an ultimate fact\* of human nature? And, besides, such a consequence is opposed to actual facts. Religion has been a matter of concern to the uncultivated, and not to the learned. And that is not all, but the ratio of zeal for and interest in religion have been in inverse proportion to culture; whereas in the case of science the order is reversed. The ratio of interest in the latter has been in direct proportion to the degree of culture. The more the culture the more the devotion to science. Thus, the conclusion logically deduced from the given premises—that religion was merely a science and in conflict with another science—is at variance with actual facts inductively obtained. All this however by the way.

[The inverse ratio between religion and culture of which Mr. Theophilus speaks, is true enough if religion means idolatry and superstition. If religion comes in conflict with science, it is obvious that it cannot be the religious sentiments; the religious notions only can collide with the notions of modern science. And Mr. Powell is right when declaring that the conflict between religion and science means "whether we are bound to believe the scientific conceptions of 2,000 and of 4,000 years ago or those of to-day," and certainly the difference between the old creeds of supernaturalistic religion and the monistic aspect of religion is like that between the Ptolemaic and Copernican theories.

[Religion in the sense defined by THE OPEN COURT is a fact (not an ultimate fact) of human nature just as much as language, reason, science, and art are. This fact cannot be refuted by producing people who are relatively unscientific, unreasonable, or irreligious; for every man is (not absolutely, but relatively) moral, reasonable, scientific, religious, and ar-

tistic. All these properties are necessary consequents of the fact, that man is a speaking being.—Ed.]

The more serious portion of this paper must be reserved for the examination of the nature, sphere, and limits of religion and science respectively.

The word science, as used in my article, is limited in meaning to its usual accepted sense of exact or systematic knowledge: knowledge obtained through the processes of observation, experiment, reasoning, and verification; as opposed to opinion, tradition, fancy, or information, accepted on authority—unsifted or uncritical knowledge. The only extension of meaning that is allowed it, beyond its limited sense, is in making it embrace the word philosophy as well as science in the restricted sense.

From this limitation, all so-called knowledge involved in tradition, legends, or opinion, all uncritical knowledge is excluded; just the very kind of knowledge which my opponent, contrary to universal usage and the plain import of the language of the essay, makes it include.

The result is that a large portion of his article, considered as an argument against positions advanced in my own, is irrelevant, and therefore inconclusive.

[Mr. Theophilus apparently overlooks the fact that much so-called scientific knowledge of to-day is fancy, tradition, and unsifted or uncritical knowledge, accepted on authority. Science is rather the search for truth than truth itself. It seems as if Mr. Theophilus believes that the science of to-day is in possession of absolute truth, while religion in his mind appears to be the incorporation of unmixed superstition.

[If religion must needs be superstition, how strange would it be that most scientists and philosophers, as Kepler, Copernicus, Kant, have been religious. Most of them (as Kepler and Kant) have been religious in the broader sense of the word. They looked upon the results of their labor not with a disinterested indifference, but with awe, reverence, and admiration for the grandeur of the cosmical laws they had investigated. Other scientists have been religious in the narrowest sense of the word. Newton, for instance, was a most narrow-minded Wesleyan, and not only believed many absurdities, but also defended them publicly in books; imagining that his renown as a theologian would eclipse that of a mathematician.

[Prof. Mach's article in Nos. 46 and 48 of THE OPEN COURT, shows that our most scientific ideas of to-day are evolved from the crudest notions of past ages. They are the very same ideas (or if you please their descendants), only modified by transformation and adaptation.

[In connection with our replicatory remarks, we advise the reader to compare the review of Prof. A. Weber's pamphlet, "Die Religion als Wille zum ewigen Leben," on page 1195 of this number.—Ed.]

The main contention between my opponent and myself turns upon the use of the two words religion and science. Can they be employed interchangeably? Is religion science, or science religion? To these questions I answer in the negative. I hold that they represent perfectly distinct ideas, and are differentiated, the one from the other, by a sharp contrast.

Let us hold them up over against each other and mark a few of their characteristic features. A scientific knowledge is a cognitive act or process pure and simple, and nothing else. It is seeing things, or parts of things, in their relations; the things themselves as things, or as affecting the knower, are, for the time being, ignored. Science is absolutely disinterested: it has nothing whatever to do with one's sympathies or antipathies. Its end is gained when you have determined the relations of an object to its surroundings—when you have known the conditions or laws of its existence.

\*"Ultimate fact" is an expression which should be avoided. Facts are either verifiable facts or they are false. A discrimination between primitive, ultimate, or any other facts is just as untenable as between ultimate, final, and other causes.—Ed.

['Science is absolutely disinterested,' means, if it means anything, that science must be impartial and unbiased in the investigation of truth. But it does not mean that it does not affect the feelings of the scientist, or that it destroys his sympathies and antipathies. On the contrary, it can not be doubted that his emotional faculties are educated and refined by his labor and the results of his labor. The investigation of truth does not only illumine the head, it also purifies the heart.—Ed.]

Religion, too, as I pointed out in the former essay, rests upon an intellectual basis, it recognizes the existence of an agent or a personality, with whom mankind can enter into relationship. But the knowledge of the simple objectivity of this being and its external relations, is not what is sought for, as in the case in science. It is an object of concern to the believer or knower, solely by virtue of its supposed power to affect the feelings. Practically, in religion the cognitive element is scarcely present, except in the vaguest form; the emotional having absorbed all. Its origin in cognition might be traced somewhat thus: the unaccountability of the various processes of nature with which man had to contend, probably suggested to him, while in search for a cause, the existence of an agent or a personality like himself. In so far as our supposed primitive man was seeking for a cause of phenomena, he was simply a sort of crude man of science. He was merely exercising an intellectual act: he was not yet religious. For he had not yet discovered a religious object. The mere search after an explanation of things could not constitute such object.

But the moment he gave up the quest after knowledge and cut the Gordian knot of research, by substituting an agent or a personality with a power and a will, an agent made after his own likeness, and placed it, thus made, above, under, or in the essence of things, as an object for the feelings to play upon; he has clearly overstepped the boundary of cognition, and is fairly within the domain of religion.

The object presented by religion to the cognitive faculty is of such a character that its entire interest is centred, not in itself or its objective relations, but solely in its supposed power or virtue to put forth energy either to the advantage or disadvantage of the believer or knower. And herein, I repeat, lies its characteristic difference from science. It is simply an object created by the imagination for the feelings to act upon, and not for the intellect to know.

In this respect religion has exact analogies in such speculations or practices as alchemy, astrology, magic, and witchcraft. The object for mental apprehension in each of the latter was of value and interest to the devotee, not as a mere objective existence, obeying certain laws and behaving in certain ways, but by reason of the occult power or virtue it was supposed to possess, to affect the cognizing subject.

The metals were studied not with a view of learning their intrinsic character, laws, or relations, but because of their presumed power to convert other metals into gold.

The stars were contemplated, not to gain knowledge of their laws, but simply on account of their supposed influence over human destiny. And a knowledge of magic and witchcraft was valued for its command over evil spirits. The same holds good in the case of the so-called spiritualism of the present day.

And precisely of a like character is the object of religious knowledge. It has been of interest to mankind, solely by virtue of its supposed power to control the world and order human destiny. Deprive it of this characterization, and then religion as a fact ceases to exist.

When alchemy and astrology were discredited as gold-producing and fortune-telling processes, both words and ideas lost their hold on mankind. As soon as metals and stars became disinterested ob-

jects of cognition, and were studied on their own account; then alchemy lost itself in chemistry, and astrology became astronomy.

[Mr. Theophilus misrepresents alchemy as well as chemistry, astrology as well as astronomy. A true scientist, it is true, studies nature solely for the purpose of investigating the truth, but at the same time, it is well known, that knowledge is power. And the end of all science is to make man free and powerful. There have been many alchemists and astrologers who were, subjectively considered, as true scientists as they could be.

[Supernaturalism and dualism, but not religion, can be classed with alchemy and astrology. Strauss and Feuerbach, whose authority Mr. Theophilus erroneously claims to be in his favor, employ the word religion in a quite different sense. Strauss says, ('Der alte und der neue Glaube,' p. 182): "Limitation or transformation is not annihilation. Religion is not to us what it has been to our fathers; but it cannot be concluded from this fact that it is extinct in us. At any rate the essence of all religion remains, which is 'the feeling of absolute dependence.'\* Whether we say God or Universe, we feel absolutely dependent upon the one as well as the other."

[Feuerbach has succeeded in deepening Schleiermacher's definition that religion is the feeling of absolute dependence. He objects to the idea that religion is a mere passive feeling, and lays all stress upon man's activity raised by his feeling of dependence. Strauss says of him (p. 137), "Feuerbach justly declares that the origin, indeed the main essence of religion is man's want (Wunsch). If man did not want anything he would have no gods. What man wants to be, but what he is not becomes his god. Religion, therefore, is not only the dependence in which he finds himself, but religion originates from his want to react against, to deliver himself from, this dependence. Mere dependence would depress and annihilate him. He must protect himself from it, he must try to gain breath and freedom of action."—Ed.]

Precisely the same result must happen in the case of religion. Take from the object its personality and its capacity to create and govern, and reduce it to an unknown cause or causes of phenomena, and from that moment religion will be to you a dead letter. The entire domain of possible cognition is now occupied by science, and religion will have no place within human consciousness, metaphorically speaking, to rest the sole of her foot.

[This statement is correct from the agnostic standpoint, if 'religious' means 'superstitious' and nothing but that.

["Unknown cause or causes of phenomena" is an expression often used by agnostic philosophers, but it has no place in positive science. If an unknowable something or unknowable somethings, either behind or hidden within nature, must be supposed to cause natural phenomena, (in a similar way as Zeus has been supposed to cause thunder and lightning,) we may just as well look upon these "unknown causes of phenomena," as being personal agents, for the one view is just as much dualism as the other. Monism knows nothing of such a transcendent or mysterious causality.—Ed.]

(To be concluded.)

#### A PARABLE.

LOUIS BELROSE, JR.

A certain farm had long been deemed the best

Of all the country round; but war, neglect,

And folly joining, fields that once were decked

With plenty turned to swamp where vile weeds pressed.

\* This is Schleiermacher's definition.

And they were many brothers who possessed;

With minds like many ways that intersect;

All one in will to mend the fortune wrecked,  
But differing each from all in all the rest.

Some simply wished to root away the weeds;

Some counselled prayer, and others counselled spoil;

Some sought the prophets of the new-born creeds;

And one there was for management and toil,

Till choice of varied crops and different seeds,

With time and culture, should renew the soil.

#### BOOK REVIEWS.

DIE RELIGION ALS WILLE ZUM EWIGEN LEBEN. Prof. Dr. Alfred Weber. Strassburg: 1888. J. H. Ed. Heitz (Heitz & Mündel.)

Alfred Weber, Professor of Philosophy at the University of Strassburg, characterizes Religion in its most general and essential features as *Will*. It is the will to live on and to live eternally. Man has religion because he dies; he wants to know whether and how he can live after death; he wants to conquer death and this want produces religion. Weber defines "religion in its subjective sense as the awe which man has for powers (be they imaginary or real) of which he believes that they have a decided influence upon his fate \* \* \* and in its objective sense it is the whole growth of conceptions, ceremonies, and institutions which have originated from this reverent awe." Accordingly religion is 1, *will*, viz., the will to live; 2, *conception* or *idea*, viz., a conception of powers upon which our existence, and our fate, and future welfare depends; and 3, *certain actions or conduct* by which man hopes to gain the favor of those powers so as to gain the end of his will.

The medicine man of the savage, the necromancer, the magician, the priest, the theologian and law-giver, the philosopher, the naturalist and moral teacher, in so far as they are subjectively sincere, are one and the same person. Even to-day many congregations may be found in which the clergyman is *eo ipso* the man of learning and the physician, just as it has been in ancient Egypt, India, and Gaul. The methods of these men from the medicine man to the philosopher, necessarily change with a change of their conceptions of the powers upon which existence depends, but their ultimate end is the same.

Self preservation according to the main source of religion; of the lowest superstitions as well as of the highest form of philosophical religions. Religion, philosophy, and morals are with reference to their origin, identical; they are branches of one and the same tree. Religion is the will to live; philosophy, the will to know. But what else is the desire to know than the desire to govern the course of things, instead of being governed by them? Knowledge is power, and science, or the search for knowledge, is fundamentally nothing but the will to live. Moral conduct aspires to the same end. All morals, therefore, are "religious practice," just as philosophy is "religious theory." Even pure morals is a religion; "morals without any religious basis is self-delusion or humbug."

Professor Weber then shortly reviews the different stages of Religion. Man's religion changes as his conception of the power, upon which his existence depends is changed; but the main spring of religion, "the will to live," remains the same, unless we say that it is changed by this change of religious conceptions which, if purified by higher ideas, by science, and by a more comprehensive knowledge, is elevated and ennobled so that the mere 'will to live' becomes the will to live well. "Wille zum Leben" becomes "Wille zum Guten."

Professor Weber's sketch is written from a strictly impartial standpoint; an orthodox Christian can read it as well as a free-thinker, without taking offense. Professor Weber refrained from drawing the last consequences in reference to the burning religious questions of the day. We should have been glad to hear his opin-

ion on these subjects. It would be valuable as that of an impassionate scholar and enquirer into the profoundest problems of the human mind. We are confident that the conclusions drawn from Prof. Weber's proposition will prove him to be in harmony with the aim and work of THE OPEN COURT. We call special attention to the fact that Prof. Weber does not mention the belief in the Unknowable, or in anything supernatural among the essential features of religion. The words supernatural, and unknowable do not even occur in his pamphlet; and yet the subject is treated exhaustively, although in a concise form, and covers the whole ground of all that can be considered as general features of religion. P. C.

#### PARABLES.

TRANSLATED FROM THE ARABIAN BY HENRY BYRON.

#### THE BOOK OF JOB.

My father who, besides Arabian, also knew Persian and Hebrew, had a favorite book, the Hebrew book of Job. The mysterious depth, the overwhelming grandeur, the poetical sublimity of this marvelous book made an extraordinary impression on the thoughtful and, at the same time, deeply-feeling man.

He had been for some time past particularly devoting himself to the study of this book, when I (then seven years old) was seized by a sickness from which I recovered so slowly, that I was kept from going to school for the length of a half a year.

Now, whether it was that father was so full of his subject, that he could not refrain from imparting some of it even to me, the young boy; or whether it was that, at the beginning, he only wanted to make me acquainted with the two first chapters of the book, which are well adapted to a child's comprehension— suffice it to say, that he began explaining his favorite book to me and continued to do so from day to day until I had entirely recovered and could again attend school, by which time we had arrived at the close of the seventeenth chapter. These seventeen chapters I had learned so attentively and joyfully, that I could recite them by heart. Had not father given himself all possible pains to make the sublime contents accessible to my childish understanding? Had not his face beamed with joy while instructing me? How could I be otherwise than diligent? How would it have been possible for me not to catch a spark of his glowing enthusiasm?

At that period (on a beautiful sunny day, but which, for father, proved a very dark day indeed), father lost a dear friend. He took me with him to the funeral, and I can still see the picture the cemetery presented on that day: the numberless gray tombstones surrounding us on all sides; the crowded multitude as pale, still, and immovable as the tombstones themselves, but especially the Iman who, looking as if transfigured, and pointing to the new grave on which the sunbeams fell, exclaimed enthusiastically: "Look, the sun shines on the grave; the graves of the earth are not dark, are not without hope; for heavenly light and heavenly comfort reach even down to them."

On our way home (father walking slowly and silently and leading me, as was his custom, by the hand) the Iman joined us. For a long time neither of them spoke. The Iman did not try to console his friend, well knowing that consolation may soothe the heart when already healing, but not while yet bleeding from fresh wounds;—and father was entirely absorbed in his grief. At last father said to me: "Come, my child, into our midst and recite to us the fourteenth chapter of the book of Job. Speak in a loud and clear voice! I will hear every word of it." I began:

"Man born of woman, is of few days and full of trouble. He cometh forth like a flower and is cut down; he fleeth as a shadow and continueth not. And dost thou, (God), open thine eyes upon such a one, and bringest me into judgment with thee," and so on to the end of the chapter.

Such words at such an hour, coming as they did from the

mouth of a child, must have had a powerful effect, for, looking up to the Iman, I saw that his eyes were wet with tears. I dared not then look up to father until, an hour later, we entered our house.

#### THE KISS.

One day I sat at school, and my little three year old brother who was sometimes allowed to accompany me thither, sat beside me with an expression in his large, earnest eyes, as if fully understanding everything that was being taught, when suddenly one of our servants, with tears in his eyes, entered and called us home. Arriving there, we were taken silently to the large room, and, there on the floor, lay the dead body of grandfather all covered with a pall, except his face. Many people were standing about, but there reigned such stillness, as if there was no one by: Death is silent and solemn, and men become so, too, in his august presence.

One of those assembled, a venerable old man, took my little brother in his arms and, bending down low with him, made him kiss grandfather. Then, in a voice which is still re-echoing in my heart, the old man said:

"As by the kiss, which the child gave to the deceased, life's beginning and life's end met and touched, as it were; so meet and join the end of passing life and the beginning of life eternal. There is no death: he who has ceased to live, has been born to life everlasting."

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XXIII—Continued.

Laura went at once to the Professor, whom she found in his study, and asked in a merry voice if he could not aid her in playing a joke upon her kind-hearted, yet unmanageable, neighbor. "He collects all sorts of antiquities," she said, "and I should like to get him something rare that he would like. But nobody must know that I have anything to do with it, himself least of all."

The Professor promised to think of something.

Some time afterwards he placed in Laura's hands a small torn volume, that looked reduced to a pitiful state. "They are single copies of old popular songs," said he, "that at some time or other have been bound together. I hit upon them by a lucky accident. The little book is valuable; to the amateur its worth is beyond proportion greater than the price. Do not be disturbed at its bad appearance. Fritz will take out the separate songs, and arrange them in order in his collection. I am convinced you could not make him a present that would please him better."

"He shall have it," said Laura, contented, "but he shall suffer for it nevertheless."

It was a fine collection: there were some very rare pieces among them, an entirely unknown edition of the ballad of the unfortunate Knight Tanhäuser, the ballad of the Robber Toss Bowl, and a great many other charming selections. Laura carried the book upstairs, and carefully cut the thread of the bound sheets, which held them loosely together. She then sat down to her writing-table, and commenced an anonymous correspondence, which was made necessary by her father's tyranny, writing the following in a

disguised hand: "Dear Doctor, an unknown person sends you this song for your collection; he has thirty more like these, which are intended for you, but only on certain conditions. First, you are to preserve towards every one, whoever it may be, inviolate secrecy in the matter. Secondly, you are to send for every poem another written by yourself, on any subject, addressed to O. W., at the Post-office. Thirdly, if you are willing to agree to this compact, walk past No. 10 Park street, with a flower in your button-hole, about three o'clock in the afternoon on one of the next three days. The sender will be exceedingly gratified if you will enter into this pleasantry. Truly Yours N. N." The song of Robber Toss Bowl was enclosed with this letter.

It was five minutes after nine by the Doctor's watch, which was confirmed by later investigations, when this letter was brought into his room; the barometer was rising; light, feathery clouds floated across the sky, and the moon's pale crescent shone forth from among them. The Doctor opened the letter, the green-tinted paper of which contrasted with the old printed sheet, yellow with age, that accompanied it. He unfolded the yellow sheet hastily, and read:

"Storbecker und Godecke Michael,  
De rowten alle heede."

"Godecke Michael and Toss Bowl, Knight,  
They fought all day and they fought all night."

There was no doubt it was the original low German text of the famous ballad, which had hitherto been lost to the world, that lay bodily before him. He was as pleased as a child with a Christmas-box. Then he read the letter, and when he came to the end, he read it again. He laughed. It was clearly all a roguish jest. But from whom? His thoughts turned first to Laura, but she had only the evening before treated him with cold contempt. It was not to be thought of, and such playful mischief was very unlike the Professor. What did the house No. 10 mean? The young actress who lived there was said to be a very charming and enterprising young lady. Was it possible she could have any knowledge of folk-songs, and the Doctor could not help thinking, a tender feeling for himself? The good Fritz chanced to step before the mirror for a moment, and he at once uttered an inward protest against the possibility of such an idea, and, laughing, he went back to his writing-table and to his popular song. He could not enter into the pleasantry, that was clear, but it was a pity. He laid the Robber Toss Bowl aside, and returned to his work. After a time, however, he took it up again. This valuable contribution had been sent to him, at all events, without any humiliating condition; perhaps he might be allowed to keep it. He opened a portfolio of old folk-songs, and placed it in its order as if it had been his own. Having laid the treasure in its proper place,

\* Translation copyrighted.

he restored the portfolio to the bookshelf, and thought, it is a matter of indifference where the sheet lies.

In this way the Doctor argued with himself till after dinner. Shortly before three o'clock he came to a decision. If it was only the joke of an intimate acquaintance, he would not spoil it; and if there had been some other motive, it must soon come to light. Meanwhile, he might keep the document, but he would not treat it as his own possession till the right of the sender and his object was clear. He must, in the first place, communicate this view of the case to his unknown friend. After he had made the necessary compromise between his conscience and his love of collecting, he fetched a flower out of his father's conservatory, placed it in his button-hole, and walked out into the street. He looked suspiciously at the windows of the hostile house, but Laura was not to be seen, for she had hid behind the curtains, and snapped her fingers at the success of her jest when she saw the flower in his buttonhole. The Doctor was embarrassed when he came in front of the house appointed. The situation was humiliating, and he repented of his covetousness. He looked at the window of the lower story, and behold! the young actress was standing close to it. He looked at her intelligent countenance and attractive features, took off his hat courteously, and was weak enough to blush; the young lady returned the civility tendered by the well-known son of the neighboring house. The Doctor continued his walk some distance beyond; there appeared to him something strange in this adventure. The presence and greeting of the actress at the window certainly did not appear to be accidental. He could not get rid of his perplexity; only one thing was quite clear to him, he was for the present in possession of the ballad of the Robber Toss Bowl.

As his qualms of conscience did not cease, he debated with himself for two days whether he should enter upon any further interchange of letters; on the third he silenced his remaining scruples. Thirty ballads, very old editions—the temptation was overpowering! He looked up his own attempts in rhyme,—effusions of his own lyrical period,—examined and cast them aside. At last he found an innocent romance which in no manner exposed him; he copied it, and accompanied it by a few lines in which he made it a condition that he should consider himself only the guardian of the songs.

Some days afterwards he received a second packet; it was a priceless monastery ditty, in which the virtues of roast Martinmas goose were celebrated. It was accompanied by a note which contained the encouraging words: "Not bad; keep on."

Again Laura's figure rose before his eyes, and he laughed right heartily at the Martinmas goose. This

also was an old edition of which there was no record. This time he selected an ode to Spring from his poems and addressed it, as directed, to O. W.

The Professor was astonished that the Doctor kept silence about the book of ballads, and expressed this to Ilse, who was partly in the secret.

"He is bound not to speak," she said; "she treats him badly. But as it is he, there is no danger in the joke for the bold girl."

But Laura was happy in her game of chess with masked moves. She put the Doctor's poem carefully into her private album, and she thought that the Hahn poetry was not so bad after all; nay, it was admirable. But even more gratifying to her sportiveness than the correspondence, was the thought that the Doctor was to be forced into a little affair of sentiment with the actress. When she met him again at Ilse's, and one of those present was extolling the talent of the young lady, she spoke without embarrassment, and without turning to the Doctor, of the curious whims of the actress, that once, when an admirer, whom she did not like, had proposed to serenade her, she had placed her little dog at the window with a night-cap on, and that she had a decided preference for the company of strolling apprentices, and could converse with them in the most masterly way in the dialect of her province.

The unsuspecting Doctor began to reflect. Was it then really the actress who, without his knowing it, was in correspondence with him?

This gave Fritz a certain tacit respect for the lady.

Once when Laura was sitting with her mother at the play watching the actress, she perceived Fritz Hahn in the box opposite. She observed that he was looking fixedly through his opera-glass at the stage, and sometimes broke out in loud applause. She had evidently succeeded in putting him upon the wrong track.

Meanwhile he discovered that the unknown correspondent knew more than how to write addresses. Laura had looked through the songs and studied the text of the old poem of the Knight Tanhäuser, who had lingered with Venus in the mountain, and she sent the ballad with the following lines:—

"While reading through this song I was overcome with emotion and horror at the meaning of the old poetry. What, in the opinion of the poet, became of the soul of poor Tanhäuser? He had broken away from Venus, and had returned penitent to the Christian faith; and when the stern Pope said to him, 'It is as little possible for you to be saved as for the staff that I hold in my hand to turn green,' he returned to Venus and her mountain in proud despair. But afterwards the staff in the hands of the Pope did turn green, and it was in vain that he sent his messengers

to fetch the knight back. What was the singer's view of Tanhäuser's return to evil? Would the 'Eternal love and mercy' still forgive the poor man, although he had for the second time surrendered himself up to the temptress? Was the old poet so liberal-minded that he considered the return to the heathen woman as pardonable? Or is Tanhäuser now, in his eyes, eternally lost? and was the green staff only to show that the Pope was to bear the blame? I should be glad to hear your explanation of this. I think the poem very beautiful and touching, and, when one thoroughly enters into its spirit, there is powerful poetry in the simple words. But I feel much disturbed about the fate of Tanhäuser. Your N. N."

The Doctor answered immediately:

"It is sometimes difficult, from the deep feeling and terse expressions of olden poetry, to understand the fundamental idea of the poet; and most difficult of all in a poem which has been handed down for centuries by popular tradition, and in which changes in the words and meaning must certainly have taken place. The first idea of the song, that mortals dwell in the mountains with the old heathen gods rests on a notion which originated in ancient times. The idea that the God of Christians is more merciful than his representative on earth has been rooted in Germany since the time of the Hohenstaufens. One may refer the origin of the poem to that period. It probably attained the form in which it is now handed down to us, about the middle of the fifteenth century, when the opposition to the hierarchy in Germany was general, both among high and low. The grand idea of this opposition was that the priests cannot forgive sins, and that only repentance, atonement, and elevation of the heart to God can avail. The copy which you have so kindly sent me, is of the early period of Luther, but we know that the song is older, and we possess various texts, in some of which it is more prominently set forth that Tanhäuser after his second fall might still trust in the divine mercy. But undoubtedly in the text you have sent me the singer considers poor Tanhäuser as lost if he did not liberate himself from the power of Venus, but that he might be saved if he did. According to popular tradition he remained with her. The great and elevating thought that man may shake off the trammels of past sin may be discovered in this poem, the poetical value of which I place as high as you do."

When Laura received this answer,—Gabriel was again her confidential messenger,—she jumped up with joy from her writing-table. She had with Ilse grieved over poor Tanhäuser, and given her friend a copy of the poem; now she ran down to her with the Doctor's letter, proud that, by means of a childish joke, at which Ilse had shaken her head, she had en-

tered into a learned discussion. From this day the secret correspondence attained an importance for both Laura and Fritz which they had little thought of in the beginning; for Laura now ventured, when she could not satisfy herself on any subject, or took a secret interest in anything, to impart to her neighbor thoughts which hitherto had been confined to her writing-table, and the Doctor discovered with astonishment and pleasure a female mind of strong and original cast, which sought to obtain clear views from him, and unfolded itself to him with unusual confidence. These feelings might be discovered in his poems, which were no longer taken out of the portfolio, but assumed a more personal character. Laura's eyes moistened as she read the pages in which he expressed in verse his anxiety and impatience to become acquainted with his unknown correspondent. The feeling evinced in his lines was so pure, and one saw in them the good and refined character of the man so clearly that one could not fail to place full confidence in him. The old popular songs, in the first instance the main object, became gradually only the accompaniments of the secret correspondence, and the wings of Laura's enthusiastic soul soared over golden clouds, whilst Mr. Hummel growled below and Mr. Hahn suspiciously awaited fresh attacks from the enemy.

But this poetical relation with the neighbor's son, which had been established by Laura's enterprising spirit, was exposed to the same danger that threatens all poetic moods—of being at any moment destroyed by rude reality. The Doctor was never to know that she was his correspondent,—the daughter of the enemy whom he daily met, the childish girl who quarreled with him in Ilse's room about bread and butter and almonds. When they met, he was always as before the Doctor with the spectacles, and she the little snappish Hummel, who had more of her father's ill manners than Gabriel would admit. The sulking and teasing between them went on every day as formerly. Nevertheless, it was inevitable that a warm feeling should sometimes beam in Laura's eyes, and that the friendly disposition with which she really regarded the Doctor should sometimes be betrayed in a passing word. Fritz, therefore, labored under an uncertainty over which he secretly laughed, but which, nevertheless, tormented him. When he received the well-disguised handwriting he always saw Laura before him; but when he met his neighbor at his friend's she succeeded, by mocking remarks and shy reserve, in perplexing him again. Necessity compelled her to this coquetry, but it acted upon him each time like a cold blast; and then it struck him, it can not be Laura,—is it the actress?

(To be continued.)

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. I, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. Katzenjammer is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to Katzenjammer. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer's-band was that of Cataline! What Katzenjammer was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

C. K. WHIPPLE.

"Progressive Orthodoxy," by C. K. Whipple, in No. 25, is a very keen and rather sarcastic satire on "The American Board of Commissioners for Foreign Missions." The said "Board" declined to comply with the request of their missionaries to make a few changes in the plan of saving the savages. These innocents, it was experienced, object in an absurd benevolence to the plan of eternal damnation, so as to be lost for Christianity. Mr. Whipple, it seems, did not consider that the Board could not have acted otherwise, for it would have been an outright confession that the savages had converted the missionaries, a most illogical and very improper thing to do.

GUSTAV FREYTAG.

Commencing with No. 22 is a philosophic novel by Gustav Freytag. In this refined and interesting story the reader becomes acquainted with some strongly marked personalities, and hears from them some rich and rare philosophy. "What is the object of philosophy?" says Frau Rollmans to the Professor.

"It endeavors to instruct men in the life of their own spirit, and thus to strengthen and improve them."

In the actions, conversation, and adventures of the characters we see this philosophy guiding, teaching and improving them and us. Here through the easy and pleasant method of novel reading we learn the secret inspiration which produces those wonderful phenomena, which hitherto have been considered the mysteries of life; here we see destiny directed and controlled by law, and all the phenomena of natural and physical life are comprehended as phases of one and the same. This monism or conception of the oneness of all life and all nature pervades all pages of this wonderful work of fiction.

GEN. M. N. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 20 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in Its Relations to Evangelical Religion. By B. F. Underwood. Prof. P. A. Chadbourne and Prof. A. A. Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
Messiah's Expectations. By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Janes. Price, 10 cents.  
Social Ideals. By David A. Wasson. Price, 10 cents.  
The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Grumbine. Price, 15 cents.  
A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,  
TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

### INSTRUCTION.

The undersigned receives into his family young foreigners who are desirous to acquire a thorough knowledge of the German language. Two or three gentlemen only will be admitted.

The teaching of the German language in its application to mathematics, history, geography and mercantile correspondence is given at home by the undersigned; the more advanced pupils will be allowed to attend lectures at the Polytechnic School or they can enter the College or Real College of the town.

Terms for board, lodging, and tuition: \$600. per annum; no extras, washing excepted.

Terms for pupils under 15 years of age: \$500 p. a. Payment quarterly in advance and three months' notice of removal.

DARMSTADT, May 1884.

### Recent Contributions to 'The Open Court.'

THE FOUNDING OF OUR RELIGIOUS FREEDOM.

By MONCURE D. CONWAY.. In No. 52 and 53.

Mr. Conway here discusses a subject that the present Centenary Era renders timely and interesting. The glorious immunities of civil liberty that our ancestors wrested from the grasp of feudal

traditions and confirmed by constitutional bulwarks, were attended perhaps with greater brilliancy and marked by greater effort of acquisition; but, from the standpoint of individual freedom, liberty of conscience and the principle of religious toleration rank not below them in importance. Mr. Conway's story is drawn from unpublished sources, from private manuscripts, and is in the main the result of original research. The state of the Church of England in Virginia, the apostolate of Samuel Davies, the religious tendencies of colonial society, the religious profession of men to become so famous in history, of Randolph, of Patrick Henry, of Madison, and of Jefferson—are all described and discussed, and the manner told in which both the institutions and the men of that era affected and influenced the founding of religious freedom in the United States. The new light which Mr. Conway's research throws upon this important chapter of American history, will be welcomed by all.

### THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET.....In Nos. 49, 50 and 51.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to their world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays will be published at the conclusion of the series.

The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

### REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

Mrs. EDNA D. CHENEY.. In Nos. 49 and 50.

In Nos. 49 and 50 *THE OPEN COURT* publishes a paper upon Mr. Alcott's conversations, read by Mrs. Edna D. Cheney before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1840. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

### PRESS NOTICES.

"Full of novel thought."—*Chicago Herald*.  
"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The absurdity of the theory is manifest."—*New York Science*.

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

"The world-wide reputation of its author, as the greatest living authority on philosophical subjects, is enough to command the careful perusal and respectful consideration of all who may take up this little book."—*Chicago Legal Advertiser*.

## THE OPEN COURT.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Menism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social, and economic questions.

## THE OPEN COURT.

(Nixon Building, 175 La Salle Street.)

P. O. DRAWER F. CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the

idealist to deny the existence of matter. The materialist beholding the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

MORRISON I. SWIFT.

In No. 23 **Morrison I. Swift** makes a vigorous appeal to the churches that they become actively interested in what is generally known as "The Social Problem," and that they take the lead in Christianizing the people after the manner practiced by Jesus in Judea and by his disciples, as related in the New Testament. Mr. Swift's language is clear, eloquent, pervaded by an ideal humanitarianism, and is not only respectful to the clergy but even reverent. He thinks the opportunities of the present and the future are in the hands of the churches, and that the clergy may lead the van of social progress instead of trailing along behind the baggage wagons, as they have so long been contented to do. "In this country," he says, "where the church has the allegiance of so large a portion of the people, where it represents a large proportion of the specially organized moral forces of the land, where finally its material resources are almost unlimited and the money power of the country is its friend and supporter, it would be possible for the church to bring about the reform that is needed, with little difficulty, if it desired to do so." Here Mr. Swift is confronted with the important objection that should the church take the lead in the social revolution or even in social reformation so far as "to establish such fair distribution of the products of human industry that superabundance and luxury will not exist," the "money power of the country" would cease to be its "friend and supporter" and the clergy might cease to be a priesthood. He presents the difficulty thus: "It is said by some that the pulpit will not go much beyond those who maintain it. This is to acknowledge that the opinions of the clergy are to-day bought and paid for, just as lawyers are hired and legislators sent to uphold the ideas of their constituency." Notwithstanding this difficulty, Mr. Swift sees "a slumbering lion in the Christian ministry, which will, ere long, awaken and put forth its formidable powers for the poor and the oppressed."

Two other essays by Morrison I. Swift, are contained in Nos. 32 and 44. In the one he speaks of *The Scholar as a Reformer*, and in the other of *The Masses as Reformers*. The scholar has imbibed something of the historic spirit; he perceives, moreover, that the change in human institutions must ever be along the line of the moral and the ideal. Life can not be conceived in its full import, until the individual comprehends himself as the bearer of the rare essence and as containing, in no merely figurative way, the temporal hereafter. It is the mission of the scholar to reveal the larger and encompassing world of his soul, not of the bookish professional scholar but of him who has sought a profound comprehension of the meaning of life in its complexity and breadth. He must guide the masses, he must clear away the mystifying creeds and establish the truth that all men are born to live moral and beautiful and expanding lives in whatever sphere they may labor.

Mr. Swift considers the masses as the raw material for reform. There are rich people who think that general betterment means loss to them. But to dread reform is to misunderstand. Whatever is imperfect in society is injurious to all classes. A reform at one point reaches every point. The essayist sets great hopes on the masses—indeed, hopes too great, which may prove illusions. "Their minds," he concludes, "are more fluid and therefore they are more capable of growth into a surviving harmony with the conditions of life than those whose adaptations were formed earlier and in less enlightened times. . . . They are to become an infinitely more important factor in the life of the race than ever before." . . .

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. BINET.

*Translated from the "Revue Philosophique" by HENRI.*

PART IV.

II.

### NUTRITION.

After studying the organs, let us pass to a study of their functions.

It is not our intention to devote special chapters to irritability, instinct, memory, reasoning, and the powers of volition in Micro-organisms. This would lead to diffuseness of treatment. Our method will be quite different. We shall describe as a whole all the different manifestations of psychical activity attendant upon the actions of Micro-organisms in the exercise of the important functions of their existence. The present chapter will be devoted to psychical phenomena connected with the act of nutrition.

All living matter possesses the power of continually increasing its mass by the inward reception of materials, and of simultaneously decreasing the same through the combustion of its substance with the oxygen of the atmosphere. The first of these processes is called nutrition, and the second, respiration.

We shall first examine the psychical phenomena which precede and determine the act of respiration. These phenomena are often very simple and of little significance. If the Micro-organism lives in the water, which is most frequently the case, the oxygen contained in solution therein passes directly through the cellular cuticle by dialysis and comes in contact with the body of the protoplasm; in which case the process of respiration is solely a chemical phenomenon. But it may happen that a minute organism chanches into a medium containing little or no oxygen-gas; amid these new conditions where it becomes necessary to move towards sources emitting oxygen by voluntary effort and directed motion, it has been discovered that a great number of Micro-organisms, and particularly Bacteria, are capable of detecting the expansive power exerted by oxygen in the liquids in which they are found. When bacteria of putrefied matter are put in a drop of water containing no oxygen but in which have been placed chlorophyll algæ, or green Euglenæ, or grains of chlorophyll obtained by

crushing green cellules, nothing happens in the first instant; but if the preparation be illuminated so as to allow the chlorophyll to act, the bacteria are seen to exhibit very rapid movements and to proceed, all together, towards the points of the preparation where the generation of oxygen is taking place, that is to say, about the grains of chlorophyll. Under these conditions a chemical exchange is instituted between the chlorophyll and the aërobious Bacteria: the Bacteria disengage carbonic acid gas and absorb oxygen; the chlorophyll fastens upon the carbon of the acid and sets the oxygen at liberty. If the preparation be darkened the Bacteria cease assembling about the chlorophyll grains, which, hid from the light, cease to disengage oxygen. The clustering begins anew, if a ray of sunlight is again let touch the chlorophyll.

Analogous facts have been observed under circumstances somewhat different. In a preparation from the intestines of a silk-worm, M. Balbiani has seen Bacteria which were uniformly distributed throughout all points of the preparation, gather about the green and undigested cellules of the leaves contained in the intestines, and bury themselves in them as if to partake of them. In other instances, the same naturalist has observed that Bacteria developed in a drop of silk-worm's blood, would gather, after a while, about the globules of the blood; undoubtedly for the purpose of seizing the oxygen being absorbed by them.

Upon the basis of these facts M. Engelmann has established the method called the Bacteria method. He regards bacteria as a living reagent which enable us to reveal the trillionth part of a milligram of oxygen, that is to say, a quantity scarcely greater, according to the calculations of physicists, than a molecule. This curious method enables us to explain biological problems which had hitherto remained unsolved. Before this, it was not known whether the colorless protoplasm of green plants could or could not disengage oxygen. It is now known, thanks to the bacteria, that grains of chlorophyll are the only points about which the liberation of oxygen takes place. The same method has enabled us to prove, in the variegated plants, that the maximum liberation of oxygen coincides with the maximum absorption of light. Thus, in the case of green algæ, the red and the violet colors of the spectrum are the spots where the bacteria ac-

\* Translation copyrighted

cumulate the thickest; consequently here is where the liberation of oxygen is greatest. Now, these colors correspond to the lines of greatest absorption in the spectrum of chlorophyll. In the case of brownish yellow cellulose, the maximum action is in the green; in the case of bluish green cellulose, in the yellow; in the case of red cellulose, in the green. The author has concluded from this that there exists a series of coloring substances which, like chlorophyll, have the power of resolving carbonic acid gas; he calls them chromophylls. In the same way, moreover, this method enables us to solve the question of the distribution of energy in the solar spectrum. As M. Engelmann has remarked, it is interesting to see the Bacteria come to confirm our theories as to the composition of solar light.

Bacteria are not the only organisms that eagerly make towards points where oxygen is to be found. A large number of other Micro-organisms act in the same way when they happen into a medium lacking oxygen. M. Ranvier has noticed that if a preparation containing leucocytes, screened from air, be examined for a certain length of time the cellulose will be seen to throw out long filaments towards the part that faces the air-side of the preparation. It appears, then, that a rudimentary oxygen-sense exists in the protoplasm of Proto-organisms.

This sense does not merely apprise the organism of the presence of oxygen; it enables it, further, to gauge the tension (expansive power) of the gas. So that, when the tension becomes too powerful, the organisms are seen to flee before it.

(To be continued.)

#### THE PROBLEM OF CAUSALITY.

Causality, the law of causation, is the basis of all our experience, and a clear conception of causality is indispensable to correct observation as well as to sound reasoning. In spite of this, the problem of causality has been unbecomingly neglected; the vagueness of terms, the lack of lucidity, and the innumerable errors springing from such uncertainty are astounding. Expressions such as 'first cause,' 'ultimate cause,' 'final cause,' 'remoter cause,' 'general cause,' 'universal cause,' '*causa sui*' are in vogue among thinkers of no inconsiderable repute. In elucidating the problem, we shall first propose a few examples, then our definitions, then some explanations, and finally discuss the erroneous conceptions of causality.

#### EXAMPLES.

I. A sculptor is modeling in clay; after much pressing, trimming, and finishing, a figure is shaped. The form of the statue is the effect of his work. [Production of a new form of matter.]

II. A key on the piano is touched, the hammer

strikes the chords, and a sound is produced. The sound is called the effect. [Production of a new form of energy.]

III. A chemist brings hydrogen and oxygen together. An explosion takes place and water is produced. The water is called a product of the combination, and the form in which hydrogen and oxygen are combined in water is the effect; of which the combination (the act of combining) is the cause. [Creation of a new form of matter, being another substance and exhibiting new properties.]

IV. The trigger of a loaded gun, pointed toward a deer, is pulled. The deer is hit and dies. The pull on the trigger is the cause, and the death of the animal is the effect. [Destruction of form.]

V. During a rainless season water is poured every evening on an almost withered plant. The plant commences to thrive, it grows and sprouts, and after a while it brings forth blossoms. The plant's blossoming is the effect of its repeated irrigation. [An example from the vegetable kingdom.]

VI. A mother loving her child more than her life, observes that a lion of a menagerie is at large in the market-place. All people flee. Her baby is left behind by its nurse and the lion approaches the infant. The mother rushes out of the house and rescues her child in the face of the lion. [An example taken from human life; the story is an historical fact, known under the title of "The Mother of Florence." The cause, in this case, is the motive of the mother; the effect is the rescue of the child. The motive is mostly a very complicated state of mind, which in the present instance can be summarily characterized as a mother's desire to save her child.]

#### EFFECT.

The effect has not existed before. It has been produced by its causes. What then is the effect?

Matter cannot be created, and energy cannot be created; the effect, therefore, can only be a *new form* of matter and energy:

I. The clay of the sculptor existed before the statue; the form of the statue alone is new.

II. A sound is a special vibration of air. The air (in instance No. II) is not created nor is the motion of the air created out of nothing. The vibration of the sound is nothing but transmitted energy coming from the muscular action of the finger that struck the key. The effect, accordingly, is a special form of energy agitating the air.

III. The material elements of the water ( $H_2O$ ) existed before their combination. The water, in so far as its material particles are concerned, has not been produced. The effect of a chemical combination of  $H_2O$  can be called water in so far only as water signifies the *form* into which the elements have combined. In

common language we make no distinction between water as matter and as a combination of the two elements.

IV. The death of an animal caused by violence or by natural sickness is destruction of form. True, it is a destruction of life, but life is not a material object, not a thing of substance; life in the narrower sense (the individual life of a deer) is the spontaneous activity of a certain body; it is a form of nerve-energy. Life in the broadest sense of the word, meaning force, or spontaneity, or self-motion, with which all matter is endowed, can not be destroyed. It is indestructible, as we know from the law of conservation of energy. But life in the narrower sense is a certain combination of energy in the special form of an animal body. Death is the destruction of this form; while propagation, being growth and transmittance of form, is a continuance of the paternal form of life in offspring.

V. The blossom of a plant is not the effect of its irrigation. The matter of the blossom, the elementary particles of which the blossom consists, have existed before as water, air, and parts of the soil. And the vegetative energy stored in its cells has also existed in the shape of sunbeams or otherwise. The effect produced is this special form, in which by assimilation and transformation the organs of the plant have combined energy and matter as a blossom.

*Definition.* Accordingly effect is a new state of things: a new arrangement; a new form produced through some alteration of circumstances.

#### CAUSE.

The previous state of things, which existed before any effect was produced, cannot have been at rest. If it had been at rest, no effect would have been possible. The previous state of things must have been in motion. Without motion no causation. Motion is an alteration of place. When properly combined, the atoms of oxygen and hydrogen will shape themselves into new configurations. The cause is a motion; it is their properly meeting each other. The atoms being of a certain size and shape, and having special powers of attraction, so that they fit to one another, appear in the new form of water.

A chemist who makes the experiment has, as a matter of course, to observe all the conditions under which the process takes place.

A gardener who waters a plant must at the same time take care that the plant receives sufficient sunlight, that it stands in good soil, and is protected from injurious insects. These facts taken altogether, are called the circumstances. Circumstances in so far as they are indispensable to the realization of an effect, are called conditions

*Definition.* Cause (being the factor that produces the effect or the new state of things) is a motion. It is an alteration in a certain state of things whereby a further alteration, a re-arrangement or a new combination, becomes necessary.

#### EXPLANATIONS.

1. *Causes and Conditions.* It is obvious that if in a certain state of affairs the effect is produced by several, perhaps simultaneous, movements, we may arbitrarily call one of them the cause and the other ones its conditions, or we may call all of them together the causes. So for instance, the sunbeams (not as things, but as a motion, as ether-vibrations) may be called the cause of blossoming just as well as the watering; or we may designate both as the common causes.

2. Cause and effect are two states, the one following the other: The causal state disappears by creating the state of the effect; or in other words, the cause, vanishing as such, reappears in the effect. The same matter, the same energy are exhibited in a new form or a new combination.

3. The scholastic maxim, *cessante causa cessat effectus*, is accordingly wrong. The cause is always passed, if the effect is produced.

4. Causes and effects form an infinite chain of alterations; every cause is the effect of another cause; and every effect can become the cause of another effect. If a key on the piano is touched, a lever is set in motion which raises a hammer; the hammer strikes against the chords and sinks back; the chords vibrate according to their length and induce in the air corresponding undulations. The air-waves meet a human ear and transmit their rhythmic motions to the tympanum, thence the disturbance passes through many stations in the aural apparatus and reaches the auditory nerve where it is perceived as sound. In this and in all other chains of causes and effects, any of the succeeding stages may be called the effect of its antecedents and the cause of its consequents.

Accordingly the signification of cause and effect is to a great extent arbitrary and depends much upon the proper tact of the observer. He should select as cause and effect two states which somehow correspond to one another in importance for a special purpose. How far the intermediate links can be neglected, depends upon circumstances.

5. Our example No. III (the generation of water) is often used as an instance to prove the transcendence (or unknowability) of the law of causation. However, there is no room for mysticism if we take into consideration that the product is a new molecular form of its constituent elements. By molecular form of water, we understand the combination of  $H_2$  with O in that special form in which it appears as water.

Suppose we have a rectangle of 5 x 3, and two equi-

lateral triangles, the bases of which are 5 and the sides 3. Combine the two bases of the triangles with the longer sides of the rectangle and we will have a hexagon all whose sides are 3. The rectangle, as such, has disappeared, and the triangles, as such, have disappeared also. A new form is created, a hexagon, which has lost the properties of its component figures and possesses properties that were not exhibited in the same. The longer sides of 5 which existed in the triangles as well as in the rectangle are as such altogether lost in the hexagon. The hexagon is equilateral and has six obtuse angles, while the triangles have two acute, the rectangle four right angles, and neither the triangles nor the rectangle are equilateral.

Some imagine that the properties of a combination must have before existed in a latent form; but in our geometrical instance this is evidently impossible. The hexagon is an entirely new form, which has neither existed in the one nor the other of its components. If such is the case in this extremely simple instance, how much the more is it true of the highly complicated combinations and changes of form in reality, which by the smallness of atoms are not directly observable, and can often only be guessed or traced with greatest difficulty!

It is a fact which is overlooked by great thinkers that by combination or change of form things can be created which never existed before in that form, and the qualities of which can neither as latent nor as apparent properties be traced in their constituents.

6. Materialism overlooks the importance of form. While justly opposing the wrong conception of any immaterial existence, materialism goes too far when it considers matter as the only aspect of phenomena, thus making it the sole principle of explanation. Mr. Spencer tries to reduce everything to matter and motion, and Professor Louis Büchner similarly proposes his philosophy of *Kraft und Stoff*. In this way they fail to see that evolution, progress, the occurrences of inorganic nature as well as the highest aspirations of man, can only be explained from the fact that new combinations or new forms are actually new creations.

It is undeniable that immaterial realities can not exist. The thing exists by its being material; and its reality is manifested by its being a combination of energies; it is a *Kräfte-Complex*. But the thing exists *as such*, because it has a certain form. Destroy the form

and the thing as such ceases to exist and changes into something else.

Diamond, graphite, pure coal, and soot, so far as their material constituents are concerned, are the same; all being carbon. And yet they are radically different things, with different properties. Diamond is as white and clear as water and as translucent as air. It is the hardest substance known in nature. Coal, graphite, and soot are of the deepest black, and are soft enough to leave dark, lead-colored traces on paper. Diamond is rare and valuable, while the other formations of carbon abound in nature. The difference of these simple substances is exclusively one of form.

Combinations of the same chemical composition, with different properties, are called isomeric. For instance, the formula  $C_2H_4O_2$  represents acetic acid as well as methyl ether of formic acid, the former being an acid the latter a neutral substance. The boiling point of acetic acid is almost  $90^\circ$  higher than that of the methyl ether of formic acid, and with same substances the one forms other combinations than the other. Grape sugar, being  $C_6H_{12}O_6$ , consists of the same elements in the same proportion also. Quite different from the other two substances, it is sweet, crystalline, capable of fermenting, and neutral to litmus paper. It is neither an acid, a base, nor a salt.

Graphic formulas\* have been invented in order to give a visible expression to such differences.

Consequently a thing, a body, a substance, is not only the sum total of its material elements, it is the *form* of its material elements. Materialism is right in so far only as it maintains that things exist at all because they are material; but it must be remembered that they exist *as such* because they have a certain form. Form, so to say, is the soul of things.

The same is true of man. Man is not only an aggregate of matter and energy; he is an aggregate of matter and energy in a *special form*. And it is the form which makes him a man. Prof. Büchner says: †

"The greatest of all poets who has ever lived and whose masterpieces are immortal, because he stood upon this ground of truth and reality, *Shakespeare*, was already a Materialist in his

\* The elements differ in atom-fixing power. An atom of hydrogen, being able to attach to one atom of any other substance, is called a monad, which is expressed by H'; an atom of oxygen is a dyad, O''; nitrogen a triad, N'''; carbon a tetrad, C'''' or C<sup>IV</sup>. The graphic formula for water is: H—O—H.

Propionic acid, Methyl acetate, and Ethyl formate (all three being  $C_3H_6O_2$ ) are, as their names suggest, entirely different substances. They have been expressed by graphic formulas in the following way.

† "Materialism, Its History and Its Influence upon Society." New York: The Truth Seeker Co.

innermost convictions, and with his prophetic eye pursued the eternal wanderings of matter as the last and primitive cause of everything that exists, through the same pathways, upon which modern science has traced it with mathematical certainty, when he says (Hamlet, v. 1):

Imperious Caesar, dead and turned to clay,  
Might stop a hole to keep the wind away;  
O! that the earth that kept the world in awe,  
Should patch a wall to expel the winter's flaw!"

In the bible God says to man: "Dust thou art and unto dust shalt thou return." So, God must have been "already a materialist in his innermost convictions." But this biblical utterance is only one side of the truth, it is the one-sided truth propounded by materialism. The other side of the truth is, that man as such is form; and form is changeable; it can be evolved, and this evolution of form is the purpose of our life, the ideal of our aspirations and the basis of ethics.\*

#### WRONG CONCEPTIONS OF CAUSALITY.

1. Cause is an alteration in a state of things and effect is a new arrangement of things. But cause and effect are never objects or things. A thing by its motion or a person by his labor may produce an effect; but the thing itself or the person is never a cause, nor is the thing produced an effect. A sculptor may carve a statue; the sculptor is not the cause, and the statue as a thing is not the effect. The sculptor's labor is the cause; and the effect is the special form of the wood, clay, stone, or bronze, *i. e.*, the statue without reference to its material.

2. God has been called 'first cause.' First causes are of mere relative existence. A first cause is the starting-point in a series of some longer chain of causes and effects. The first cause in our second example is the touching of the key; all the effects of this cause are later causes in the series. According to the nebular hypothesis of Kant the first cause in the formation of our planetary system must have been an unequal distribution of matter. This state of things happened many billions of years ago, and has passed away, as any cause must disappear when its effect has resulted.

'Ultimate cause' is a synonym of 'first cause.' The first term becomes the ultimate one if we count backwards. The expression 'ultimate cause' is even more unfortunate than first cause.

3. Hume speaks of 'general causes,' meaning thereby natural laws. The Germans distinguish between *Grund* and *Ursache*. *Ursache* is what we have defined as cause; *Grund* is the law by which we explain why the cause acts. *Grund* is the *raison d'être*, the reason, the principle, the law according to which things change or move, and according to which men act. For instance, gravitation is not the cause that a stone falls to the ground. The cause may be

that my fingers let it go. Gravitation is the *raison d'être* of a stone's fall in this particular instance as well as in any other case. A cause is a single event, a single fact, a certain motion or alteration. The *raison d'être* of gravitation, however, is a general law and a principle of explanation.

Those who call God the first cause really mean to call God the ultimate ground of the world; they intend to represent him as the most comprehensive principle of existence; as the ultimate generalization of all laws.

4. The scholastic dictum, *cessante causa cessat effectus*, which is quoted above as wrong, refers to this *raison d'être*. It should read, *cessante ratione cessat causatio* *i. e.*, if the ground or reason, the rationale, ceases to be valid, the cause cannot take effect. For instance, love of freedom was the *raison d'être* of Greek industry, progress, and civilization. As long as this love of freedom prevailed, Greece was free, prosperous, advancing, and civilized. As soon as this love of freedom yielded to indifference, avarice, and other vices, Greece began to decline. It was a ground but not a cause—it was a continuous principle which manifested itself in many single cases. So the law of gravitation is no cause, but a law recognized in many instances and regulating the causation of gravitational objects.

5. The *causa sui* of Spinoza is one of the worst self-contradictions in existence, designating "a cause which is the cause of itself." Spinoza apparently means *ratio sui*, a reason or principle which explains itself; a ground which has its ground in itself, meaning a self-evident truth that for verification does not depend upon some other evidence. Spinoza confounds this *ratio sui* with the idea of an absolute existence; *i. e.*, an existence which contains in itself the ground or *raison d'être* of its existence. On this logical error rests the whole structure of his grand and noble philosophy.

6. 'Final cause' is a most unfortunate expression for purpose. The schoolmen distinguished 'effective causes' and 'final causes.' It is obvious that all causes are effective. If a certain cause is the will of a man, the idea which guides him is an indispensable condition. This idea is the end to be attained. If such causes are to be called 'final causes,' we must bear in mind that these 'final causes' are just as much effective causes as any others. There is no essential difference. Both result into their effects with the same necessity.

Final cause being an inappropriate synonym of purpose, has only sense when it is used in reference to a will. We cannot speak of the final cause of cereals as being serviceable food for man. There is no final cause in nature outside of the province of volition.

\* Compare Mr. E. C. Hegeler's essay, "The Basis of Ethics," in No. 1 of the OPEN COURT, and the editor's pamphlet, "Monism and Meliorism," V., §59.

7. *Causality immanent.* The 'world no chaos, but a cosmos.' Those who use the word 'final cause' in a more general sense, imagine that a divine providence has arranged the order of things according to some plan or design. They consider the universe by itself as chaotic, and believe that God imposed law and order upon it from the outside.

Materialism, denying altogether the existence of final causes and design in nature, falls into the same error as its enemy, dualistic superstition. Materialism also considers the universe as originally chaotic, and explains the order of the world as the fortuitous outcome of haphazard, which if once happily arranged has necessarily more stability and more chance to continue so than other, chaotic formations. This view disagrees with facts. The relatively chaotic combinations of lower natural manifestations are more stable than the higher evolved forms of life, the highest forms being least stable.

Monism teaches that the order of the universe is not transcendent; it is not imposed upon nature from the outside; the order of the world in its mechanical regularity is immanent. The world is no chaos, it is a cosmos, and if God is to be called the order of the universe, monism teaches that God is immanent; God and the universe are one.

8. *Order not fortuitous, but necessary.* The truth that the creations of nature, planetary systems as well as organisms, the organs or limbs of animals and plants, etc., are necessary and not fortuitous results, does not stand in contradiction to the fact that nature before realizing the relative perfection of a certain formation has to meet with many failures. These failures are the stages on the highroad of creation and are as such the indispensable conditions of a final success.

Organs perform certain functions. These organs have neither been devised by a provident demiurge, nor did they originate by chance. Comparative physiology has proved beyond any doubt that every organ has been produced by its own function. A function again is the *consequens* of a want, being some readjustment or solution of a certain tension. The chemical affinity of protoplasm to oxygen and water, etc., produces, after a consumption of these materials, a kind of hunger to replace them. The hunger of protoplasm for oxygen has produced lungs and the pores of the skin, while the hunger for water and food has formed stomachs. All the many thousand trifling processes which take place from the first dimly felt want to the relative perfection of a properly working organ are necessary steps in the course of evolution.

Imagine how many billion atoms one drop of protoplasm contains! How many billion times billion

combinations of these atoms are possible, and how many more are impossible. Should nature have tried them all, or at least part of them at random, until at last she has happily hit one of the right combinations, a possible combination among the unlimited number of impossible combinations? Certainly not! The origin of life, or of protoplasm, or of any organic or any orderly arranged form, cannot be explained as a fortuitous result. One might just as well maintain that the Iliad originated by a fortuitous combination of Greek letters; and with some pretence of proof you may adduce the fact that we have evidence for several futile attempts preceding the consummation of the Iliad, being made to create national epopees in Greece; the last attempt, having happily been the right one, survived. The error of this theory is manifest. Organic life and all orderly arranged forms of nature originate by necessity according to mechanical laws, and necessarily only the better ones can survive.

Supernaturalism says: "The order of the world is the result of some wise and omnipotent providence." The demiurge has arbitrarily made the world, as it is, in monarchical fashion according to the rule, *car tel est notre bon plaisir*.

Materialism says: "Reason originates by chance from the Unreasonable." *Vernunft* must be explained from *Unvernunft*,\* order from disorder, for order is only one of the many possible states of disorder.

Monism explains order from order, and declares that the most complicated forms of order can be reduced to the most simple laws. The most difficult calculations of higher mathematics are based on the simple functions of addition and subtraction, the most abstract logical conclusions ultimately rest on man's faculty of combining and separating† his concepts, and man's thoughts as well as emotions being, physically considered, motions which take place in his brain-cells, work in accordance with certain laws. The science of the laws of motion is called mechanics.‡ Consequently, as sure as there is order everywhere, in the formation of nebulae as well as in the formation of life, man's thoughts work in accordance with mechanical laws.

In brief, the order of the world is neither a fortuitous result in a play of blind forces nor the designed wisdom of a personality like ourselves, only omnipotent in his powers; the order of the world is throughout immanent and necessary.

P. C.

\* See translation from Kant in the editorial remarks to the article "Monism and Religion," page 1206 of THE OPEN COURT.

† We prefer the expression "combination and separation" or "combination and abstraction" to Max Müller's "addition and subtraction."

‡ Mechanics, as all the other formal sciences, mathematics, arithmetic, geometry, logic, etc., cannot be employed for enlarging our experience or explaining the ultimate *raison d'être* of existence. But our experience must, throughout, conform to the because existence is throughout regulated by these formal laws.

## MONISM AND RELIGION.

A REJOINDER. BY DAVID THEOPHILUS.

With Editorial Remarks.\*

(Concluded.)

My worthy opponent Mr. E. P. Powell says, that whoever inquires into the cause of phenomena, is religious, nay, must be religious, as in this way he must come upon a first cause and a final cause or design in nature: and that Strauss, by virtue of his being a man of science, had more religion than Talmage. Doubtless, this is a novel method of looking at things. If what he says is a fact, then there cannot be meaning in words, nor truth in history. What history tells on the subject is that the scientific conception excludes the religious, and that by pursuing the scientific method men have not acquired religion, but lost what they once had.

[Mr. Theophilus, differently from Mr. E. P. Powell, uses the word "religious" in the sense of "superstitious."—Ed.]

To a man who views the world from the monistic point of view, the idea of first and final cause or design is inadmissible: for it is a conception born of dualism.

[Mr. Theophilus is correct in stating that the ideas first and final cause are untenable. For further explanation of this subject see the editorial of this number.—Ed.]

The idea of causality, doubtless, has been obtained from the consciousness of ourselves as agents. It has been got by simply projecting our own causality or personality back to the dim past, and telling it make things out of nothing or otherwise; and then name it God. But what is the use of such a fanciful creation, when its realization is unthinkable. It is not power we want. It is not will; nor is it intellect: nor anything else known to our faculties. Nothing in our line of goods will answer the purpose.

Two gaseous substances come in contact under certain conditions, and water is produced. A male and a female unite under certain other conditions, and a living being is the issue. The mind of the chemist is given credit for the one and the Divine mind for the other. But as a fact, the greatest chemist that ever lived is as ignorant of the process as the browsing ox in yon field.

[That is hard on our scientists, but it is not true. If it were true, it would be useless to take the trouble to investigate, for the browsing ox is undoubtedly happier than most men.]

[The above statement of Mr. Theophilus would be true if the agnostic dogma could be proved, that behind every knowable phenomenon there is something unknowable as its cause.]

[Should Mr. Theophilus really succeed in proving that our scientists know no more about the process of generating water from H<sub>2</sub>O than the 'browsing ox in yon field,' I shall become a convert to agnosticism and reverently bow down before the Baal of Unknowability. Agnosticism stands in opposition to theology, in so far as it is supernatural dualism. Theology declares that "the first cause" of natural phenomena is a personal being like ourselves; agnosticism says that the causes of phenomena are unknowable, but anyhow they cannot be personal. Monism knows nothing of such "unknown causes." Causation is no mysterious process and causality is the very condition of the knowability of nature. Any kind of dualism, the theological as well as the agnostic dualism, if consistent, will lead to mysticism. Here the two bitter opponents may shake hands.—Ed.]

Magnify an intellect a million fold and tell it produce one

small particle of dust, or cause one blade of grass to grow, and it will be as incapable for the feat, as the embryo that lies in the mother's womb. And yet, when certain conditions are there, the blade of grass, we all know, will come forth, and must come. There is no power in the universe to prevent it. It is under as much compulsion to grow when the conditions are present, as not to grow when they are absent. And the same is the case with dust formation.

The truth is, a man who professes himself a monist knows no first nor final cause, nor indeed causality in the true and original sense of the word, as involving the idea of a conscious self-acting agent.

[We go one step farther than Mr. Theophilus. We not only exclude "the idea of a conscious self-acting agent," we exclude all kinds of agents, also the impersonal agents which are supposed to be the mysterious unknowable in natural phenomena.—Ed.]

First and final cause are words and conceptions which belonged to the vocabulary of dualism. They did duty under the regime of theology, faith, and metaphysics; at a time when everything was explained by putting an agent, a soul, or a god behind it, and when there was no question asked as to how it got there.

A strictly man of science or monist, has no ideas corresponding to the old conceptions connected by such words as first cause, design, or final cause. The truth of this has been fully and clearly grasped by the great monistic thinkers of the past, notably by Lucretius and Spinoza. To these master thinkers, looking upon the world from the monistic standpoint, such ideas as design, final cause, God, soul, immortality, providence, religion, necessarily lost their signification. And the words no longer for them had any use or meaning. The ideas had been effaced from their mind by the larger conception which had taken hold of it.

[Spinoza attempted to change Des Cartes's dualism into a unitary conception; his system is one of the grandest philosophies ever thought out by a mortal. If he did not succeed in propounding true monism, it must be attributed to his misconception of the word "cause." The idea of God did not lose its significance with Spinoza; it was certainly not "effaced." His God is defined as *natura naturans*, as *substantia*, and as *causa sui*, which latter term is even more incorrect than "final cause" or "first cause."—Ed.]

The flickering light of the rush-candle is of use only in the dark. When the sun rises its utility is gone. Similarly, a large, comprehensive view of the world, renders all local, provisional, limited, make-shift conceptions useless; like a complicated piece of machinery superseding the use of all previous crude manual contrivances.

Lucretius saw in nature only the eternal conjunctions, separations, and interdependence of elements. And the existing order was no proof of a designing mind, but simply a special arrangement of the infinite possibilities of the combinations of the primary elements. The first elements after testing every kind of position and production possible by their mutual unions, at length settled in the form and way they now present; and preserve it, because such a position has been found on trial conducive to preservation or existence. And as was the case in brute nature, the same Lucretius found in civil societies. Order is the result of no pre-arrangement designed by the wise man, but the outcome of the conflict of wills, desires, and impulses.

It was only after the exhaustion of physical violence that order or equilibrium was obtained in nature. And it was only after traversing many false paths that mankind attained finally to the right, which, when once found, afterwards maintains itself, simply by reason of its intrinsic worth.

What is called order in both external nature and human so-

\* Lack of space prevents us from writing an editorial article in answer to this Rejoinder. The necessary replications will appear as parenthetical insertions marked by hanging indentations. The Rejoinder by Mr. Theophilus refers to the Editorial in No. 30, "Superstition in Religion and Science," and to Mr. E. P. Powell's article, "Monism and Religion," in No. 35; it was received a few weeks after the appearance of the latter, and its publication had hitherto been chiefly delayed on account of the pressure upon our columns.

ciety was simply the way wherein coexistence of particles or of individuals, is maintained. Maintenance of existence is the criterion of order. The elements or individuals might have come in contact and separated millions of times. In such cases there was no order or law; but when a permanent union was formed, there too was necessarily order.

Mankind finding permanency, and therefore order, in things during their own lifetime and that of a few of their ancestors, jump to the conclusion somebody must have made it so. Such a conclusion doubtless seems plausible enough to them from analogy of their own activity. Man as agent or person puts other things together in this or that shape to suit some previous plan; and by analogy he argues there must be somebody who placed things in the shape they now wear. But what right has he to measure the operations of the universe by his own doings? It is nothing but lack of knowledge of the actual facts that compels a man to resort to this arbitrary method of explaining things. Nevertheless it has been used universally in the lower stages of progress to explain all problems.

[The great difference between the materialistic and monistic conception of the world is, that the former considers the present order of things as fortuitous, the latter as necessary. Materialism says: "The first elements, after testing every kind of position and production possible by their mutual unions, at length settled in the form and way they now present." Monism says: "According to mechanical law they arrange themselves thus and not otherwise." Consider how many billions of other compositions of the atoms in an amœba are possible, or at least thinkable! And nature should have tried all these infinite possibilities, or part of them, before creating the amœba, and then the hydra, and then the worm, and so forth? Oh no! The order of the world is no hap-hazard effect, it is no fortuitous outcome of chaos. *There is no chaos and never has been a chaos.* Even in the gaseous nebula there is order and law, and it appears as chaos only in comparison to the more evolved state of a planetary system. Thus the barbaric stage of savage life appears to us as lacking in social order; and our present state of civilization, it is to be hoped, will appear to future generations as the chaos out of which their better arranged society emerged.

[Kant says on this subject: "The aforementioned expositors of the mechanical theory of cosmic genesis (Epicurus, Leucippus and Lucretius) derived every arrangement perceptible in the cosmic system from fortuitous accident, which caused the atoms so to hit together that they made up a well-ordered whole. Epicurus, indeed, was so presumptuous as to require the atoms to swerve from their direct motion without any cause at all, in order to be able to meet one another. They, every one of them, carried this nonsensical principle so far as to ascribe the origin of all animate creatures to this same blind concurrence of atoms, and actually derived reason from what is not reason (*Vernunft* from *Unvernunft*). In my system of science, on the contrary, I discover matter joined to certain necessary laws. In its complete dissolution and dispersion I see a beautiful and orderly whole naturally developing therefrom. This does not occur through accident or at hap-hazard, but it is seen that natural properties necessarily bring it about."

[Kant argues that this necessary order is a proof for the existence of God. We add from our standpoint that this order is God.—En.]

History for centuries has been read in the light of the final-cause theory.

The powerful king, the holy priest, and the wise legislator, each and all were agents acting with foresight and wisdom upon passive human beings, in formation of societies and kingdoms, the establishment of religions, the promulgation of laws, and the form-

ing of constitutions. The great, holy, and wise men did everything as agents; and these in turn were looked upon as instruments in the hands of a remote agent—the Divine First Cause.

This final-cause method of interpreting history is now abandoned as false. It has been discovered that laws and constitutions, as well as religions, are simply the outcome of circumstances. They are growths and not creations.

And as was the case with history the fate of the theory has been similar in other departments of knowledge. The old orthodox way of accounting for the production of a good book was to assign its authorship to an agent other than the real author—the latter was inspired or divinely instructed. Now it is allowed that a poet is not made but born.

In psychology the final-cause method of research, after having held its ground for centuries, has been finally made to give way to a more scientific method. Intelligence is no longer accounted for by the hypothesis of a soul within us—an agent using the body or the senses as a medium. Here, as was the case in other provinces of knowledge, the theory has altogether fallen into discredit.

But in the study of nature generally, we must still, it seems, be guided by the very theory and use the very method which in other known fields of inquiry has proved false. The application of this method to the interpretation of nature is to Mr. Powell evidence of culture and development. According to him the more culture one has, with the more assiduity and thoroughness will be applied the design argument in the interpretation of phenomena; for what else can these and other similar expressions mean?—"In proportion as a brain is logical, cultured, and informed, it must have the religion of causality." He must have known that evidence went the other way.

The Design Argument has been more largely relied upon by men deficient in culture than by the well disciplined intellects. Among savage and barbaric peoples it is in universal use. It is to these the only natural and eligible method of explaining the world.

The Design Argument or First Cause philosophy is, at best, but a reminiscence or survival of the barbaric method of philosophizing. At a certain stage of culture it has generally been found inadequate. To Lucretius, Spinoza, Kant, Mill, Bain, Spencer, and Comte, it has, as an argument, proved altogether inadmissible, and these, doubtless, have had "brains logical, cultured, and informed."

[It must be understood from the outset that the ideas final cause and design in nature are untenable, if they are conceived as a plan made by a divine personality. But these ideas are not so utterly worthless as Mr. Theophilus thinks. Undoubtedly, there *is* design in nature, if design means order and law. There *is* plan and purpose in the evolution of organic life, if plan and purpose of evolution mean their development with a definite direction toward the realization of what may be called ideals, of certain forms of life higher evolved and better adapted to their conditions of existence so that they come more and more in harmony with the universal order of things.

[This design in nature will be the better recognized the more man advances in his comprehension of the unity of nature.—En.]

The verdict of science, so far as I am able to perceive, is, that by the mere use of the scientific method, there is discoverable in nature neither a First nor a Final Cause: and that postulating such a Cause is, therefore, unwarrantable.

[In closing our discussion with Mr. Theophilus, we express our sincerest thanks to our honored critic for the interest he takes in the religion propounded by THE OPEN COURT. Religion, it appears, is not so dead a letter to him as he imagines, and his zeal to remove superstition proves the power of religious principles upon his mind; a power called by Kant the Categorical Imperative, and "which the old religion possessed in a high degree"—a power, of which Mr. Theophilus has unjustly spoken slightly. This power, being the essence of religion, does not lose its hold upon humanity when superstition is removed.—En.]

## THE SOURCE OF POVERTY.

A CRITICISM OF WHEELBARROW.

NEW YORK, July 23, 1888.

To the Editor of THE OPEN COURT:—

Dear Sir:—Kindly permit me to offer a few critical remarks on "Wheelbarrow's" essay contained in No. 47 of THE OPEN COURT.

Wheelbarrow's eyes are not shut to the many symptoms of our social disease, nor is he unwilling to do his fullest share, by means of well meant suggestions, to mitigate these evils. But since he does not comprehend the nature of the disease, it is impossible for him to effect a cure.

"That squalor abounds in all great cities," says Wheelbarrow, "is confessed by everybody. Squalor is the sediment of cities. Its causes are a thousand, its cures must be as many."

Is this so indisputable as it is here stated, is Wheelbarrow so positive that all these symptoms are so many different diseases, springing from just so many different causes, and necessitating as many different cures?

To the experienced physician, the fact that his patient is complaining of headache, indigestion, pain in his side, and cold feet, is no evidence that he is suffering from four different diseases, nor will he, if he can lay claim to the title of a scientist, proceed and prescribe one medicine for headache, another for indigestion, and so forth; but he will try to trace, and in most cases does trace, all these symptoms to one great fundamental disorder, knowing fully well that if he succeeds in removing this one underlying cause, all the other complaints will without special treatment disappear.

So it is with our social disease. All the many different symptoms, squalor, ignorance, intemperance, the "scab," and many others, which to Wheelbarrow seem to be evidence of just so many different diseases, to my mind are but the outgrowth of one great fundamental, social disorder, that can be cured by nothing short of the removal of this disorder.

Poverty is the *real* disease, and nothing short of abolishing poverty can be the *real* cure.

Of what avail is it to moralize about the many petty defects of human nature. The poor man knows fully well that drunkenness is not confined to any class, that the rich man does his share of it, and yet it does not reduce him to poverty, he knows the rich man does not practice economy and yet does not grow poorer. Nay, he knows that the very fact that the laborer does economize, that he is saving a few dollars, will put but another weapon into the hands of his employer to further reduce wages, and will thus be turned into an evil rather than into a blessing. "The bank book of a mechanic," says Col. Ingersoll, "is a certificate that wages are too high." Thus giving in one sentence utterance to an indisputable economic truth. Under industrial conditions as they are prevailing now, where wages mean but their necessities, it will not benefit the laborers to reduce their necessities, but to that extent will reduce wages; thus directly benefitting not the laborer, but him who furnishes the necessities. Not that I do not appreciate the moral importance of sobriety. I have no apology to offer for drunkenness; nor will I attempt to shift it from the individual upon society (though a careful examination might succeed in doing so) as Wheelbarrow accuses Mr. Morgan of doing; but as an element of improving the material condition of the workmen, it can in the nature of the case, be of no avail. It is not the men we must try to improve, it is the conditions that make men what they are, that must be altered.

Wheelbarrow is mistaken. The problem is not, as he thinks it is, of how to reduce the expenditures of the poor, to enable them to curb their desires by teaching them the blessings of self-denial; the real problem is how to increase their income, how to procure them a greater share, or rather their full share, of what they produce.

When our great coal barons, in silent conclave, determine to have no coals mined for a certain period, thus raising prices and by a simple edict depriving thousands of men of the opportunity to employ their labor, does not Wheelbarrow see that the strictest economy, the temperance of a St. John can be of no avail to these unfortunate men? They have simply been deprived of an inalienable right; a right granted to them by every law of nature: the right to the use of the earth.

Here is the gist of the whole matter. A great, an enormous, moral wrong is being perpetrated upon the masses. Thousands, nay millions, of men are cheated out of their birthright, the right to the use of the soil. Are refused standing room upon a planet that has come into existence without the help of any mortal being, and yet is parcelled out and owned as if so many houses, which being the result of labor may rightfully be owned by those that erected them.

Here is the fundamental social disorder, and here must we apply the cure. It is not by restricting people's desires, by reducing them to a mere animal existence, as would be the result of Wheelbarrow's propositions; nor by restricting personal freedom in turning the whole state into one great co-operative shop as Mr. Morgan proposes to do. It is not restriction, it is freedom that labor needs. Throw open natural opportunities, give the widest field to all individual operations, put all men on an equal footing in regard to natural bounties, by taxing to the fullest extent and for the benefit of the whole community that fund which has been created by the whole community, and all the many different symptoms, which now are so perplexing to Wheelbarrow, will disappear as if by magic.

It is impossible, within the limit this letter must necessarily be kept, to detail the effects that would be produced by a remedy at once so simple and so radical.

It is simply intended to point out in general outlines, the social disease, the sole cause, and the only remedy. He who sees that it is not the imperfection of the individual, that it is not he that is to blame, that the millionaire is but the complement of the tramp, that both are by necessity turned out by the same fundamental wrong that is at the bottom of our social system, will at once recognize the impossibility of obtaining any permanent effects by doctoring on the external symptoms, and will clearly see that nothing short of rebuilding our whole social structure will be of any real and lasting benefit to the masses.

The pages of THE OPEN COURT teach in almost every line that the laws of nature are at once impartial and unchangeable. Between the man who owns a kingdom and him who has not a roof above his head the difference is so enormous that to the untrained mind it seems almost a difference of kind. But to the student of natural law it is perfectly clear that both are but creatures of the same natural forces, that it is manifestly the condition, based upon social laws and customs, and in direct violation of all natural laws, that has raised the one to a king and lowered the other to a tramp. That the one can no more help being what he is, a king, than the other can help being a tramp, and that in order to raise the one, we need but lower the other.

This is a truth which socialists are apt to overlook. They see the laborers engaged in fierce competition against each other and at once conclude to abolish competition. But competition is a natural law, and they can no more abolish it than they can abolish the law of gravitation. Nor will it operate injuriously unless it is artificially restricted, so as not to embrace all parts of a community. Where land, the most important factor of production, is fenced in and considered the property of individuals, it is the landlord in whose power it is to determine whether labor shall be allowed to produce, or whether it shall go to waste, and it is the same factor that makes the terms. The land being a fixed quantity, with the number of applicants to work it unlimited, the landlord is

at once put beyond the necessity of competing for labor, while labor, through immigration and natural increase has to compete harder and harder for the privilege of working the land, thus ever increasing the value of it, until the struggle for existence becomes so fierce that no reward is left but the bare means of subsistence.

These are the factors from which evolves the iron law of wages, and no amount of moralizing about self-denial, temperance, etc., will ever change them. But once throw open nature's bounties to all. Once allow labor free access to all natural opportunities, by abolishing all taxation upon the products of labor, and putting it upon land values, taxing them to the last penny, and it will be seen that the holding of land is made impossible unless turned to immediate use, and competition will at once begin to set in among land holders and labor will stand on an equal footing in the making of the terms.

These are the points which every economist, who has the betterment of the masses at heart, must consider. Since nature is not concerned with the making of millionaires and paupers any more than with the making of Jews and Catholics, but since all such unnatural phenomena are but creatures of our own making, the unavoidable consequences of our laws, of environment, that must of necessity be, and remain just what they are as long as the same conditions operate to produce them, it is evident that the aim of him who wants to do mankind *real* services, who wants to emancipate labor must help to change the conditions, to change the laws, and change them radically.

For the disease is deeply rooted "and a little benevolent perfumery sprinkled on the decaying spots of our social system will not disinfect the slums, we must go down below the surface of our industrial condition and wrestle with evil in the place of its origin."

This is true. But does Wheelbarrow go down below the surface? Is he wrestling with evil in the place of its origin? Does he intend to give labor back that which no mortal power could rightfully take away from it and without which it cannot possibly exist?

Does Wheelbarrow intend to give labor back the right to the use of the earth?

I remain yours most sincerely,

SOL. LEVY.

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XXIII—Continued.

There was general astonishment at the tea-table when the Doctor once hinted that he had been invited to a masked ball, and was not averse to attending the noisy gathering. The ball was given by a large circle of distinguished citizens, to which Mr. Hummel belonged. The peculiarity of this party was that the chief actors of the city were admitted as welcome guests. As the Doctor had hitherto never shown any inclination for this kind of social entertainment, the Professor was astonished. Laura alone guessed the cause, but all received the announcement of this unusual intended dissipation with silent pleasure.

Mr. Hummel was not of the opinion that a masked ball was the place where the worth of a German citizen was shown to greatest advantage. He had unwillingly yielded to the coaxing of the ladies in his family, and was now seen standing among the masks

in the ball-room. He had thrown the little black domino carelessly about his back like a priest's mantle; his hat was pressed down over his eyes; the silk fringe of the mask overshadowed his face on all sides, which was as unmistakable as a full moon behind thin clouds. He looked mockingly on the throng of masks that streamed past him, somewhat less comfortable and more silent than they would have been without masks and colored coats. Obnoxious to him more than all were the harlequins scattered about, who, at the beginning of the festival, affected an extravagance of conduct which was not natural to them. Mr. Hummel had good eyes, but it happened to him, as to others, that he was not able to recognize every one who was masked. All the world knew him, however. Some one tugged at his clothes.

"How is your dog Spitehahn?" asked a gentleman in rococo dress, bowing to him.

Hummel bowed in return. "Thanks for your kind inquiry. I would have brought him for a bite of the calves of your legs if you had been provided with that article."

"Does this kind of a Hummel-bee sting?" asked a green domino, in a falsetto voice.

"Spare your remarks," replied Hummel, angrily; "your voice is fast changing into a woman's. I quite pity your family."

He moved on.

"Will you buy a pack of hareskins, brother Hummel?" asked a wandering pedlar.

"I thank you, brother," replied Hummel, fiercely; you may let me have the ass's skin that your wife tore from your face in your last quarrel."

"There's the rough felt of our city," cried, pertly, a little clown, as he gave Mr. Hummel a blow upon the stomach with his wand.

This was too much for Mr. Hummel: he seized the diminutive clown by the collar, took his wand away from him, and held the refractory little fellow on his knee. "Wait, my son," he cried; "you'll wish you had a rough felt in another place than on your head."

But a burly Turk caught him by the arm. "Sir, how can you dare to lay hold of my son in this manner?"

"Is this chattel yours?" returned Hummel, furiously; "your blotting-paper physiognomy is unknown to me. If you, as Turk, devote yourself to the rearing of ill-mannered buffoons, you must expect to see Turkish bamboo on their backs, that is a principle of international law. If you do not understand this you may come to me to-morrow morning at my office; I will make the thing clear to you, and hand over to you a bill for the watch-crystal that this creature from your harem has broken for me."

Thereupon he threw the clown into the arms of the

\* Translation copyrighted.

Turk, and the wand on the ground, and clumsily made his way through the masks who surrounded him.

"There is not a human soul among them," he growled; "one feels like Robinson Crusoe among the savages." He moved about the ball-room utterly regardless of the white shoulders and bright eyes that danced about him, and again disappeared. At last he caught sight of two grey bats whom he thought he knew, for it appeared to him that the masks were his wife and daughter. He went up to them, but they avoided him and mixed in the throng. They were undoubtedly of his party, but they intended to remain unknown, and they knew that would be impossible if Mr. Hummel was with them. The forsaken man turned and went into the next room, seated himself in solitude at an empty table, took his mask off, ordered a bottle of wine, asked for the daily paper, and lighted a cigar.

"Pardon me, Mr. Hummel," said a little waiter; "no smoking here!"

"You too," replied Mr. Hummel, gloomily. "You see there *is* smoking here. This is my way of masquerading. Matters are becoming wearisome. Every vestige of humanity and all consideration for others is being trodden under foot to-day; and that is what they call a *bal masqué*."

Meanwhile Laura slipped about among the masks, looking for the Doctor. Fritz Hahn could easily be discovered by sharp eyes, for he wore his spectacles over his mask. He was standing in a blue domino, near an elegant lady in a red mantle. Laura pressed up to him. Fritz was writing something in the hand of the lady, most likely her name, for she nodded carelessly; then he wrote again in her hand, pointing to himself. Probably it was his own name, for the lady nodded, and Laura thought that she could see under her veil that she was laughing. Laura heard the Doctor speaking to the lady of a *rôle* in which he had lately seen her on the stage, and he addressed her with the familiar "thou." That was, indeed, the privilege of a masquerade ball, but it was entirely unnecessary. The Doctor expressed his pleasure that in the balcony scene the lady had so well understood how to represent the glowing feeling of passion in such difficult metre. The red mantle became attentive, and, turning to the Doctor, began to speak of the *rôle* she had taken. The lady spoke for some time, and then Doctor Romeo would continue still longer. The actress stepped back some steps into the shadow of a pillar; the Doctor followed her, and Laura saw that the red mantle curtly answered some other male masks, and again turned to the Doctor. At last the actress seated herself quite behind the pillar, where she was little seen by strangers, and the Doctor stood near her, leaning against it, and continuing the con-

versation. Laura, who had also placed herself near the pillar, heard how animated it was. The subject was passion. Now it was not the passion which one felt for the other, but that of the stage; but even that was more than a friend of the Doctor could approve of.

Laura stepped hastily forward, placed herself near Fritz Hahn, and raised her finger warningly. The Doctor looked astonished at the bat, and shrugged his shoulders. Then she seized his hand, and wrote his name in it. The Doctor made a bow, upon which she held out her hand. How could he know her in that disfiguring disguise? He gave decided proof of his ignorance, and turned again to the lady in the red mantle. Laura stepped back, and colored up to her temples under the mask. It was in anger with herself, for she was the unfortunate one who had brought him into this danger: and moreover she had come in such a disguise that he could not recognize her.

She returned to her mother, who had at last been fortunate enough to find a companion in Laura's god-mother, and had got into the corner of the room in order to exchange observations on the bodily development of the baptized little Fritz. Laura placed herself next her mother, and looked at the dancing masks with indifference. Suddenly she sprang up, for Fritz Hahn was dancing with the lady in the red mantle. Was it possible? He had long abjured dancing. More than once he had ridiculed Laura for her pleasure in it; even she herself had at times, when sitting before her private journal, thought how childish this monotonous whirling movement was, and how incompatible with a nobler conception of life;—now he was turning himself round like a top.

"What do I see?" cried her mother; "is not that —? and the red one is —"

"It is immaterial with whom he dances," interrupted Laura, in order to avoid hearing the hated confirmation of it. But she knew Fritz Hahn, and she was aware there was some signification in this waltz. Juliet pleased him much, otherwise he would never have done it; he had never shown her this mark of distinction. The old comedian of the city theatre approached them as Pantaloon; he had at last found out the two influential ladies; he tripped up to them, made grotesque obeisances, and began to amuse her mamma with his gossip. One of his first remarks was, "It is said that young Hahn will go upon the stage; he is studying his *rôle* as lover with our prima-donna."

Laura turned with annoyance from the flat remark. Her last hope was the time of unmasking; she impatiently awaited the moment. At last there was a pause, and the masks were removed. She took her mother's arm to go through the room to greet their acquaintances. It seemed a long time before she got into the neighborhood of Fritz Hahn, and not once did he

look at her. Laura made a movement with her hand to touch him gently; but she pressed her fingers firmly, and passed by fixing her eyes upon him. Now at last he recognized her, as he ought to have done long before. She saw the look of pleasure in his countenance, and her heart became lighter. She stopped while he exchanged some civil sentences with her mother, and she expected that he would acknowledge that she had already greeted him, but he did not mention a word of the occurrence. Had so many written in his hand that he could not bear in mind one poor little bat? When he turned to her he only praised the ball music. This was all the notice he thought her worthy of. His conversation with Juliet had been the free interchange of mind, but to her he only addressed a few indifferent sentences. Her countenance assumed the gloomy Hummel look, as she answered, "You used to have little sympathy for the jingling instrument to which the puppets dance."

The Doctor looked embarrassed, but laughed, and asked her for the next dance. This was bad tact. Laura answered bitterly, "When the grey bat was so bold as to flutter about Romeo, he had no dance free for her; now her eyes are blinded by the bright light." She bowed her head like a queen, took her mother's arm, and left him behind.

What followed was still more aggravating. The Doctor danced once more with the lady in the mantle. Laura observed how fascinatingly she smiled on him, and he danced with no one else. Of her he took no further notice, and she was glad when soon after Mr. Hummel came up to them and said: "It was difficult to find you. When I inquired of the people for the two ugliest disguises, you were pointed out to me. I shall be glad if to-morrow morning you awake without headache. We have had enough of pleasure to-day."

Laura was glad when the carriage arrived at home; she rushed up to her room, hastily took her book out of the drawer, and wrote rapidly:

"Cursed be my deed and cursed all sinful art.  
My own true happiness is now at stake  
A troop of enemies surrounds my heart,  
Which b'eeding from so deadly wounds will break."

she wiped away the tears which rolled upon her paper.

The bright light of the following morning exercised its tranquilizing influence on her fluttering thoughts. Over there Fritz Hahn was still lying in his bed. The good youth had tired himself yesterday. Many drops of water might still flow into the sea before friend Fritz would determine to unite his fate with an actress of tragedy. She brought out her supply of old ballads and selected one; it was a very jolly one: the May-Bug's Marriage—in which the may-bug on the hedge asks in marriage the young maiden fly. Many

little birds occupy themselves seriously about the wedding, but at last it is put an end to by some disreputable conduct on the part of the bridegroom.

"Good," said Laura; "my May-Bug Fritz, before you marry the frivolous fly Juliet, other birds shall have their say about it."

She folded up the song, and added to it a little note: "You guess wrongly. The person who sends this to you never was Juliet." As she closed the letter she said to herself, with more composure: "If he does not now perceive that he was mistaken, one cannot think much of his judgment."

The Doctor was sitting a little stupefied over his books, when his eye fell upon the above letter. He cast a look upon the Marriage of the May-Bug; he had never yet come across an old copy of it, and in rapidly glancing over it he saw that many verses were quite different from our current text. Then he took the note, and endeavored to interpret the oracle. Now it was clear that the actress was the sender, for who else could know that he had accosted her as Juliet, and that they had conversed long about this rôle. But what could the words mean, "You guess wrongly?" But even on this point his eyes were blinded; he had maintained that the representation of passion could only be to a certain extent attained by an actor, if he had never in his life experienced a similar feeling. This the actress denied, and they had endeavored to come to an agreement about it; her words, therefore, clearly meant that she had impersonated Juliet without ever having previously felt a great passion. This was a confession that showed great confidence—nay, perhaps still more. The Doctor sat long looking at the note; but he now felt pretty sure who his correspondent was, and the discovery did not give him pleasure. For when he had reasoned the matter out upon rational grounds, it had always been Laura's eyes that beamed upon him from the paper, though undoubtedly quite another look from that which she had favored him with yesterday. He laid the May-Bug Marriage with the other songs, and again asked himself whether he ought to continue the correspondence. At last he sealed in answer one of the worthless trifles of his portfolio, and did not write anything in addition.

Some days after, when the Professor and Ilse were walking through the streets, they passed by the dwelling of the actress; both saw their friend standing at the window of the heroine, and he nodded to them from within.

"How has he made this acquaintance?" asked the Professor; "is not the young lady considered very fast?"

"I fear so," answered Ilse, troubled.

(To be continued.)

## BOOK REVIEWS.

## WEBSTER'S DICTIONARY.

The excellent qualities of Webster's Dictionary are known. It is an indispensable piece of furniture in every office where literary work of any description is to be done. On glancing at the most recent edition before us, we find that it is worthy of all its renowned predecessors.

The very excellency of such a book, as this really is, has induced the public to rely on its definitions and explanations more than can justly be expected from a mere compendary work. Webster is generally resorted to by a large class of people for information upon scientific, technical, and philosophical terms, and this very confidence of the public (a consequence indeed of the excellency of the book) should impose upon the editors the difficult duty of presenting the most reliable definitions of words. So far as we can judge, this is done in the terminologies of the natural sciences, in mechanics, and other branches, but it is not sufficiently done with regard to philosophical terms. The explanations of prosody also lack precision. Other dictionaries, it is true, have been even more careless in this respect, and it cannot be doubted but that our dictionaries are to be blamed for much confusion that prevails in philosophical subjects.

We have taken occasion in an editorial on page 728 of THE OPEN COURT, to call attention to some of Webster's mistakes with reference to the word *noumenon*. Webster defines it as the "thing in itself, which is distinguished from the *phenomenon*." But it is the thing as a concept or idea produced by thinking, which is distinguished from the thing as a phenomenon represented in the sensory perception. Moreover, the verb from which it is derived, *noein*, is wrongly translated "to perceive"; it means "to think."

The popular misconception of a word such as 'noumenon' is, being perpetuated and sustained by Webster's authority, has become a stumbling block for many minds, and even for great English-speaking thinkers, to a proper understanding of Kant. If this fundamental term is misconceived, it is impossible to get at a clear conception of the Kantian philosophy.

There are a few other definitions deficient in one or another way, to which if time and space permitted, we would also like to call the editors' attention. The word *homaloid*, (from *ὁμαλός*, even) meaning 'flat,' with reference to space,—in which as Riemann expresses it, the curvature is equal to zero—is not yet contained either in the dictionary or its supplement.

P. C.

## NOTES.

*Book Chat*, published monthly at Brentano's New York, contains much food for bibliophiles.

The *Popular Science Monthly* of September contains a sketch and portrait of the great mathematician Carl Friedrich Gauss.

Amélie Rives has ventured on an historical drama, "Herod and Mariamme," published in the September number of *Lippincott's*.

The two first numbers of *Life Lore* are full of instruction. It is a monthly magazine of Natural History, particularly adapted to young readers.

The *Revue de Belgique* contains in its latest numbers (June, July, and August), an interesting essay by Emile Coemans, "*La femme dans l'ancienne Egypte*."

The *Century*, for September, contains an essay by T. T. Munger, commending the study of the Bible in our universities from a purely scientific standpoint.

Mr. Charles G. Leland tells his little readers in *St. Nicholas* for September, what to do with old corks. It is wonderful how an inventive mind can make use of this almost valueless material which is mostly thrown away.

The September *White Hawk* is as interesting as ever. Among other things it contains "A Little Lombard Hero," a touching Italian story, by Edmond de Amicis, translated by Miss Marcia Thouay, the little daughter of the American consul at Turin.

We call attention to the Editorial of this number which, it is hoped, will do away with many almost general misapprehensions. Criticisms of the essay will be welcome; if weak points in the argument can be stated, the editor will gladly acknowledge and correct his mistakes. Objections and questions will be answered so far as space and time allow.

We are in receipt of a pamphlet by Prof. George von Güzky, "Kant und Schopenhauer," containing two essays and considering the ethical views of both philosophers. Having critically examined Kant's faults, especially the scholasticism of his terminology, the lack of lucidity (it seems that he never strove for philosophical popularity), the slovenliness of style (his greatest works are too quickly written), Prof. Güzky concludes: "In spite of all, there is no doubt that Kant must be revered as one of the greatest ethical teachers of all ages and certainly the greatest German moral philosopher. His doctrines of Duty, of Good Will, of the Categorical Imperative, and of Moral Autonomy contain elements of imperishable worth." Prof. Güzky's book is a valuable contribution to ethical philosophy.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God.** By O. B. Frothingham. Price, 5 cents.  
**Lecture on the Bible.** By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
**Christian Propagandism.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
**God in the Constitution.** By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
**Compulsory Education.** By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
**The Present Heaven.** By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
**The God of Science.** By Francis Ellingwood Abbot. Price, 10 cents.  
**On the Vision of Heaven.** By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
**A Study of Religion.** By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
**The Battle of Syracuse.** Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
**The Bible and Science.** By John Weiss. Price, 10 cents.  
**The Sympathy of Religions.** By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
**Evolution and Religion.** By John Fluke. Price, 5 cents; 10 copies, 25 cents.  
**Giordano Bruno and the Relation of his Philosophy to Free Thought.** By Thomas Davidson. Price, 10 cents.  
**Transcendentalism.** By Theodore Parker. 39 pages. Price, 5 cents.  
**The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen.** By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
**An Agnostic View of the Doctrine of Vicarious Atonement.** By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
**Evolution in its Relations to Evangelical Religion.** By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents. 100 copies, \$1.00.  
**Messianic Expectations.** By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
**The Proposed Christian Amendment to the Constitution of the United States.** Price, 5 cents; 10 copies, 25 cents.  
**The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life.** By Lewis G. James. Price, 10 cents.  
**Social Ideals.** By David A. Wasson. Price, 10 cents.  
**The Decay of the Christian Church: its Causes and Remedy.** By Rev. J. C. F. Grumbine. Price, 15 cents.  
 A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

### WANTED!

An energetic and educated person wanted in every town, city and district, to canvass for subscriptions to *THE OPEN COURT*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,  
Box F., Chicago, Illinois.

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most Inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00. All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

BRENTANO'S,

5 Union Square, New York.

101 State Street, Chicago.  
17 Avenue de l'Opera, Paris.

### THE LEADING ORGAN

of British Thought on the American Continent

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum. "THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,  
TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

AGENTS wanted for religious and economic books.  
100, Charles H. Kerr & Co., Publishers, Chicago.

### LECTURING.

JNO. GEORGE HERTZIG, of Washington, D. C., desires to lecture during the coming winter, and solicits engagements for this purpose. In religious matters he is an absolute free-thinker, and as to public questions generally he is a thorough radical. He was born in Germany, where he received a collegiate and university education, and has lived in the United States thirty years. He will lecture in English. Address P. O. Box 706, Washington, D. C.

### Recent Contributions to 'The Open Court.'

#### THE INDIVIDUALITY OF ATOMS AND MOLECULES.

REV. H. H. HIGGINS M. A. In Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *biar*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesis endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problem of Memory."

#### DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZYCKI. In Nos. 25 and 26.  
Georg Von Gizycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject have been published from E. P. Powell and Xenos Clark.

#### THE ETHICAL BASIS OF CHARITY.

W. ALANER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

#### THE QUESTION OF IMMORTALITY

Is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that Immortality according to the Monistic view is immanent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay, "THE PROCESS OF PROGRESS," in No. 24, speaks of death as a mere transition and C. Billups in a letter of No. 25 criticizes the wrong notion of a transcendent immortality as taught by Dualism.

#### FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK. In No. 39.  
Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is here made of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with *THE OPEN COURT*, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

#### WHAT MIND IS.

PROF. E. D. COPE. In No. 40.

#### THE NATURE OF MIND.

By the Editor of *THE OPEN COURT*, No. 40.  
Professor Cope gives in clear and comprehensive outlines his view of mind; he opposes Materialism and Dualism, stating that "the situation is monistic." However, "as the amount of thought can most assuredly be measured, but the quality of thought can not," the eminent American scientist concludes that "consciousness has a field of its own where it ranges free from the bonds of energy." The directive element (will and mind) is qualitative not quantitative and controls the movements of the non-mental environment. "This statement may be called occultism," Prof. Cope adds, "and I suppose justly. But such is the fact."

In opposition to Prof. Cope, the Editor explains his view of mind. The qualitative faculties are a matter of form. Form is the essential characteristic of mind, and a superior mind indicates a superior form of brain structure. Form is an abstraction from reality and has by itself no efficacy. M. Ribot, the founder of the French school of experimental psychology, is quoted in support of the fact that consciousness by itself is not an effective factor in the motion of our limbs. "The consciousness of mental states may be indispensable for a proper direction of our will, but it does not possess motive power. Prof. Cope's view is considered inconsistent because leading to dualistic statements and to occultism."

A letter from Prof. E. D. Cope, which has reference to this discussion, is published in No. 42.

### A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

CHAS. W. SMILEY, Publisher,  
Box 630, WASHINGTON, D. C.

### LECTURING.

Mr. GEO. WILLIS COOKE will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American Ideas were gradually developed. Mr. COOKE'S address is DEDHAM, MASS.

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. PINET.

Translated from the "Revue Philosophique" by J. M. P.

PART V.

III.

### THE PSYCHOLOGY OF NUTRITION.

It will be necessary to go more into detail, in considering the psychology of nutrition.

The mode of nutrition among Micro-organisms is not uniform—a fact which ought not to appear remarkable when we bear in mind that this immense group is made up of all manner of heterogeneous beings that have nothing in common save the microscopic littleness of their bodies and the simplicity of their structure. Three main types of nutrition may be briefly distinguished.

1. *Vegetable nutrition*, or according to Bütschli's expression, *holophytic*. This is the method of nutrition among animal or vegetable cells that contain chlorophyll and that nourish themselves by forming organic nutriment from ingredients taken from the surrounding medium. It is hardly necessary to call to mind that the function of chlorophyll is that of nutrition and not of respiration. This phenomenon was formerly termed the diurnal respiration of plants. The expression involves several mistakes. Enough to say that vegetables respire as animals do, by uniting with oxygen, and that that respiration continues the same both day and night. The function of chlorophyll is by no means respiration; its office is to decompose the carbonic acid gas of the air and to seize the carbon, which serves the plant in forming ternary or quaternary substances. This chemical work is performed by all chlorophyll organisms when influenced by the radiation of light.

Chlorophyll does not belong exclusively to the vegetable kingdom. A large number of animal Micro-organisms are colored green by this pigment; they are met with principally in the important group of Flagellates. Their assimilative organs, which are likewise found in all green plants, bear the name of chromatophores; they have lately formed the subject of interesting investigations.

The chromatophores are small bodies of protoplasm which are distinguished from protoplasm in general

by their having assumed an individual structure. These little bodies, which in the vegetables are called *leucites*, have a granular and reticulate structure; they are impregnated with a coloring substance, at times green, at times yellow, and at times brown, as the case may be; in fact, several coloring substances are present, which, by intermixture in different proportions, form colors of many varieties. The best known, after green chlorophyll, is yellow chlorophyll or *diatomin*. The latter coloring substance can be absorbed by alcohol.

The Euglenoididæ, the Chlamydomonadidæ, and the Volvocinæ exhibit enormous chromatophores. In the case of the Euglenæ, the chromatophores are formed of small discoid plates; they are situated directly under the cuticle, so that the light can act upon them (see fig. 4\*). In certain species of Flagellata, they are exhibited under the cuticle in the form of two large plates which envelop the protoplasm like a cuirass formed of two pieces. The Chlamydomonadidæ and the Volvocinæ have green chromatophores, disc-shaped, and very small.

In the centre of the chromatophore a small bright space is observed which was formerly thought to be filled with chlorophyll; in reality, it is a minute solid globule which shows an extremely close analogy with the substance composing nuclei, or nuclein. It exhibits the same chemical reactions; it actively absorbs coloring matter and grows extremely brilliant when treated with acids. Schmitz gives this little body the name of pyrenoid (from *πυρρον*, nucleus). It is around the pyrenoid, and probably through its action, that starch forms; it is deposited in grains or re-unites in a ring about the pyrenoid, a fact easily ascertained by coloring them with iodine.

Production of starch has also been observed in the colorless Flagellates, as for instance in the *Polytoma uvella*. These latter do not have chromatophores, but Künstler, and after him Fisch, has noticed that every grain of starch is attached to a small mass of colorless protoplasm which is the focus of formation for the grains. This is precisely what happens in vegetable organisms where colorless starch-leucites are found. This little mass of protoplasm always faces the hilum of the starch-grain.

\* Translation copyrighted.

\* For figure 4, see No. 50, page 1139, of THE OPEN COURT.

As the function of the chromatophores is exercised only when subjected to the influence of light, it follows that green Micro-organisms must have light in order to nourish themselves.

A quite remarkable fact may be adduced in this connection. On examining the kingdom of Protozoans as a whole, it will be seen that a striking coincidence exists between the presence of the eye and the presence of the chlorophyll pigment. Organisms having an ocular spot are in most cases provided with the chlorophyll pigment, or, in other words, nourish themselves as plants do, by generating starch through the action of light. This fact proves that sensibility to light is in some manner dependent upon the chlorophyll function. If Flagellates possessing chromatophores, that is organs generating starch, have ocular spots at the same time, it is because these rudimentary eyes enable them to find their way towards the light, which is the necessary agent of chlorophyll action. Accordingly, all Micro-organisms having eyes nourish themselves as plants do. In their case, the object of the eye is to direct the performance of a vegetable function.

It is interesting to note in this connection that the Euglenæ might nourish themselves as animals do, for they have a mouth and a digestive apparatus. The buccal, or oral, aperture opens in the anterior end at the base of the flagellum, and is connected with a short gullet or esophagus (see fig. 6,\* the mouth and gullet of an Euglena). Nevertheless, the Euglena is never seen using its mouth for swallowing alimentary particles. A quite curious problem is involved here. If it is true, as has been claimed, that it is the function that makes the organ, how do we explain the existence and especially the genesis of this digestive apparatus which performs no function?

It is the presence of chromatophores that prevents certain Flagellates from feeding like animals; so much so in fact, that the digestive apparatus performs its functions in Flagellates which have no chromatophores and are not provided with chlorophyll pigment, an instance of which is seen in the *Peranema*. The *Peranema* is, further, an exceedingly voracious animal. We must note also that the *Peranema* does not exhibit ocular spots like the green Euglena; and moreover, it has no need of such, since it does not have to seek the light to generate starch. All these phenomena are interdependent.

The influence exerted by light upon the green organisms of both kingdoms has been ascertained by different scientists. Light at a certain degree of intensity attracts them, and at a greater degree, repels them. Some years ago M. Strassburger conducted a series of connected experiments upon the

movements of green spores towards light. It was observed, here, that the grains of pigment in the interior of the cellules, when under the influence of solar radiations, executed movements and set outwards in all directions.

2. *Nutrition by endosmosis, or saprophytic.* The organism nourishes itself by absorbing through the whole surface of its body liquids containing the products of vegetable or animal decomposition. Saprophytic beings are found in putrid waters or in infusions. This manner of nutrition may be considered, from the point of view which now engages us, as the most simple of all; it probably allows of a search for food, but it is certain that no movements are involved which are designed to draw the food into any possible digestive apparatus.

3. There is now a last mode of nutrition, of which we shall treat in minute detail; namely, *animal nutrition*, where the Micro-organism seizes solid alimentary particles and nourishes itself after the fashion of an animal, whether it be by means of a permanent mouth or by means of an adventitious one, improvised at the moment of need. This manner of nutrition is the process employed by higher animals. Among the lower organisms, it is met with in most of the Infusoria, in the Sarcodines, in many of the Mastigophores, and in others. Respecting the Micro-organisms belonging to the vegetable kingdom, we find nutrition by endosmosis and chlorophyll nutrition; the Protophytes never possess a mouth and never absorb solid foods.

Animal nutrition requires very remarkable psychological faculties in the organism practicing it. These manifestations of psychic life, the progressive complexity of which we intend to trace in starting from the simplest protozoic forms and arriving at the higher—prove that these animalcula are endowed with memory and volition. We shall group our remarks under the two following heads:

- a. The choice of food; and
- b. The movements necessary for the prehension of food.

The Micro-organisms do not nourish themselves indiscriminately, nor do they feed blindly upon every substance that chances in their way. Also, when they ingest food through some point or other of their bodies, they understand perfectly how to make a choice of the particles they wish to absorb. This choice is sometimes quite well defined, for there are species which feed exclusively upon particular foods. Thus, there are herbivorous Infusoria and carnivorous Infusoria. Among the herbivorous ones may be classed the chilo-dons which feed upon small Algæ, Diatomaceæ, and Oscillaria. The paramecia live principally upon Bacteria. The Leucophrys is a specimen of the carnivorous.

\* For figure 6, see No. 51, page 1151, of THE OPEN COURT.

rous class; it devours even the smaller animals of its own kind. The *Cyrtostomum leucas* eats everything, as do the Rotifers.

Though the fact of an exercise of choice in taking food is settled beyond question, yet the interpretation of this phenomenon is a matter of much uncertainty. Some writers, as Charlton Bastian for instance, explain this choice of food as an affinity of chemical composition existing between the organism and the nutriment. This idea does not lead to anything. Others compare the discrimination made by the Proto-organism between objects presented to it, to the action of a magnet which in some way selects particles of iron that have been mixed with particles of other substances. The latter interpretation is an evidence of the tendency evinced by some naturalists, of endeavoring to identify the attributes of living organic matter with the physico-chemical properties of the mineral kingdom.

In our opinion, the only question demanding consideration is whether the choice of food, in the case of Proto-organisms, does or does not result from a psychical operation, similar, for example, to that which takes place in higher organisms. We have received a noteworthy communication from M. E. Maupas, upon this subject, which tends to establish that the choice of food is not the result of individual taste in the Micro-organisms, but is determined by the organic structure of their buccal apparatus which does not allow them to receive other forms of nutriment.

We must closely examine, therefore, the mechanism for prehension of food.

The following is what occurs when the Amœba, in its rampant course, happens to meet a foreign body. In the first place, if the foreign particle is not a nutritive substance, if it be gravel for instance, the amœba does not ingest it; it thrusts it back with its pseudopodia. This little performance is very significant; for it proves, as we have already said, that this microscopic cellule in some manner or other knows how to choose and distinguish alimentary substances from inert particles of sand. If the foreign substance can serve as nutriment, the Amœba engulfs it by a very simple process. Under the influence of the irritation caused by the foreign particle, the soft and viscous protoplasm of the Amœba projects itself forwards and spreads about the alimentary particle somewhat as an ocean-wave curves and breaks upon the beach; to carry out the simile that so well represents the process, this wave of protoplasm retreats, carrying with it the foreign body which it has encompassed. It is in this manner that the food is enveloped and introduced into the protoplasm; there it is digested and assimilated, disappearing slowly.

There are cellules found in the inner intestinal

walls of lower animals which effect the prehension of solid foods in the same manner as the Amœba cellule: they are called phagocytes.

This mode of prehension is beyond contradiction the most simple imaginable; for the prehensile organ is not as yet differentiated. Every part of the protoplasm may be made to serve as a digestive cavity in enveloping the foreign substance.

From the special standpoint of prehension of food, we may place the *Actinophrys sol* above the Amœba. This animalcule is a small microscopic Illeizolarian abounding in fresh-water ooze. It casts out long, slender, filamentous pseudopodia from every part of its body. When its prey or any alimentary substance gets into the midst of this mass of filaments, the filament affected quickly draws back, carrying the nutritive matter with it towards the body proper of the Actinophrys. In other instances, the filaments, anastomosing themselves, form a sort of envelope about the prey. At the instant the substance comes within a short distance of the cellule, a part of the protoplasm composing the mass projects itself forwards, and encompasses the food, which is carried back and enveloped in the midst of the protoplasm by a process analogous to that seen in Amœba.

In the case of the Actinophrys any part of the body could serve as a way of entry for food, that is to say, could act as the part of a mouth. To use the expression of W. Saville Kent, it is a *pantostomate* being. In other species of higher organization, this mode of alimentation is rendered impossible by the cuticle which encompasses the body; the formation of a cuticle impervious to solid foods creates the necessity of a buccal orifice through which food may enter into the interior of the protoplasm.

A curious graduation in these phenomena is noticed here. Thus there are organisms destitute of a permanent and pre-existing mouth; their mouth is improvised as the occasion demands, is adventitious, so to say, and the reason that these organisms are ranked higher than the preceding ones, is that the mouth is invariably formed in the same place.

In this connection we may examine a small flagellate Infusory which abounds in impure waters, the *Monas vulgaris*. It carries a long flagellum attached to its anterior extremity, which when not in motion, is coiled up against the body. At the base of the flagellum the protoplasm projects a pellucid substance in the shape of a lip. This protuberance is hollow, containing a vacuole filled with liquid. Cienkowsky has described how these different organs act. The Bacteria and Micrococcus, which constitute the food of the *Monas*, are pulled into the latter's neighborhood by strokes of the flagellum; at that instant, the animal becomes conscious of the proximity of these other

bodies, for the protuberance which lies at the base of the flagellum extends towards the corpuscle, envelops it in its own substance, and pulls it back into the interior of the Monad's body. Bütschli has made an analogous observation with the *Oikomonas termo*.

The prehension of food comprehends, here, three phases, in two of which the organism manifests psychical activity: *first*, attraction of food by means of the flagellum; *second*, formation of the vesicle which extends towards and envelops the food, when the latter has come near; *third*, absorption of the food.

The Acinetæ are organisms that move about very little; they frequently remain fixed to a pedicle their whole life long. They have no cilia, but exhibit radiating prolongations, more or less numerous, and sparse or grouped in tufts, as the case may be. These filaments are suckers, provided at the end with a small air-hole. When a thoughtless Infusory swims into the territory of an Acineta, the latter arrests it by means of its stout filaments and fastens upon the former's body the cup-shaped extremities of its suckers, which make a vacuum. The protoplasm of the Ciliate thus captured, slips slowly through the suckers as through tubes, and is gathered together in the interior of the Acineta in the form of small drops. In the Acinetæ, accordingly, particular organs are adapted to the prehension and absorption of food. Corresponding to the greater complexity of physical action, the psychical process necessary for the act of prehension has likewise become more complicated than is the case with the Amœba. The Acineta is obliged to *direct* its sucker towards the Infusory which is within its reach, and consequently the animal is obliged to determine the position of its prey.

There are Acinetidæ that exhibit prehensile organs more perfect than those just noticed. Such are the *Hemiphrys*. They have both sucker tentacles and prehensile tentacles. The latter are filaments which the animal throws about its victim like a lasso, thus enveloping and rendering it motionless, while it proceeds to feed upon it by means of its suctorial apparatus.

Now, do these Acinetidæ show any preference of choice among the Infusoria that chance to fall within reach of their tentacles? M. Maupas, who has made an especial study of these organisms had at first admitted this preference in choice. But he afterwards rejected the notion. In 1885, he writes us: "I find quite another explanation of the impunity with which the *Coleps hirtus* can throw itself upon the terrible suckers of the *Podophrys fixa*. The stout shell with which this little Infusory is enveloped, serves it as a shield and guards it from the deadly grasp of the Acinetidæ. The Acinetidæ do not seize the Coleps because

of any dislike of the latter, but because they are unable to seize them, and their inability results from the peculiar structure of the Coleps' tegumentary envelope. The Paramecia which also escape unscathed, are similarly provided with a tegument of high resisting power, which serves them as a protection in this contingency. The *Stylonichia histrio*, like all other Stylonichia, has a very soft tegumentary envelope. They are accordingly seized and devoured by the Acinetidæ without difficulty. The detailed knowledge of the differences of structure in the tegumentary envelopes has caused me to abandon the idea of a preference or dislike in the choice of those victims which serve as food for the Acinetidæ. Of the prey that passes by, they catch what they can and not what they want to."

In a large number of species the prehension of food is preceded by another stage, the search for food, and in the case of living prey, by its capture. We shall not investigate these phenomena among all the Protozoa, but shall direct our attention especially to the ciliated Infusoria. Their habits are a remarkable study. If a drop of water containing Infusoria be placed under the microscope, organisms are seen swimming rapidly about and traversing the liquid medium in which they are in every direction. Their movements are not simple; the Infusory guides itself while swimming about; it avoids obstacles; often it undertakes to force them aside; its movements seem to be designed to effect an end, which in most instances is the search for food; it approaches certain particles suspended in the liquid, it feels them with its cilia, it goes away and returns, all the while describing a zig-zag course similar to the paths of captive fish in aquariums; this latter comparison naturally occurs to the mind. In short, the act of locomotion as seen in detached Infusoria, exhibits all the marks of voluntary movement.

It might also be mentioned that every species manifests its personality in its mode of locomotion. Thus, as a rule, the *Actinotricha saltans* when placed in a preparation where it finds itself at ease, remains for a few moments perfectly immovable. Then, of a sudden, it dashes forward with the rapidity of lightning and disappears from the field of vision. For a time it darts about to the right and to the left, and then once more assumes its state of immobility. It can move with the greatest agility through masses of *débris*, in the midst of which, bending and twisting, it slips about with wonderful nimbleness. The *Lagnus crassicolis*, on the other hand, moves along at a pace quite constant and uniform, neither slow nor rapid. It winds about among algæ and fragmentary particles, in search of its prey. The *Peritromus Emma* moves slowly. It runs lazily over the Algæ, where it seeks

its nutriment, and does not stray from them to venture into the open water.

(To be continued.)

#### DRUMMOND'S NATURAL LAW IN THE SPIRITUAL WORLD.

BY JAMES HERBIN.

This book has created a sensation in certain orthodox circles, and gained quite a popularity, because, when superficially considered, it has the appearance of substantiating certain Christian dogmas by scientific analogies.

There is enough philosophy and science in it to confuse the many readers; and by people with an orthodox bias, it is pointed to with pride and triumph, as unquestionably settling vexed questions about which scholars have expended a great amount of thought. People who are not familiar with the writings of Herbert Spencer, Tyndall, Huxley and Darwin, would be apt to be misled about opinions held and unqualifiedly expressed by these eminent authors. Drummond is imbued with sufficient science and metaphysical philosophy to carry him dangerously near the point of forsaking the whole orthodox structure; and he will have to stop where he now is and allow his iron-clad dogmas to keep a firm hold on his mind, or the result will be disastrous to his orthodox notions.

The Platonic thought that "Ideas are the only true existences," and the teachings of Fichte and Schopenhauer, that matter is an illusion or only a state of consciousness; that all objects of which we can form any conception are not real, but exist only for the subject, and in the subject, cannot be indulged in and endorsed by any one who believes and teaches a literal sacrifice, and that immortal life is only possible because of that act.

These statements are found on the last page of the introduction, which the author did well to advise the general reader to avoid.

In the fore part of the introduction he asserts that Theology was imperfect when it was formed, and that "it must pass through the necessary stages of progress, like any other science." Of course, if it was perfect at its formation, it could not progress; but it is difficult to understand how a system that sacrificed the only Son of the Most High, to save a dying world, and under the direct supervision and sanction of God Himself, could be so imperfectly constructed as to need to progress like a science.

On page 39 he asks: "What, then, has Science done to make Theology tremble?" The Science of Bruno made Theology tremble, and Theology burned Bruno at the stake. The Science of Copernicus and Galileo made Theology tremble, and it suppressed the one and put the other to the tortures of the Inquisition, to sustain its untenable position, which the light of advancing knowledge forced it finally to abandon. The Theology of ancient

Greece trembled at the light that shone from Socrates, and Theology made him drink hemlock. History is full of examples. How can any one, in the light of the knowledge of the Nineteenth Century, ask such a question?

Page 40. Then the inspiration of Revelation was left obscure, and it did wander benighted down through the Dark Ages, causing persecution, bigotry, human suffering, fierce wars of extermination, bloodshed and cruelty, and it is only within the last two hundred years that the light of Science has come in to correct these terrible errors, and set Theology right, which it has not yet succeeded in doing.

Drummond in his Biogenesis claims to substantiate the theological dogma of regeneration by an analogy in biology.

Regeneration, according to Drummond (and probably orthodoxy would accept his definition if its conclusions were not pressed home too strongly), means that only through Christ can human beings attain to immortality. He claims, and fairly, that the foundation of the whole Christian church, Catholic and Protestant, and all of the various sects comprising these two denominations, rests upon this dogma as their corner-stone; and if it were removed, the whole fabric would fall into ruin. The whole matter is stated in one terse sentence: "Except a man be born of water and of the Spirit he cannot enter the kingdom of God."

There is no mistaking the meaning of that sentence. Unless you are regenerated, and in a certain way, you can have no claim upon, and can never expect to attain to, eternal life. No matter how good you are; no matter how spiritually minded you may be, or how self-sacrificing, pure, charitable and forgiving a life you may lead, it is absolutely and unconditionally necessary that you be regenerated, or you will be eternally punished. That can hardly follow, either, according to Drummond, for annihilation is a necessary corollary of his ideas.

Not taking evolution into account, but accepting literally the Mosaic statement that the earth has endured only six thousand years, how many untold millions of wretched human beings have been swept off into annihilation or everlasting torment. The author admits that hitherto there has been no reason for believing that uncomfortable doctrine excepting that the Scripture says so. He admits that the want of any rational defense of the doctrine has been keenly felt, and that they have been obliged, heretofore, to rely on the *ipse dixit* of Revelation. "Man has, or may have," says Drummond, "two lives; a natural life and a spiritual life." "The natural life is the existence that all organized beings or things possess on earth. It comes from the ancestors of the living organism, they may transmit to their offspring; but the life of the individual organism dies when the corporeal structure is finally disintegrated." The spir-

itual life is a direct gift of God, and is only obtained by acquiring a certain mental state and performing certain material conditions.

"If you believe certain dogmas, and perform certain rites, a new life, which is permanent and never-ending, will be given you, and you will dwell in Paradise with the sons of God forever."

To prove this by scientific analogy he makes the following statement: "There is no spontaneous generation of life. The passage from the mineral world to the plant or animal world is hermetically sealed on the mineral side. No mineral structures can lift themselves up by any inherent power of their own and become organic. \* The power of the analogy for which we are laying the foundations to seize and impress the mind, depends on the vividness with which one realizes the gulf which nature places between the living and the dead." And, he says, "there is also such a barrier in the spiritual spheres." "The passage from the natural world to the spiritual world," or from natural life to spiritual life, "is hermetically sealed on the natural side. The door from the inorganic to the organic is shut, no mineral can open it; the door from the natural to the spiritual is shut, and no man can open it." Now, so far as his spiritual world is concerned, that being the creature of his own imagination, or the offspring of his dogmas, he can erect as many barriers as he pleases, consistent with his theology; but his barriers between the organic and inorganic kingdoms are as baseless as the fabric of a vision, and have no foundation in science. He admits that his theology is imperfect. The position that he must occupy is this: When inorganic substances become organized, when they become integral parts of organized bodies, they are alive; they are changed by the life forces that govern them, and become themselves living structures. In reality, matter is never alive; it is always dead, and always will be; it needs no barriers, natural nor artificial, to keep it in that state. This is another natural law with which Drummond has not become acquainted.

The chemical composition of bioplasm is more complex than any inorganic substance, but bioplasm is still a compound of molecules of oxygen, hydrogen, nitrogen and carbon. The formation of the molecules into a complex compound does not endow one molecule with life; and one molecule represents the entire mass of the structure. The life forces build up and organize the inert atoms, use them for their own purposes as they need them; they come into the organism inert atoms only as they are acted upon, and they are pushed out of the organism the same inert atoms that they were when taken in. Matter will never know that it is "touched," neither before nor after "bioplasm has done its gracious work." It being compelled by life forces to serve them, does not change it nor give it consciousness. When my friend takes crystals of chloride of sodium with his dinner, and

it helps build up his corporeal structures, it may be allowed by his life forces to remain chloride of sodium, or it may be decomposed into atoms of the original elements, chlorine and sodium, of which it is formed, undergo a hundred transformations, difficult to trace, and then, in a few hours or days, as is always the case, be thrown off from the body, never for a moment having possessed consciousness nor vitality, but having been used by both.

What a complicated and wonderful structure is the human form! When controlled by life it is certainly "noble in reason, infinite in faculties, and God-like in its attributes;" but in a moment all these qualities disappear, and there lies your dead matter, the atoms of which are just as much alive now as they were when it was bearing itself aloft in the grandeur of its beauty and its activity. The molecules of iron that help to form its structure, are the same now as they were when the blood was pulsating under the temples, and the same as they will be next week when they help to form a bit of rusty scrap-iron. The molecules of oxygen are as when they were helping the expressive eye to cast bright and meaning glances, or as they will be when they have floated off, and are combining with hydrogen and carbon, in one of a thousand lights which helps to illuminate a palace.

The molecules of dead matter which to-day form our bodies, were, last summer, helping to form the waving grain on the hillside, and becoming integral parts of the green and tender herbage that was cropped by the oxen there grazing, and which have since through the channels of the mills and butcher shops, been placed on our tables to serve for dinners, and when eaten, to supply the place of other molecules which are being constantly thrown off from the system through destructive metamorphosis.

And every molecule of the elementary substances of which our bodies are formed to-day, will next summer again be undergoing the same transformations. And every one of these molecules belongs to the inorganic kingdom. How foolish to talk about barriers and analogies when every molecule in the domain of nature belongs to the organic to-day, and to the inorganic to-morrow. Advancing science has formulated with great distinctness what constitutes matter. The division of matter into organic and inorganic is arbitrary and unscientific, because it changes from one form to the other so quickly and easily that no barriers can keep them apart. The molecules of oxygen floating around me as I write, are inorganic. The burning lamp-flame catches some of them, and, quicker than the conjurer's magic transforms them into carbonic acid or water, as they happen to unite with the carbon or hydrogen that constitutes the vapor of the oil, and they are inorganic still. I inflate my lungs at the same moment,—catching some of the same crowd, and as quickly as in the other case, they are integral parts of my blood

globules, and are coursing in red life currents through my arteries, and belong to the organic kingdom. All matter is constantly in motion, and is as changing in its restless activity as the surface of the sea. Science, through chemistry, has enumerated all the elementary substances, marked out their combining power with one another, and tells us how, in measured numbers, every compound in nature is formed. We also have a very comprehensive idea of the forces of nature and the laws that govern those forces. One serious blunder that Drummond has made, is in confounding the laws and forces with one another.

The physical forces, motion, heat, light, electricity, chemical affinity, gravitation, vitality, etc., work in a regular and orderly way; the way in which they work comprises their laws. Gravitation is not a law, but a force. These forces act upon matter according to laws. The lower and more stable aggregations of molecules which constitute a double salt, are built up in just the same way in which the higher and less stable aggregations of molecules which constitute protoplasm, are built up. It is a commonplace of science that the physical forces are transformable into each other, and it is held by high authority that they are transformable into sensation, emotion and thought. That they are transformable into each other is an accepted fact, and that in the building up of highly complex organized structures some of the other forces are transformed into vitality is beyond question. How this is done is still a profound mystery, but no more profound a mystery than how aerial vibrations generate the sensation we call sound; or how, how gravitation holds the planets in their evenly balanced orbits around the sun.

#### RELIGION AND SCIENCE.

##### *A Résumé.*

For the benefit of a correspondent who is interested in the Theophilus discussion and has not seen the back numbers of THE OPEN COURT, we propose the following explanations and definitions:

The subjective basis of cognition is the sensation of the subject; while the objective basis is the existence or rather manifestation of Reality.

Truth is the conformity of cognition with reality, i. e., of our concepts with the things represented in our concepts.

Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a *contradictio in objecto*; it would imply cognition without a cognizing subject. At the same time it is obvious that an absolutely Unknowable is impossible; it would imply the existence of an object whose existence is not manifested, i. e., an object without reality.

Science is the search for truth.

The method of science is the economy of thought.—*Math.*

Knowledge is the possession of certain truths.

Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without Knowledge. The

object of Science is not only to increase and enlarge Knowledge but also to purify the present stock of Knowledge from vagueness, errors, and misconceptions. Accordingly, Science may exist and has existed with little Knowledge; and much Knowledge can be found in many minds where Science is wanting.

Religion is man's aspiration to be in unison with the All.

The basis of all morality is religious. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.

Morals is man's conduct in so far as it is in unison with the All.

Ethics is the Science of Morals which teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented in editorial articles are in strict agreement. Mr. Hegeler defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All", (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the Individual, (see footnote page 965); as "man's conception of the world that serves him as a guiding-star through life," (page 1180). Monism has been explained as the recognition of the Oneness of All-existence; Religion, it is stated teaches that the individual is a part of the whole and has as such to conform to the cosmical laws of the All.

Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions of the world, of its origin, and of its purpose. Similarly science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion and all the errors of science are no evidence that science as such is a sham. It is obvious that religion and science, as defined by THE OPEN COURT, complement each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been a constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

Monism affords a basis for their unison and opens a new vista of progress for both. [Editor.]

#### SONNET.

BY LOUIS BELROSE, JR.

Full often, when my way is long and lies  
Through busy streets in which the dazzling light  
Gleams from a thousand lamps until my sight  
Is all bedimmed, I raise my weary eyes  
Above and rest them on the tranquil skies:  
Rest them from little flames that flare and smite  
By gazing where the myriad suns of night  
Shine with a glow that calms and beautifies.  
Thus when the sounds of pain and strife and hate  
Assail mine ears and grieve and torture me,  
Leaving me, sick of life, to curse at fate,  
I raise my thoughts to regions that are free  
From earthly cares, and there I contemplate  
The silent working of Immensity.

## THE SOURCE OF POVERTY.

A REPLY BY WHEELBARROW TO MR. SOLOMON LEVI'S CRITICISM.

To the Editor of THE OPEN COURT:—

Thanks for allowing me to answer Mr. Levi's criticism. I like to meet a critic who frankly confesses that he comprehends the subject and that I do not. From such a critic I always expect instruction, and seldom get it.

Is Mr. Levi perfectly sure that he "comprehends" the case? His illustrations indicate that he does not. True, a physician finding his patient suffering from headache, indigestion, pains in the side, and cold feet, might wisely say, "These are not four diseases, but four symptoms of one disease," and on that theory he might properly prescribe a single remedy; but suppose four patients afflicted with different disorders, will he treat them all alike? This is more nearly like the case about which we are now holding a consultation, and Mr. Levi's instance does not fit. Society is composed of many persons, some of them healthy and some not. The sick patients have all sorts of disorders, and the cures must be as various as the causes of disease.

"Poverty," says Mr. Levi, "is the real disease"; and he would abolish it by levying a single tax on land. He can as easily remove it with a crowbar. Whatever poverty results from land monopoly will vanish when that monopoly shall cease to be; but the poverty caused by the land system is only a small portion of the aggregate wants and deprivations which go by the name of poverty. Poverty is a consequence, like sorrow, and like sorrow it comes from a thousand springs. The college of physicians was once confounded by a wise man who advised the faculty to abolish "sickness," instead of attacking diphtheria, measles, and fever. "Remove sickness, gentlemen!" he said, "and all the diseases will disappear."

A good many years ago, I lived on the western "frontier." Jerry Dodd was the only doctor in our village, and even he graduated in the blacksmith shop, where he picked up his medical education by physicking horses. Jerry had one infallible remedy for all diseases, from typhoid fever down to corns and bunions. He called it "lobely." It was the only medicine I ever took that would produce sea-sickness on land. No matter what ailed us, he always prescribed "lobely." I once had a painful felon on my thumb, and Jerry made me take a stiff dose of lobely, to remove, he said, "the poverty of the blood." So I am continually meeting with Jerry Dodds, who have a specific for the cure of all social and political ailments, a dose of "lobely" to remove all the poverty of the people.

I can hardly be civil to the doctrine that sobriety and economy reduce wages; but as I used to believe it myself, I will treat it courteously. Will Mr. Levi give us one instance in the United States where sobriety and economy had any such effect? When the temperance movement was spreading among the workmen of England, the brewers and publicans used to employ talkers to go among us and explain that the whole scheme was gotten up by the masters to lower wages, and that whenever it should become evident that we could do without beer, the value of the beer we used to drink would be deducted from our wages. I believed all that for a long time, but at last I noticed that when a man got his wages raised, or was promoted, he was in almost every case a teetotaler. As soon as my eyes were directed towards the actual facts, I saw in a moment that not only was the doctrine false, but that the reverse of it was true. It is amazing that this mischievous error should be revived in the United States!

When and where did Col. Ingersoll say that "the bankbook of a mechanic is a certificate that wages are too high?" Col. Ingersoll has said many eloquently foolish things, but I do not believe he ever said anything so foolish as that. There must be a mistake about the quotation. As to the kindred sentiment, that "It is not men we must try to improve; it is the conditions that make men

what they are that must be altered," I repeat that it has been for ages an obstacle to the progress of mankind. It gives us a cowardly excuse for laziness. It enables us to shift our vices and mistakes from ourselves to our "conditions." It encourages us to shirk our duty, and to desert the moral work set out for us to do. We must try to improve men and their conditions too. The former is the more important action, because improved men will improve conditions long before improved conditions will improve men. I do not think it well to place these two reforms in opposition to each other or in contrast. They should march along step by step together, like two soldiers of the same file.

"A certain man went down from Jerusalem to Jericho, and fell among thieves, which stripped him of his raiment, and wounded him, and departed, leaving him half dead." A priest and a Levite came along, both of them wholesale reformers, and they said, "To help this man would be beneath our dignity; we are not in the retail business. Let us alter the 'conditions' that produce thieves, and highway robbery will cease." Then came a Samaritan and said, "I will gladly assist you to reform society by wholesale, but while we are doing it, I do not think it beneath me to do good in a retail way." So he went to the injured man, "and bound up his wounds, pouring in oil and wine; and set him on his own beast, and brought him to an inn, and took care of him." The moral of this is, work for the removal of suffering wherever you find it. There are many wrongs in our social and political systems, each one producing its own share of poverty. By removing each separate wrong we remove its quota of evil; and the man who thinks he has some stuff in a bottle that will cure everything, is enthusiastically wrong. It is a mistake that a single tax on land will remove the poverty caused by drunkenness, idleness, rheumatism, or falling among thieves. The man who will do nothing to remove our social evils, but levy a single tax on land, simply leaves the victim of injustice to die on the Jericho road.

I have no excuses to offer for the wickedness of the "Coal Barons," who lock up nature's coal cellars and turn the miners out. If I had my way there would not be any coal barons, nor any other "barons" for that matter; but without any further dwelling upon that, I proceed to answer Mr. Levi's question concerning the locked out miners. "Does not Wheelbarrow see that the strictest economy, the temperance of a St. John can be of no avail to those unfortunate men?" Well, no, I do not see any such thing. It appears to me that under the circumstances temperance and economy must be of great avail. It is easy to say that they have been deprived of "the right to the use of the earth," and I rather think myself that they ought to have the coal mines; at least I wish they had them, but would they not be coal barons then? And suppose I should go there with my shovel, pickaxe, and wheelbarrow, and begin digging coal for a living, how long would it take them to fire me out of the mine? And if I should tell them that I had a "right to the use of the earth," they would say, "Yes, but not to that part of the earth which your neighbor has a right to the use of." And how could I answer that? Phil. Fogarty, an Irish friend of mine, was president of the land league, and one day he told me that he had hired a man to kill landlords.

"What do you pay him for the job?"

"I give him a hundred and sixty acres of land for every landlord he kills."

"What if he kill ten landlords?"

"Then he will get sixteen hundred acres of land."

"Why, that will make him a landlord; will it not?"

"Yes, but I have a man ready to kill him then."

While Mr. Levi is abolishing the "conditions" which produce "coal barons," let him be careful that he substitute not some new "conditions" that will create new "barons."

All poverty will not be removed by sobriety and thrift, but

they will abolish that part of it which has been caused by improvidence and drink. I think these propositions are self-evident, yet Mr. Levi thinks the result of them would be to reduce us "to a mere animal existence." The man who believes that self-discipline, industry, economy, temperance, will reduce those who practice them to "a mere animal existence" probably attaches no definite meaning to such phrases as, "It is not restriction, it is freedom that labor needs?" "Throw open natural opportunities." "Put all men on equal footing in regard to natural bounties by taxing to the fullest extent and for the benefit of the whole community that fund which has been created by the whole community." And so on for several columns. May I ask, "What fund? and why tax it at all? How can taxing a fund created by the whole community be for the benefit of the whole community? All that magniloquence reminds us of the "red-faced man" described by Dickens, who used to stun the company with gong-phrases that might mean anything or nothing. "What's freedom?" said the red-faced man, "Not a standing army. What's a standing army? Not freedom. What's general happiness? Not universal misery. Liberty aint the window tax, is it? Society is bending beneath the yoke of an insolent and factious oligarchy; bowed down by the domination of cruel laws; groaning beneath tyranny and oppression on every hand, at every side, and in every corner."

The man who thinks that there is a "sole cause" for all the poverty, vice, misery, errors and mistakes that abound in society, may call himself an "economist," and a "student of natural law," but he has not been much of a "student" if he has not learned that poverty occasioned by drunkenness, gambling, or even by business imprudence, is not to be removed by levying a tax on land. It is quite in harmony with "natural law" that such an "economist" should bug the delusion that "nothing short of rebuilding our whole social structure will be of any real or lasting benefit to the masses." Why so? Is there any need for such a wholesale change? "Nothing will ever cure that smoky chimney," said the old lady, "except rebuilding the whole house." She had studied just enough "natural law" not to know that rebuilding the chimney might answer every purpose. The rebuilding of "our whole social structure" would be the most tremendous feat of engineering ever done by mortal man since he attempted to scale heaven from the tall towers of Babel; yet there are architects in every town who can furnish in a moment's notice the plans and specifications by which the rebuilding may be easily and successfully done. And the world is distracted by their confusion of tongues.

Familiar and friendly as the clown in the circus, our old acquaintance the "iron law of wages" steps into the arena and says, "Here we are again." Close behind him follows the ancient antithesis known as "the millionaire and tramp, the one the complement of the other." Those veteran bits of rhetoric have done good service; they have earned retirement and a pension. Let them go. The tramp is not the complement of the millionaire nor the millionaire of the tramp. They are distinct social phenomena, the one independent of the other, the tramp a little more independent sometimes than the millionaire. There is a good deal of maudlin sorrow and stumpy pathos wasted upon one specimen of the tramp, and much undeserved reproach upon the other. Rarely is the tramp a sign of want, or even of a scarcity of work. As a picturesque victim of social oppression he is a healthy, rollicking fraud. The stout young fellow who goes on tramp for the gypsy fun of it, and because he would rather beg than work is a despicable creature who ought to be kept on the stone pile; but the laborer who prefers to walk from one part of the country to another, rather than ride, may be as respectable as the man in the palace-car. Neither the one tramp nor the other is chargeable to the millionaire. In this country the tramp is not the product of poverty but of riches. It is not scarcity but abundance that causes the tramp

to blossom in the United States. The fact that a man can get "a meal's vittles" for nothing, almost anywhere in America has developed that contemptible jolly mendicant known as the tramp. As a political argument he is an impostor.

It seems to me that the "student of natural law" utters a contradiction when he says in one paragraph that the millionaire and the tramp "are but creatures of the same natural forces;" and then tells us in another paragraph that "nature is not concerned with the making of millionaires and paupers anymore than with the making of Jews and Catholics." I think they are all the products of artificial forces; although, as to the tramp, nature has had a good deal to do with producing him. Any man who has had much acquaintance with nature in the woods and fields knows the artful way by which she seduces boys from the schoolhouse and men from the shop. The man who has never been a tramp; I don't mean a mendicant, but the tramp who pays his way; the man who has never been a tramp knows not what luxury is. He has never quaffed the wine of life from the chalice of the Gods. He has never felt the holy spirit pouring down upon him from the sun. Health glows in the brown face of the tramp, and nature makes for him a pic-nic and a holiday. Do you like pictures? Tramp through Old England in the spring, or New England in the fall, and roll past you with your own feet a landscape of 20, 30, 40 miles a day. How the glories of the Louvre and the Vatican pale before the groupings and the colorings you will see. In his gilt-edged poetry the millionaire reads about "the music of the spheres," but the tramp actually hears it in that symphony of praise wherein all the harmonies of nature sing together. He drinks a gallon of air at a draught, and consumption and dyspepsia know him not. A pleasant stroll that I can recommend for anybody needing a tonic is a twenty mile-a-day walk across the "pleasant land of France," say from Dieppe, straight away to Strasburg. Let us not waste any more tears on the tramp, nor any more cant.

And this reminds me of "The iron law of wages," which has been imported into this debate. It gives to the argument a learned look, as cap and gown give an air of scholarship to an Oxford student. "The iron law of wages" is an old myth which used to vex and puzzle me, but like some other ghosts it fled when I challenged it. I then discovered that it was unreal, like "The stuff that dreams are made of." It has no more substance than the wooden rule of three, or the leather law of interest. If a figure of speech is needed let us call the law of wages india-rubber, which it resembles. It is elastic; it swells and shrinks, and stretches and bends according to the pressure and resistance of the time. It changes according to the "conditions." Time, place, and circumstance; crops, climate, capital; product, strength, skill, character, and a thousand other forces control and modify the law of wages, if there is any law of wages other than the law of price for groceries, the law of getting the most sugar and the most labor for the least money?

I once held the position of deputy bricklayer. I carried the bricks up in a hod, while my principal set them in the wall. He was a labor-orator and a good one. Did you ever hear a sailor box the compass? Well, that's the way my principal used to rattle off the jargon of the "dismal science." The pathetic way in which he would explain the "iron law of wages," used to make us all so thirsty from shedding tears, that we had to call for beer. One day we had this dialogue:

"Jem," I said, "what is the iron law of wages?"

"O, it's the law which allows a working man just wages enough to purchase the necessities of life, and keep his muscles in working order."

"Does it cost any more to keep your muscles in working order than mine?"

"No."

"Then how comes it that you get three dollars a day, and I only get a dollar and a quarter?"

"Well, of course, you know, skilled labor is more valuable than unskilled labor in the market."

"Then the value of the article in the market has something to do with the price of it?"

"Certainly."

"And there is no iron law?"

"Yes, there is; for the lowest forms of labor, but not for the higher."

"This," I said, "amounts to a confession that there is no 'iron law of wages.'"

Mr. Levi hopes and expects too much from the land scheme of Henry George. That scheme was lifted into popularity by the eloquence of its advocate as much as by its own merits, and in spite of its mistakes. The moral defect of it is that it makes taxation a principle. It elevates taxes to the rank of blessings. Taxes always deprive society of some comforts; they never can increase its wealth, any more than levying meases upon a special few can increase the health of all. The paradox is visible in Mr. Levi's proposal to abolish poverty "by abolishing all taxation upon the products of labor, and putting it upon land values, taxing them to the last penny." What are land values but the "products of labor." And why confiscate land values "to the last penny?" The only revenue that any government can obtain by taxing land values must come from the values which are the product of labor. The speculative land value of a vacant lot, the anticipated profits of an uncultivated "quarter section," will yield nothing to the tax-gatherer, if assessed to the "last penny" of its prospective worth. In this case the land and the lot will simply be forfeited by the owner to the State, and if conferred upon a new owner they will not yield the first penny in taxes or in profits until they have been made productive by the magic touch of labor. There is much in Mr. George's land scheme that appears to me to be correct, and some of it I advocated in a crude way before Mr. George was known as an author. I think there is a good deal of social relief in the principle of the single tax on land, as being the least impediment to labor; but I do not see how that relief can ever be greater than the sum total of the taxes required for the strict necessities of government. Mr. George is not to be held responsible for the views of his disciples, but many of them believe that under his plan every man who owns lands and lots is to be fined for the offense "to the last penny" of their value.

The personal questions addressed to me in Mr. Levi's last paragraph must be answered. *First*, "Does Wheelbarrow go down below the surface and wrestle with evil in the place of its origin?" To that I answer, yes; as well as I can; but I see a thousand origins of evil, and to the best of my ability I wrestle with them all. I give such help as I can to every reformer, and to every reform. I complain that progress is retarded because reformers will not assist each other. "A single tax on land is the only way to relieve poverty," says one. "Wrong," says another, "State Socialism is the only cure for poverty." "Both wrong," says a third, "Money reform is the one thing useful." "All wrong," says a fourth, "Prohibition of the liquor traffic will remove all poverty," and so on, until the relief of individual misery is looked upon as very unprofessional in a wholesale reformer. Whenever I see anything in any man's plan that I think will remove evil either by wholesale or by retail, I am his disciple.

*Second*, "Does Wheelbarrow intend to give labor back the right to the use of the earth?" To that I answer, yes; and when labor uses the earth, I would not tax its product as a punishment for using it.

Respectfully,

WHEELBARROW.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXIII.—Continued.

Now Mrs. Knips (who dwelt opposite to the actress) came running in to Madame Hummel one day with the linen still damp, and told her that on the previous evening a great basket of champagne had been taken to the actress's house, and that in the night the loud singing of a dissolute company had been heard over the whole street, and that young Doctor Hahn had been among them!

On Sunday the comedian had been invited to dinner at Mr. Hummel's, and one of his first anecdotes was concerning a jovial party which had taken place at the actress's. With the malice which is often to be found in fellow-artists towards each other, he added, "She has found a new admirer, the son of your neighbor over the way. Well! the father's money will at least come to the support of art." Mr. Hummel opened his eyes and shook his head, but only said, "So Fritz Hahn too has gone among the actors and become dissipated: he is the last one that I should have suspected of this."

Mrs. Hummel endeavored to bring to mind her recollections of the ball, and found in them a sorrowful confirmation of this, but Laura, who had been sitting very pale and silent, broke forth vehemently to the actor:

"I will not suffer you to speak of the Doctor in such a tone at our table. We are well enough acquainted with him to know that he is in conduct and principles a noble man. He is master of his own actions, and if he likes the lady and visits her at times, a third person has no right to say anything in the matter whatever. It is a malicious calumny to say that he goes there with any dishonorable intentions, and spends money that does not belong to him."

The comedian, through fright, got a crumb of bread in his wind-pipe, and burst out in the most violent fit of coughing that had ever seized him, but the mother, in excuse of their pleasant visitor, replied:

"You have sometimes felt yourself, that the conduct of the Doctor was not quite the thing."

"If I have said anything of the kind in foolish ill temper," cried Laura, "it was an injustice, and I am very sorry for it; I have only the excuse that I never meant it ill-naturedly. But from others I will hear no slanderous talk about our neighbor." She rose from table and left the room. The actor vindicated himself to the mother, but Mr. Hummel grasped his wine-glass and, peering after his daughter, said:

"On a gloomy day she is scarcely to be distinguished from me."

The Doctor was little troubled about his own mis-

\* Translation copyrighted.

deeds. He had paid a visit to his partner after the ball, the occasion on which he had been seen at the window. One of his school friends, now second tenor at the theatre, had come and arranged with the actress to have a little picnic on her approaching birthday, and Fritz had been invited to take part in it. It was a merry gathering, and the Doctor had found much entertainment among the light-winged birds of the stage, and had rejoiced with the benevolence of a wise man at the good tact which was visible amidst the easy style of their intercourse. There had also been much intelligent conversation in the course of the evening, and he went home with the impression that even for a person like himself it was good to be for once associated with these lively artists. He had endeavored that same evening, by a stratagem, to ascertain his unknown correspondent. When they were singing songs, and with lively grace reciting comic verses, he had produced the May-bug song and had begun to sing it:

"The May-bug sat on the hedge, brum, brum;  
The fly sat beneath him, hum, hum hum."

Some had joined in it; the lady in the mantle did not know the song, however, but only a similar one from an old *rôle*; and when the bass took up the melody from the Doctor, and in the following verses portrayed each of the birds as they entered by gestures and comic changes of the melody, the hostess laughed, and without any embarrassment undertook to learn the song, so that the Doctor again became very doubtful, and on returning home remained standing on the threshold and looked significantly at the house of Mr. Hummel. If any one had accurately investigated why, after this May-bug song, the Doctor became noisy and gay like the others, he would perhaps have discovered that the unembarrassed air of the actress had lifted a load from his heart.

But this helped him little with respect to the "brum" and "hum" of the neighbors. All Park Street had latterly accorded to their Fritz Hahn the highest respect; his picture had been placed among the serious men of learning in their albums, whom they daily contemplated and spoke of. Now strange features had appeared in the well-known face, and the street could not bear that one of their children should appear otherwise than he had been wont to do. Therefore there was much whispering and shaking of heads, and this came to the knowledge of Mr. and Mrs. Hahn, and, finally, to the Doctor. He laughed, but he did not feel quite at ease about it.

"Tannhäuser, noble knight and man,  
In Venus' wiles thou liest ensnared,  
While I, a wicked Pope Urban,  
To cause you shame and sorrow dared."

Thus did Laura lament in her room, but she concealed her heavy sorrow, and did not speak a word

concerning the danger of the Doctor, even to Ilse; and when the latter once slightly alluded to the new intimacy of their friend, Laura broke the thread of her embroidery, and said, while the blood rushed to her heart:

"Why should not the Doctor visit there? He is a young man for whom it is good to see different people; he stays too much in his room and with his parents. If I had been a man like him, I should long ago have tied up my bundle and gone out into the world, for our narrow field of active life weakens the energies and dwarfs the mind."

At the tea-table one of the company present turned the conversation on the actress, and shrugged his shoulders over her free manners. Laura felt what must be the Doctor's embarrassment; there sat poor Fritz, obliged to listen to the derogatory criticisms—his intimate acquaintances were silent, and looked significantly at him; his position was terrible, for every fool made use of the lady's unprotected position to show himself a Cato.

"I wonder," she said, "that gentlemen should so severely criticise the little freaks of an actress. A lady of that profession should be treated with great consideration, for she is deprived of all the protection and all the pleasure which we have in our families. I am convinced that she is a worthy and sensitive girl."

The Doctor looked thankfully at her and confirmed her opinion. He did not observe it, but it had happened as in his fairy-tale; Laura had bent down to his feet and picked up the pocket-handkerchief.

But she had still more to bear. The month of March began his theatrical pranks in the world; first from his grey clouds he had cast a veil of snow over the landscape; icicles hung from the roofs and white crystals from the trees, and the wild storm howled all around. Suddenly all was transformed. A mild south wind blew, the buds of the trees swelled, and the fresh green made its appearance in the meadow; the children ran about in the woods and carried home large bunches of spring flowers, and people, rejoicing in the change, passed in unceasing pilgrimage through the Park Street out into the sunshine.

Even Mr. Hummel felt the presage of spring. He gave expression to this annually by mixing the colors for his boat, and taking a pleasure walk on a well-chosen afternoon with his wife and daughter to a distant coffee-garden. This festive journey was but an indifferent pleasure for Laura, for Mr. Hummel walked with sturdy step in front of the ladies; he secretly rejoiced in the renewal of old nature, and only occasionally favored his ladies with a remark over his shoulder when he was annoyed at a change in the vegetation. But Laura knew that her father thought much of this March pleasure, and this year, too, she

went with her mother behind him to a solitary village, where Mr. Hummel smoked his pipe, fed the hens, scolded the waiter, and talked with the landlord about the crops and gave the sun an opportunity of rejoicing in the healthy appearance of his old friend, Mr. Hummel. Mr. Hummel, who was usually by no means averse to society, loved now to be alone with nature, and hated the place of resort of the citizens in the country, where the aroma of new cakes and fritters destroyed the perfume of nature.

When he entered the coffee-garden with his ladies, he saw with dissatisfaction that other guests were already there. He threw an indignant glance on the gay society which had taken possession of his usual place, and noticed among them the young actress, as well as other members of the theatre, and with them the son of his adversary. Then he turned to his daughter and said, blinking his eyes:

"To-day you will be well satisfied; here you have, besides the enjoyments of nature, those of art."

It was a terribly hard trial to which Laura's courage was subjected; but she raised her head proudly, and passed with her parents to another corner of the garden. There she placed herself with her back to the strangers. Nevertheless, she learnt more of their proceedings than was good for her composure. She heard the sounds of laughter, and the merry hum of the May-bug party; the less she saw of them the more painful was the noise, and every sound was audible in the deep stillness, and her mother's ears and eyes also were intent on the other party. After a time the loud conversation of the artists ceased, and she heard her name spoken in low terms. Immediately afterwards the gravel crunched behind her, and she felt that the Doctor was behind her.

He approached the table, greeted the father silently, made some friendly remarks to the mother about the weather, and was just on the point of turning to Laura with a forced composure that did not escape her, when Mr. Hummel, who had till then silently borne the intrusion of the enemy, took his pipe from his mouth, and began, with gentle voice:

"Is what I hear of you possible, Doctor?—that you wish to change your mode of life?"

Laura plunged her parasol vehemently into the gravel.

"I know nothing of it," replied the Doctor, coolly.

"It is reported," continued Mr. Hummel, "that you intend to say farewell to your books and become a professional actor. If this should be the case, I beg of you to think kindly of my little business. I have every kind of artistic head-gear: for lovers fine beaver, with galoon for lackeys, and if ever you act the punchinello, a white felt hat. But you would rather be called clown, perhaps. That is now the fashionable

*rôle*; buffoons are out of style; one shall address you as Sir Clown."

"I have no intention of going on the stage, replied the Doctor; "but if ever the idea should occur to me, I would not come to you for the artistic work of your manufactory, but for instruction in what you consider a good manners. I should then at least know what, in my profession, was *not* befitting men of breeding."

He bowed to the ladies, and went away.

"Always Humboldt," said Mr. Hummel, looking after him.

Laura did not move, but her dark eyebrows were knit so threateningly that Mr. Hummel could not help perceiving it.

"I am quite of your opinion," he said, pleasantly, to his daughter. "It is a great pity that he is spoiled by belonging to these straw-hat people, but now there is no hope for him."

He then took a bit of cake and offered it to a little poodle that was sitting on its hind legs, begging and moving its paws.

"Billy!" cried a lady's voice through the garden.

The dog Billy, however, did not attend, but continued to show his devotion to Mr. Hummel, who, having a greater tenderness for dogs than for men, was feeding him.

The actress came up hastily.

"I beg of you not to give the naughty animal any cake,—there are almonds in it," said the actress, pushing the dog away.

"A pretty dog," replied Mr. Hummel, sitting down.

"If you only knew how clever he was," said the lady; "he knows all kinds of tricks. Show the gentleman what you have learnt, Billy."

She held her parasol out: Billy sprang lightly over it, and bounded into the lap of Mr. Hummel, where he wagged his tail and attempted to lick the friendly gentleman's face.

"He wants to kiss you," said the actress. "You should be proud of that, for he does not do it to every one."

"It is not every one who would like it," replied Mr. Hummel, stroking the little fellow.

"Do not be troublesome to the gentleman, Billy," said the lady, reprovingly.

Mr. Hummel arose and presented the dog to her, which would not desist from his attempts to kiss and lick the face of the worthy citizen.

"He is a simple-hearted creature," said Mr. Hummel, "and is the same color as my dog Spitehahn."

A comparison not at all flattering to the poodle, yet plainly showing that Mr. Hummel was favorably impressed with its mistress.

(To be continued.)

## BOOK REVIEWS.

The *Art Amateur* for September seems to partake a little of the languor of the dog days, for there is no article of great importance in it. "My Note Book" refers to a portrait of Lincoln by one Travis, which it has been suggested that Congress should purchase at the extravagant price of fifteen thousand dollars. It has also various stories of picture sales and other gossip about art.

The ingenuity shown in the manufacture of antiquities is well described. It is a pity that so much skill should not be exercised in legitimate work and sold under its true name. A few words on the "Care of Paintings," may be very useful to those who have them in charge. A new application of the spectroscopic process is in determining the genuineness of gems, as no imitation of their color will give the same lines as the original stone.

A long article gives an account of a French seashore town called Etrelat, and is finely illustrated with many sketches by Walter Satterlee.

Many will be interested in the decided and original views of Benjamin Constant, the great French painter, who is shortly expected here to paint a few portraits. A great part of the number is devoted to the *technique* of Decorative Art, and is very suggestive to amateurs working in this direction.

The colored plate represents two birds of Paradise, but hardly succeeds in giving the wonderful subtle beauty of the plumage of these almost fabulous birds. The designs are varied and interesting. The *Art Amateur* has become almost a monthly necessity to those engaged in fancy work.

E. D. C.

GRUNDRISSE DER CHRISTLICHEN GLAUBENS- UND SITTENLEHRE, als Compendium für Studierende und als Leitfaden für den Unterricht an höheren Schulen; by Otto Pfeleiderer. Berlin: 1888. Georg Reimer.

Prof. Pfeleiderer's book, "The Rudiments of Christian Dogmatics and Ethics," is now in its fourth edition,—a substantial tribute to the merits and excellencies of a work upon a subject so prolific of rigid treatment. We might add that its success must indicate more than usual merit from the fact of its appearance in a country where Protestant theology has long since attained a scientific basis, and where cool and impartial investigation of ecclesiastical antecedents has not brought with it the odium of heterodoxy or the curse of miscreancy. In Germany, practical and scientific theology have been developed in independent directions. The ministers of practical faith have worked *pro salute animarum*; the ministers of scientific theology have labored *pro salute veritatis*. In England the process has been different. Anglican theology has invariably been fashioned by the necessities of Anglican faith. Ecclesiastical history, and the criticism of creed in the light of contemporaneous secular tendencies, has never been allowed its proper place in the curriculum of the Anglican theological education. Gibbon was said to be the only ecclesiastical historian of eminence in England—and he an atheist! Cardinal Newman imputes this fault to a well-founded reluctance to investigating the grounds on which the title of Protestantism is founded. "Protestantism," says he, "if anything, is not historical. This is shown in the determination already referred to, of dispensing with historical Christianity and of forming a Christianity from the Bible alone. German Protestantism, on the other hand, has been of a bolder character; it has calmly faced and carefully surveyed the Christianity of eighteen hundred years, and it frankly avows that it is a mere religion of man and the accident of a period. It considers it a syncretism of various opinions springing up in time and place, and forming such combinations one with another as their respective characters admitted."

Let us note briefly in how far Prof. Pfeleiderer has conformed to this historico-scientific method. "Dogmatics," he says, "is

first of all a positive-historical branch of instruction. Since the creed of Christianity is the outcome of the historical rise and growth of the Christian congregation, it follows that it cannot be derived from the simple self-consciousness of the individual, nor from subjective reason, nor from a subjective sense of piety." But its office is, further, apologetic and critical, whereupon the author remarks: "The subject-matter for apologetic treatment can only be the *religious* content of dogma, as serving to determine the devotional character of the congregation, and not the scholastic and formal dress in which dogmatic ideas are clothed; for the latter are based upon the conceptions of the antique world and upon philosophical theories of past ages, and regarded from the altered ways of thinking obtaining at present, they tend more to veil than to express the religious truth of Christianity." Prof. Pfeleiderer says that "in so far as dogmatics conforms in its processes to the established methods of scientific investigation and of rational thought, and in so far as its object is to ensure logical consistency within its own domain and to bring its postulates into consonance with universal knowledge, in so far does it acquire the title and character of a pure science. But in so far as it loses sight of the interests of universal knowledge and aims merely at satisfying the practical religious needs of the Christian congregation, in so far does it relinquish all claim to the correctness and logical necessity of its conclusions, and must be ranked among the practical or technical methods of scientific procedure." Thus, the divisions of the work naturally fall into two parts: the development and analysis of Christian doctrine and of Christian principles as actually evolved in time and place, without the interspersal of ideas suggested by "the subjective sense of piety"; and the history and results of the adaptation of these ideas to the practical needs of the Christian body corporate. As to the latter it is unnecessary for us to say a word; with the exception of an occasional fling at Catholicism, which is pardonable from the evangelical standpoint, the exposition is fair and conformable to facts. But the former may lay claim to unusual excellence; it is a paragon of objective treatment. It is concise and logical; it is comprehensive and flexible. It does not moralize, it is not disputatious, nor discursive. A Mahometan might read it without any fear whatsoever of a corruption of faith. It will suffice to remark that it conforms in every way to the criteria of scientific investigation above quoted from Dr. Pfeleiderer, and may be heartily recommended to those who would acquire an accurate knowledge of Christian doctrine, without being obliged to break their way through the underbrush of controversial debate and sermonizing comment. μικρ.

## NOTES.

We learn with great sorrow of the sad death of Richard A. Proctor.

Prof. E. D. Cope will discuss "The Relation of the Sexes to Government" in the *Popular Science Monthly* for October.

We call attention to the notice in this number by Mr. George Willis Cooke, who is recommended by names as prominent as Mrs. Julia Ward Howe, Edwin D. Mead, etc. Mr. Cooke is the author of "Poets and Problems" and other works on modern literature.

A circular received from Mr. George Stearns informs us that a new work of his "The Pericomic Theory" is ready for press and will be printed as soon as a goodly list of subscribers warrant the publisher against contingent loss on his part of the enterprise. The first chapter of Mr. Stearns' work has been published in THE OPEN COURT, No. 20, under the title, "The Mystery of Gravity." Other parts in chapters are, so far as can be judged from the prospectus, a very interesting attempt at solving the problem.

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost TWELVE YEARS, and the demand is constantly increasing. It is without doubt the VERY BEST JET BLACK ink. We submit the following facts.

1—IT WRITES JET BLACK instantaneously, and you need not wait until the Ink dries to turn black as is the case in most inks.

2—It flows freely and never corrodes.

3—It never freezes.

4—We make it in four sizes:—2-oz. bottles, 15 cts.; half pint bottles, 30 cts.; Pint bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.

If your Stationer or Bookseller does not keep it in stock, write direct to us.

The trade supplied on liberal terms.

## Recent Contributions to 'The Open Court.'

THE FOUNDING OF OUR RELIGIOUS FREE-  
DOM.

By MORGUE D. CONWAY. In No. 52 and 53.

Mr. Conway here discusses a subject that the present Century Era renders timely and interesting. The glorious immunities of civil liberty that our ancestors wrested from the grasp of feudal traditions and confirmed by constitutional bulwarks, were attended perhaps with greater brilliancy and marked by greater effort of acquisition; but, from the standpoint of individual freedom, liberty of conscience and the principle of religious toleration rank not below them in importance. Mr. Conway's story is drawn from unpublished sources, from private manuscripts, and is in the main the result of original research. The state of the Church of England in Virginia, the apostolate of Samuel Davies, the religious tendencies of colonial society, the religious profession of men to become so famous in history, of Randolph, of Patrick Henry, of Madison, and of Jefferson—are all described and discussed, and the manner told in which both the institutions and the men of that era affected and influenced the founding of religious freedom in the United States. The new light which Mr. Conway's research throws upon this important chapter of American history, will be welcomed by all.

THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55 and 56.

In the whole domain of Natural Science no field of investigation affords such a fascinating com-

plexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays will be published at the conclusion of the series.

The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbecomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion.

The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

## REFLEX MOTIONS.

G. H. SCHNEIDER. In No. 24.

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

## BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M.D. In Nos. 27, 29, 31, 33, 34, 35, 36, 40, 42, 44, 45, 48, 51 and 54.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

### WANTED!

An energetic and educated person wanted in every town, city and district, to canvass for subscriptions to *THE OPEN COURT*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,  
Box F., Chicago, Illinois.

### A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

CHAS. W. SMILEY, Publisher,  
Box 536, WASHINGTON, D. C.

### LECTURING.

Mr. GEO. WILLIS COOKE will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. COOKE's address is DENHAM, MASS.

## SHELLS, MINERALS & FOSSILS

—Also—

### SEEDS and PLANTS.

C. R. ORCUTT, Publisher,  
The West American Scientist,  
SAN DIEGO, CALIFORNIA.

### Three Introductory Lectures

## The Science of Thought.

(First published in *THE OPEN COURT* of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

### THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

"Full of novel thought."—*Chicago Herald*.  
"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The absurdity of the theory is manifest."—*New York Science*.

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

"The world-wide reputation of its author, as the greatest living authority on philological subjects, is enough to command the careful perusal and respectful consideration of all who may take up this little book."—*Chicago Legal Advertiser*.

### THE LEADING ORGAN

of British Thought on the American Continent.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,  
TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

AGENTS wanted for religious and economic books, etc. Charles H. Kerr & Co., Publishers, Chicago.

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.\*

BY A. BINET.

Translated from the "*Revue Philosophique*" by *μικρο*.

PART VI.

III.

### THE QUEST AND CAPTURE OF FOODS.

Concerning the prehension of foods and the search for nutriment on the part of Ciliates, we can do no better than to quote entire a note which M. E. Maupas has been pleased to send us upon the subject. We had put to him two questions: *First*, do the Ciliates hunt their food? *Second*, while in quest of live prey, do the Ciliates called hunters make an actual hunt, involving the espial of prey from a distance and the voluntary pursuit of the same in the circuitous paths they follow? M. E. Maupas after having once more had recourse to observation, briefly recapitulates his opinion in the following lines:

"From the standpoint of prehension of food, the Ciliates may be divided into two great groups:

1. Ciliates with alimentary vortices;
2. Hunter Ciliates.

"In the first group the mouth is always held wide open, and along with the nutritive particles which the current of the vortex keeps constantly sucking in, we may at will cause other, absolutely inert and indigestible, particles to take the same course; for instance, such substances as granules of carmine, indigo, and rice-starch. These granules, totally unfit for nutritive purposes, pass through the body of the Ciliates along with the genuine nutriment and are finally cast out intact with the excrement. I think, therefore, we may affirm that the species having alimentary vortices exercise no real choice in selecting their foods, and that they absorb indiscriminately all corpuscles which by reason of their form and density admit of being seized and drawn into the alimentary whirlpool.

"In the case of the hunter Ciliates proper, the mouth is constantly closed. The act of absorbing each object captured is accomplished by a process of deglutition comparable in every phase to the like process in higher animals. Furthermore, these species feed only upon living prey, which they capture and entammel by means of their trichocysts (*vid. Archives de Zoologie*, Vol. I. 1883, p. 607 and ff.). By this very act

they exercise a choice in the selection of food. But this manifestation of choice is not, in my opinion, the result of preference, or of individual taste, but is the consequence of the peculiar construction of their buccal apparatus, which does not enable them to take other and different nourishment.

"These hunter Infusoria are constantly running about in quest of prey; but this constant pursuit is not directed towards one object any more than another. They move rapidly hither and thither, changing their direction every moment, with the part of the body bearing the battery of trichocysts held in advance. When chance has brought them in contact with a victim, they let fly their darts and crush it; at this point of the action they go through certain manœuvres that are prompted by a guiding will. It very seldom happens that the shattered victim remains motionless after direct collision with the mouth of its assailant. The hunter, accordingly, slowly makes his way about the scene of action, turning both right and left in search of his lifeless prey. This search lasts a minute at the most, after which, if not successful in finding his victim, he starts off once more to the chase and resumes his irregular and roving course. These hunters have, in my opinion, no sensory organ whereby they are enabled to determine the presence of prey at a distance; it is only by unceasing and untiring peregrinations both day and night, that they succeed in providing themselves with sustenance. When prey abounds, the collisions are frequent, their quest profitable, and sustenance easy; when scarce, the encounters are correspondingly less frequent, the animal fasts and keeps his Lent. The *Lagnus crassicolis*, accordingly, never sees its victim from a distance and in no case directs its movements more towards one object of prey than towards another. It roams about at random, now to the right and now to the left, impelled merely by its predatory instinct—an instinct developed by its peculiar organic construction, which dooms it to this incessant vagrancy to satisfy the requirements of alimentation.

"The vortical Infusoria, when in a medium abounding in food, are almost entirely sedentary in their habits, only making slight changes of position. But if they are placed in a medium affording but little nutritive material, they become as migratory as the hunt-

\* Translation copyrighted.

ers, and are seen to race about in all directions searching for more abundant nutriment. It is hard to find a more perfect illustration of the influence exerted by the conditions of a medium upon the habits and customs of animals.

"The *Leucophrys patula* is a type distinctively carnivorous and possessed of an extremely voracious appetite, a fact which explains its power of multiplication, one of the greatest I have studied. With a temperature of 25° in my laboratory I have recently seen it separate by fission seven times in twenty-four hours, that is to say, a single individual produces from itself just one hundred and twenty eight others in that time. In constant pursuit of its prey, it seizes its victims by the two stout vibratile lips with which its mouth is armed, and swallows them alive and whole. The victims may be seen struggling and tossing about for a time in the interior of the *Leucophrys's* body and afterwards to expire slowly under the action of the digestive juices of the vacuole in which they have been enclosed. Placed in a medium well-stocked with small Ciliates, the *Leucophrys* have their bodies constantly crammed with victims swallowed in the manner above described. Like the other hunter Ciliates the *Leucophrys* does not espy its victims from a distance and does not guide itself towards them. It simply darts about from right to left, every moment changing its direction. It thus increases its chances of coming in collision with its prey and every time that one of its unfortunate victims falls in contact with its vibratile lips, it is seized, irresistibly drawn towards the mouth and swallowed within less than a tenth of a minute."

Certain hunter Infusoria have methods of pursuit and capture which deserve to be examined separately. Claparède and Lachman in their excellent work upon Infusoria and Rhizopods, have minutely described the manner in which a large Infusory, the *Amphileptus Meleagris*, attacks the *Epistylis plicatilis*. The *Epistylis* are colonizing vorticels of which certain individual members attain a size of not less than 0.21 mm. The *Epistylis* form aborescent groups, the ramifications of which are quite regularly dichotomous. These ramifications all grow at exactly the same rate and the individual branches all rise to the same height, representing what is called, in botany, a corymbose inflorescence. "We were observing one day," says Claparède, "in the hope of seeing what would come of the manœuvre, an *Amphileptus*, which was slowly creeping upon a colony of *Epistylis*. The way in which it approached the Vorticels, feeling them, so to speak, and partly enclosing them in its pliable body, already seemed suspicious. At last, it made a direct attack upon one of them by fastening itself upon the upper part of its body. It opened its huge mouth,

which is never to be seen except when the animal is eating, and slipped over the *Epistylis* like the finger of a glove being drawn upon a finger of the hand. We saw the sides of the buccal aperture (which are capable of being dilated in a truly astonishing manner) slip slowly over the peristome and upon the body of its prey, and then draw together about the point where it was made fast to the pedicle. The cilia covering the body of the *Amphileptus* began to shake with that peculiar motion which is always noticed when a ciliated Infusory secretes a cyst. At the expiration of a moment or so, a fine line was seen to appear around the whole body which continued to spread so as soon to form the cyst." (This might be called a cyst of digestion.) "The phenomenon as a whole is quite simple. An *Amphileptus* approaches an *Epistylis*, devours it and encysts itself upon the spot, the victim being still attached to its pedicle. It then endeavors to wrench the *Epistylis* from its point of attachment by twisting; it turns on its axis from left to right and then from right to left, successively; when it has succeeded, it continues its work of digestion, and occasionally divides in two within the cyst itself. During the last stage of digestion, it rests for a while, when it commences again to turn about in the cyst, evidently seeking to disengage itself. At the close of a certain number of hours, the cyst breaks. The *Amphileptus* issues forth and starts in quest of another victim."<sup>\*</sup>

The hunter Infusoria are frequently armed with *trichocysts*. Trichocysts are urtical filaments which serve the animalcula provided with them to disable or wound other micro-organisms.

A large number of Infusoria, the *Paramecia*, the *Ophryoglena*, etc., use their trichocysts as organs of defense. With other species, of which we shall speak more at length, the trichocysts are organs of offense. They are located either in the sides of the mouth or in parts adjacent thereto; this is the case with the *Lacrymaria*, the *Didinium*, the *Enchelys*, the *Lagynus*, the *Loxophyllum*, and the *Amphileptus*.

These latter animalcula attack the live prey that constitutes their food, in the following manner. They dash upon their victim and bury the trichocysts with which they are armed, into its body. The victim is immediately brought to a halt, whereupon the hunter seizes it and swallows it. So, when the *Lagynus Elongatus* intends to seize a victim that has fallen into its vortex and has thus been drawn into the neighborhood of its mouth, it throws itself swiftly forward. At the moment of contact the hunted Infusory becomes suddenly paralyzed and remains perfectly motionless. This paralysis is evidently caused by the trichocysts which line the œsophagus of the *Lagynus* and with

<sup>\*</sup> *Études sur les Infusoires et les Rhizopodes*, Vol. II. p. 166, 1881.

which the latter has transpierced its prey at the moment it came in contact by its anterior extremity.\*

In a higher stage of organization, the Microzoön possessing a mouth changes its position in order to intercept its prey, and give it chase.

The *Didinium Nasutum* (Stein), a carnivorous Infusory and one of the most voracious of our fresh stagnant waters, operates in a more complicated manner: it casts its trichocysts upon its victim from a distance. The importance of this instance induces us to stop here a moment.

Fig. 7.—*Didinium nasutum*, enlarged two hundred diameters. The figure represents a *Didinium* overpowering a *Paramecium aurelia*. The nettle-like filaments discharged by the *Didinium* are seen on all sides of the *Paramecium*; while the latter, already seized by the tongue-shaped organ of the *Didinium*, is being gradually drawn towards the buccal orifice (after Balbiani).

The *Didinium* (fig. 7), as regards the general shape of the body, may be compared to a diminutive cask, rounded off at one of the ends and terminated at the opposite extremity by an almost level surface from the midst of which rises a conical projection quite strongly

marked. This projection is an organ of deglutition (swallowing); a longitudinal striation is noticed here formed of minute

solid rods, of extreme tenacity and independent of the sides. These organs are the weapons used by the *Didinium* in attacking the live prey which constitutes its sole nourishment.

Not only does it attack and devour animalcula almost as large as itself, but frequently it even seizes individuals of its own kind. In such cases it is always Infusoria, and never the Rotatoria, although the latter often abound in waters which the *Didinium* inhabits. It appears, moreover, to have a marked predilection for certain species; and so it happens that the huge and inoffensive *Paramecium aurelia* is almost always its choice by preference among the animalcula that inhabit the same liquid.†

The prehension of food by the *Didinium* exhibits interesting aspects, which have not as yet been observed in any other Infusory. M. Balbiani, in his first observations, had often been surprised at seeing animalcula that the *Didinium* had passed by without touching, suddenly stop as if violently paralyzed; whereupon our carnivorous specimen straightway approached and seized them with seeming facility. More careful examination of the *Didinium*'s actions soon furnished the key to this enigma. If, while swiftly turning in the water, the *Didinium* happens

into the neighborhood of an animalculum, say a *Paramecium*, which it is going to capture, it begins by casting at it a quantity of bacillary corpuscles which constitute its pharyngeal armature. The *Paramecium* immediately stops swimming, and shows no other sign of vitality than feebly to beat the water with its vibratile cilia; on every side of it the darts lie scattered that were used to strike it. Its enemy then approaches and quickly thrusts forth from its mouth an organ shaped like a tongue, relatively long and resembling a transparent cylindrical rod; the free, extended extremity of this rod it fastens upon some part of the *Paramecium*'s body. The latter is then gradually brought near by the recession of this tongue-shaped organ towards the buccal aperture of the *Didinium*, which opens wide, assuming the shape of a vast funnel in which the prey is swallowed up.\*

Up to this point we have paid little attention to movements of defence and of flight. Upon this subject a few words will suffice. When vorticeles are alarmed, they are seen to contract forcibly their pedicle, which in a state of rest stays extended. Infusoria placed in a preparation where they are at their ease, swim quietly about; if any sharp excitation disturbs them, they accelerate their pace; those armed with a rigid bristle at the posterior extremity, rush precipitately onward whenever another Infusory chanches to touch that tactile appendage. The unaggressive *Paramecia*, when attacked, endeavor to escape, but are also able to defend themselves by means of the trichocysts with which their ectosarc is armed.

#### IV.

Unicellular organisms do not all live in a detached state; a large number of species are found grouped together in colonies; the initial basis of these agglomerations is always a mother cell, the offspring of which instead of dispersing to live at large, remain agglutinated to one another. Ehrenberg had believed that in certain species (especially in the case of the *Anthophysa vegetans*, an aggregation of minute monads growing as a sort of bush) the colony was created by the union of minute organisms that originally lived at large; but observation has shown that his theory was incorrect. It may be laid down as a general rule that every colony of monocellular animals or vegetables spring from the divisions of a single cellule. The cellules of one and the same colony, therefore, are always sister cellules, and the colony represents a family in miniature.

A leading instance of a colony wholly temporary, is found in those organisms the cuticle of which does not take part in the phenomena attending the division

\* Maupas, op. cit., p. 495.

† The *Didinium*, Balbiani tells us, never attacks the *Paramecium bursaria*, which is distinguishable from the *P. aurelia* by its green coloration.

\* *Archives de zoologie expérimentale*, 1873, Vol. II, p. 363. *Observations sur le Didinium nasutum*, by E. G. Balbiani.

of the protoplasm. In this case, the protoplasm beneath the envelope alone divides; the segments resulting therefrom are often numerous, and it is not until the plasma has finished dividing that the maternal cuticle is destroyed and that the segments separate to live abroad in a detached state. Up to that time they remain bound together.

It is thus seen that the existence of this minute colony is a transient phenomenon, which lasts only during the time necessary for the division of the maternal body. These phenomena have been noticed among many of the Flagellates. What appears surprising is, that the maternal cellule, although continuing to divide beneath the envelope, keeps on moving about in the water by means of its own flagellum as if still constituting only a single animal. The reason of this is that one of the segments into which the plasm is divided and which is situated in the anterior part of the mother-cellule, remains connected with the flagellum and takes charge of its movements. This segment (like an individual distinct in itself) alone guides the bark that carries its sisters. And so, although this diminutive colony is as a rule but short-lived, a division of labor has been effected among its members; the anterior segment is alone entrusted with the office of locomotion.

The colony has a duration less ephemeral in the case of the *Gonium pectorale*, a Volvocine known in our fresh waters. It is formed by the aggregation of sixteen individuals which remain detached but adhere laterally to one another. The colony is developed in one way only: it is in the form of a minute rectangular plate of a beautiful green color. In the case of the *Pandorina*, the colony assumes the form of a minute sphere; it is composed of sixteen, or as many as thirty-two individuals, joined together beneath a stout envelope; each member remains free in action, and projects its two flagella through the cuticle. With the *Eudorina elegans*, the colony is modeled upon nearly the same plan excepting that it is composed of thirty-two individuals and that the latter, placed beneath the same cuticle at equal distances apart, do not touch one another.

In the genus *Volvox*, colonies are found of which the structure is very complicated. Such are the great green balls formed by the aggregation of diminutive organisms, which form the surface of the sphere, and are joined together by their envelopes; they have each two flagella, which pass through the enclosing membrane and swing unimpeded on the outside; the envelopes, each tightly holding the other, form hexagonal figures exactly like the cells of a honeycomb. Each *Volvox* is at liberty within its own envelope; but it projects protoplasmic extensions which pass through its cuticle and place it in communication

with its neighbor. It is probable that these protoplasmic filaments act like so many telegraphic threads to establish a network of communication among all the individuals of the same colony; it is necessary, in fact, that these diminutive organisms be in communication with each other in order that their flagella may move in unison and that the entire colony may act as a unit and in obedience to a single impulse. The number of micro-organisms constituting a *Volvox* colony is quite considerable: as many as 12,000 have been counted.

It was upon analogous phenomena that Gruber based the existence of a diffused nervous system in the Stentors. The same line of reasoning may be followed in the case of the *Volvox*. Since unanimity of movement is demonstrable among twelve thousand micro-organisms constituting a colony, it must be inferred that their movements are regulated by the action of a diffused nervous system present in the protoplasm. This conclusion is all the more interesting from the fact that these *Volvox* are vegetable micro-organisms.

In the diœcian *Volvox*, the female cellules and the male cellules are joined together by themselves in separate colonies. When the time of fecundation arrives, the male cellules or antherozoids scatter and proceed to conjugate with the female cellules. The colony which bears the female cellules also contains neutral cellules which are not designed for fecundation; the latter simply perform a locomotive function; equipped with one eye and two flagella, they are intended to move the great colonial ball: they are the oarsmen of the colony. The *Volvox*, male, female, and neutral, all seek the light, whether solar or artificial, and settle near the surface of the water. As soon as the female colonies have been fecundated, the oöspores change their color: they turn from green to an orange yellow. At this point, the colony is seen to draw away from the light and to disappear from the surface of the water. This change of position is effected by means of the vibratile cilia with which each neutral cell is furnished and which project beyond the gelatinous sphere; now, as no change of color or form is noticed in the neutral cells after fecundation, it may be asked from what cause they flee from the light which they formerly sought.

Colonies of Proto-organisms formed by the division of a mother cell of which the segments remain united, are not entirely without analogy with a pluricellular organism which likewise springs from a single cell called the egg, and the resultant divisions of which do not separate.

The colony constitutes in a way a first step towards the physiological constitution of a pluricellular organism; it serves to fix a stage of transition in the animal

kingdom, between Protozoa and Metazoa. A fact which strengthens this analogy is, that certain colonies, as the *Synura uvella* and the *Uroglana volvox*, can divide into two other colonies; strangulation acts upon the mass just as if upon a pluricellular organism. This curious observation was made by Stein and Bütschli.

Nevertheless, an essential difference still separates the Metazoa and the Protozoan colonies, even when in these colonies a division of function has been established among several individual groups. The physiological differentiation brought about in these Protozoan colonies is the result of a mechanism which differs in every respect from that by which it is effected in the case of the Metazoans. In the latter instance the differentiation results from the division of the embryo into *germinative folia* each of which is the origin of a separate group of organs. At a certain stage of development, the superposition of these folia gives rise to the formation of a *gastrula*; the *gastrula* is formed by two folia joined together, representing a pouch open to the outside; it is characteristic of Metazoans, the Protozoan never reaching this stage. Certain colonies observed by Haeckel, the *Magosphera planula* for example, and the *volvox*, of which we have before spoken, appear in the form of a sphere; they suggest an anterior stage of development to which the name of *morula* or of *blastula* has been given; but they do not get beyond this stage.

We have now considered assemblages of organisms which live joined together like the Gonium and sometimes united by a material band like the *Volvox*, where the individuals are grouped together under one and the same cuticle. Voluntary and free combinations are much more rarely met with; nevertheless cases occur. There exist organisms which lead a life of habitual isolation but which understand how to unite for the purpose of attacking prey at the desired time, thus profiting by the superiority which numbers give.

The *Bodo caudatus* is a voracious Flagellate possessed of extraordinary audacity; it combines in troops to attack animalcula one hundred times as large as itself, as the Colpods for instance, which are veritable giants when placed alongside of the *Bodo*. Like a horse attacked by a pack of wolves, the Colpod is soon rendered powerless; twenty, thirty, forty *Bodos* throw themselves upon him, eviscerate and devour him completely (Stein).

All these facts are of primary importance and interest, but it is plain that their interpretation presents difficulties. It may be asked whether the *Bodos* combine designedly in groups of ten or twenty, understanding that they are more powerful when united than when divided. But it is more probable that voluntary combinations for purposes of attack do not take place among these organisms; that would be to grant them

a high mental capacity. We may more readily admit that the meeting of a number of *Bodos* happens by chance; when one of them begins an attack upon a Colpod, the other animalcula lurking in the vicinity dash into the combat to profit by a favorable opportunity.

(To be continued.)

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XV.

#### SOIL AND CLIMATE. (Continued.)

During the golden age of the Mediterranean republics the borderland of the temperate zone and the tropics seemed to unite all the conditions of a superior civilization. For nearly a thousand years Greece, Italy, Asia Minor, Syria, and northern Africa were studded with flourishing cities, while the natives of the higher latitudes had hardly advanced beyond a stage of utter barbarism. The "towns" of pagan Germany were mere fortified camps; the vast region of alluvial plains between the Vistula and the lower Rhine was covered with almost continuous forests, when Mauritania (the modern Morocco) could boast famous seats of learning and Alexandria contained the largest library of the Mediterranean coast-lands.

Time has completely reversed that order. Africa and Asia Minor have relapsed into savagery and nomadism, while northern Germany is a hive of industrial enterprise. Scotland the "home of the frozen Picts," is tilled like a garden, while the "promised land" is covered with desert thorns. Those undeniable facts have tempted several Christian apologists to deny the moral influence of climate and ascribe the blessings of civilization to metaphysical (religious) rather than natural agencies. "Civilization," says Chateaubriand, "has followed the apostles of the cross from the Nile to the banks of the Seine. When St. Augustine ruled the bishopric of Hippo, Africa was Eden and Gaul a wilderness. Now the crescent reigns over a moral and physical desert, while the genius of Christian ethics has made the North the home of culture and happiness. The religion of love has effectually changed the social condition of this planet."

The main key to the enigma of that change can, however, be found in the circumstance that the civilization of a healthy wilderness is a far easier task than the redemption of an exhausted soil. Twenty years after the followers of Daniel Boone entered the "dark and bloody ground" of the Kentucky woodlands those woods rescinded with the hum of traffic and the music of school-bells. Twenty centuries of irrigation and tillage would hardly suffice to restore the promised land to its former state of productiveness. One by

\* Copyrighted.

one the nations of the Mediterranean paradise were overtaken by the marasmus of decrepitude—a disease for which the resources of science seem to offer no remedy. The wild hunters of the north were for ages contented with the freedom of their native woods, but long before their succession to the political supremacy of this planet they were *potentially* the superiors of their cultured neighbors. Cyrus the Great, who defeated his southern rivals almost as easily as the Macedonian invaders afterwards defeated his successors, had to pay his mistake with his life when he undertook to meddle with the savage tribes of the Massagetæ—probably the ancestors of the Ostrogoths. Darius Hystaspes, with all his western auxiliaries, barely escaped a similar fate on his campaign against the independent Scythians. Four centuries before the beginning of our chronological era two tribes of savage Gauls cut their way through northern Italy, routed the Umbrians, routed the Etruscans, routed the armies of republican Rome, entered Rome itself, and retreated only upon payment of an enormous bribe. A hundred years after, i. e., during the very zenith-period of Grecian civilization, a second swarm crossed the borders of Macedonia, fought their way across the Hellespont and conquered large portions of Syria and Asia Minor. Neither discipline nor superior arms could avert the fate of Rome when the Visigoths crossed the Danube *en masse*. A rare conjunction of favorable circumstances enabled the Saracens to accomplish the conquest of Spain before the subjects of the Gothic monarch had recovered from their first surprise; but already a century after the battle of Xeres de la Frontera we find Gothic chieftains bearding the Moors in their southern strongholds. Fernan Gonzales (born A. D. 887) reconquered Burgos and Salamanca. Fernando III., captured Cordova and expelled the Moors from Seville after the prestige of their power had already received a fatal check on the battlefield of Tours, where the iron fists of the Northland warriors prevailed against the superior tactics and fanatical valor of their opponents.

For the next thousand years the history of Europe records, indeed, an almost uninterrupted series of victories of northern nations over their southern neighbors. "Civilization," during that age of iron and blood, changed hands almost as readily as political power. The seeds of culture sprouted in the soil of the higher latitudes, the victors inherited the arts, the science, and the industries, as well as the wealth of the vanquished; and the usual concomitants of defeat, servility and indolence, completed the degradation of the fallen races. Now and then the fortune of war alone has forever decided the fate of a valiant nation by the actual extirpation of all its able men, as in the battle of Vercellæ where the entire force of the Cimbri was

not only routed, but slain, by the legions of Marius, or on the plateau of Gunib, where the Russians annihilated the most warlike tribe of the Circassian highlanders. As a rule, though, degeneration precedes such defeats, or makes their consequences more fatal. The disastrous folly of the Crusades cost the nations of Christendom more than a million lives, representing the very flower of their chivalry; yet the homes of the slain heroes still nourished the roots of valor, and a few years of peace healed the wounds of war, as spring heals the havoc of winter. But spring and summer return in vain where the soil itself has lost its reproductive force, and worn-out Syria will perhaps never recover from the storm of conquest that has swept her plains like the blast of the blighting simoom; on the barren hills of Greece the sunshine of a hundred peaceful years would not revive the buried age of the Olympic festivals; and the civil wars of Spain have probably sealed the fate of an exhausted nation. The flowers of civilization have the earliest faded where they developed their earliest buds. Instead of arresting that decay, the delusions of supernaturalism have unquestionably accelerated its progress. The world-renouncing fanaticism of the early Church contributed more to the ruin of the Roman Empire than world-conquering ambition of the Gothic warriors. "That Church," says Lecky, "consisted of men who regarded the Roman government as a manifestation of Antichrist, and who looked forward with passionate longing to its destruction. It did its utmost to substitute a new enthusiasm for that patriotism which was the very life-blood of the national existence. Many of the Christians deemed it wrong to fight for their country. All of them aspired to a type of character and were actuated by hopes and motives wholly inconsistent with that proud martial ardor by which the triumphs of Rome had been won, and by which alone her impending ruin could be averted." (*History of Morals*, Vol. I. p. 413.)

"Not to the division of the Empire Rome owed her downfall," says Heine, "but on the Tiber as on the Bosphorus her strength was consumed by the poison of dogmas, and here, as there, Roman history became the chronicle of a wasting disease, of an agony prolonged for centuries of hopeless decline. Does it not seem as if outraged Asia had avenged her wrongs by the fatal gift of that creed—as fatal to the victor as the shirt which the dying Centaur poisoned with his own blood to avenge his death at the hands of a resistless conqueror? Rome, the Hercules of Nations, was consumed by the virulence of that poison till helmet and shield dropped from the nerveless body and the voice of battle-shouting heroes died down to the whimper of praying priests. . . . The dogmas of that creed spread with the rapidity of a pandemic plague;

throughout the Middle Ages the fever raged in paroxysms of fitful fury, and the tremor of exhaustion still weakens the nerves of the present generation." (History of Religion and Philosophy, p. 11.)

"The monody of Libanius\* was the dirge of pagan civilization. As soon as the light of philosophy had faded, the vampires of superstition became aggressive, and for the next thousand years the moral history of Europe is the history of an unrelenting war against Nature, a war which systematically promoted the survival of the unfit by making common sense a stigma and free inquiry a capital crime. . . . Between the morning-light of pagan philosophy and the evening-light of modern science intervened a thousand years' eclipse of human reason, a millennium of madness and misery which, but for that unnatural night, might have been the happiest period in the history of mankind. The rule of superstition robbed the Germanic nations of the spring-time of their national development. When they awakened from the morning-slumber of their political infancy they found themselves in the coils of a strangling serpent, and the prime of their strength, which might have won them the golden prizes of the international arena, had to be wasted in the struggle against the monster that threatened to crush out their reason and their life. In that struggle for life and light, the Hercules of the North finally prevailed, but the Apollo of the South succumbed to the Python; the Mediterranean paradise was forever lost." (Secret of the East, p. 63.)

"The refuge of the convents," says Blanqui, "was doubtless a welcome retreat to the oppressed, but the human race never suffered a more cruel outrage, industry never received a wound better calculated to plunge the world back into the darkness of the rudest antiquity. It suffices to say that the prediction of the approaching end of the world,—a rumor industriously spread by the rapacious monks of that time, was received without terror." (*Résumé de l'Histoire du Commerce*, p. 156.)

The sophism of Chateaubriand can therefore be reduced to the fact that the age of superstition, though it greatly retarded, did not altogether prevent the civilization of the northern nations, and that nature at last prevailed in the struggle between the normal influence of climate and the abnormal influence of a far-spread moral epidemic.

Vice, *per se*, cannot adequately account for the degeneration of southern nations, though as a collateral explanation, it may be accepted in connection with the circumstance that *in the south the besetting foibles of mankind can be indulged with less impunity than in the climate of the colder latitudes*. Frost is an antiseptic. The yearly experience of our southern states

demonstrates the truth that malarial diseases can develop their epidemic forms only during the warmer seasons, and that even in midsummer they rarely spread beyond a certain degree of altitude or latitude. The first frost generally puts a stop to the ravages of yellow fever. The deadliness of that disorder increases as we approach the tropics, and there is no doubt that intemperance is one of its chief pre-disposing causes. "From my own knowledge," says the author of "Tropical Diseases," "as well as from the observation of others, I aver that those who drink nothing but water or make it their principal drink, are but little affected by the climate, can undergo the greatest fatigue without inconvenience, and are less subject to the contagion of troublesome or dangerous diseases." "For twenty years," Dr. L. C. Ward writes from Sumatra, "I have had the opportunity of observing the comparative effects of the use of spirituous liquors and less stimulating drinks by different classes of the natives, and I find that while the former expose themselves with impunity to every degree of heat, cold, and wet, the latter can endure neither wet nor cold, for even a short period, without great danger to their health."

The diseases aggravated by the influence of habitual intemperance are not wholly limited to the lower latitudes. "The use of alcoholic drinks," says Dr. R. E. Adams, "I have found to be a great pre-disposing cause of malignant disorders. So strong is my opinion on this point that, were I one of the authorities and had the power, I would placard every rum-shop in town with the words: 'Cholera sold here!'"

Cholera has repeatedly spread as far north as Edinburgh and Boston, but, as in yellow fever epidemics, the percentage of mortality increases with the distance from the poles, and for one Scotchman or New Englander victimized by such consequences of intemperance, a dozen Southlanders would risk to pay their vice with their lives, or transmit to generations of their offspring the indirect penalties of a ruined constitution.

The effects of gluttony, too, are counteracted by the antidote of a low temperature. "High livers should emigrate to high latitudes," writes Dr. Atkinson from the banks of the Lena, "in this climate it is certainly difficult, if not actually impossible, to eat to a physically damaging excess. I have put myself outside of plate after plate-full of fried gull's eggs, fried fish, fried seal-liver, with *entremets* of caviare and toast, till I felt positively ashamed of myself, but my appetite failed to diminish, and the deserved consequences forgot to arrive. A temperature of fifteen degrees under zero in September seems to compensate its victims by making them surfeit-proof." A little further south that immunity is less absolute; but even in the latitude of New England we find that the consequences

\*On the death of the Emperor Julian, A. D. 363.

of gastronomic excesses are less disastrous in mid-winter than in midsummer. Gastric chills, cholera morbus, and acute dyspepsia are ten times more frequent in July than in August, and the gluttons of the lower latitudes have to pay a proportionally heavier penalty. Luigi Cornaro, the Venetian reformer estimates that by dietetic excess alone, his next relatives had shortened their normal life-term some thirty per cent. His father, his uncle, his brother, and several of his cousins had all died before the attainment of their fiftieth year, while their philosophical relative died a week before the celebration of his hundredth birthday. To accomplish his purpose, he had, however, to restrict himself to a daily allowance of twelve ounces of solid food and fourteen of fluids, while several northern centenarians (Parr, Jenkins, Ivan Dapowski, etc.) though abstemious in the use of strong drink, were anything but sparing eaters.

Nearly every form of hereditary disorder assumes a more malignant form in the climate of the lower latitudes, and the history of superstition would almost tempt us to apply the same rule to certain moral and mental aberrations. Only under the influence of a torrid climate crimes against nature could be practiced in the name of religion (*vid. the ne-plus-ultras* mentioned in Letourneau's *Sociology*, pp. 64, 71 and 72), and only under the sun of the tropics credulity could degenerate into an actual love of the absurd for its own sake—a passion for portents redeemed neither by pathos nor fancy. The miracle legends of the north are mere trifles compared with the prodigies of the Mediterranean creeds, which in their turn are distanced by the limitless absurdities of the Hindoo scriptures. "Among an immense number of similar facts," says Henry Buckle, "we find it recorded that in ancient times the duration of the life of common men was 80,000 years, and that holy men lived to be upwards of 100,000. Some died a little sooner, others a little later; but in the most flourishing period of antiquity, if we take all classes together, 100,000 years was the average. Of one king, whose name was Yudhishtir, it is casually mentioned that he reigned 27,000 years, while another, called Alarka reigned 66,000. They were cut off in their prime, since there are several instances of the early poets living about half a million. But the most remarkable case is that of a very shining character in Indian history, who united in his single person the functions of a king and a saint. This eminent man lived in a pure and virtuous age, and his days were, indeed, long in the land, since, when he was made king, he was *two million* years old; he then reigned 6,300,000 years, having done which, he resigned his empire and lingered on for some 100,000 years more." (*History of Civilization*, p. 97.)

In the latitude of the North German woodlands, on the other hand, even the comparatively modest miracles of the trinitarian missionaries were accepted only under protest, and for nearly seven centuries a latent skepticism awaited the opportunity offered at last in the outbreak of the Protestant Revolt.

(To be continued.)

#### THE ETHICS OF LITERARY DISCUSSION.

The ethics of literary discussion can be expressed in one sentence: Let the search for truth be your supreme maxim to which all other interests must be subordinate and subservient. Controversies which (not unlike duels) are waged for mere personal matters, have either to conform to this ethical maxim, or if they do not, they will be recognized as downright unethical or at least non-ethical.

The following rules are derived from the ethical maxim of literary discussion:

Never defend an opinion which you do not believe yourself. Never accept a belief which is not demonstrable. You must not only be convinced that it is so, but your arguments must be strong enough to convince impartial readers.

Strength of argument rests on the following conditions:

1. The facts upon which it is based, must be well established.
2. These facts must cover the whole field, so as to be exhaustive as instances.
3. The reasoning must be logical.
4. The presentation of the argument must be lucid.
5. Your presentation cannot be lucid if you are not clear yourself. Accordingly, you must be ready to define every word you use.
6. Technical terms should not be employed unless their definitions are given.
7. Be careful that your words and especially your terms are used as they are commonly understood and not in a double or ambiguous sense.
8. Make the main points prominent and do not lose yourself in matters of detail, however interesting those details may be. They draw the attention of your readers and of yourself from the main subject.

These rules being observed, you can fearlessly await the most powerful adversary.

Before attacking the position of your adversary, try to understand his arguments from his standpoint. Acknowledge fully where your adversary is right.

Where he uses an ambiguous term, state plainly in what sense the term would be allowable.

This is a matter of justice due to your adversary. To show justice in this way is advantageous first, to your opponent, and then, perhaps in a higher degree, to yourself, and what is most important, to the

problem under discussion. It clears the situation and you thus limit the field of controversy to those points where you know your adversary to be wrong.

The points of agreement have become neutral ground which, it is true, your adversary can use for an honest retreat, if he chooses. However, his annihilation is not the object of the discussion, but the elucidation of truth. If he does not choose the chance of an honest retreat, his defeat will be the more inevitable, the more carefully the field of contest has been limited to his errors.

The weakness of an opponent is generally supposed to be the strength of his antagonist. This is utterly false. It must be a poor cause you defend, if it profits by the weakness of its adversaries. The strength of an adversary adds to your own strength if you defend a cause that is worth defending.

The weakness of an adversary lowers you down to his own intellectual weakness. Therefore, do not have any discussion with weak opponents, and if you cannot avoid an encounter, do not take advantage of their weakness. The common issue is lost sight of by abusing an adversary for his weakness, ignorance, or faults. Consequently, you being the stronger, the duty of helping and promoting your adversary devolves on you. This should be done without ado, simply by giving information.

If your adversary uses rude language or derogatory expressions, there is no need of following his example or of attempting to out do him. Either do not answer his rant at all, or if you cannot avoid giving an answer, ignore all personal disparagement and confine your comments to the cause at issue. If you adopt the railing method of your adversary, you lower yourself to his moral inferiority.

Never use sophisms.

Sophisms easily impose upon large masses, but they do not delude the few independent thinkers who are perhaps silent by-standers. The ultimate result has never as yet depended upon the masses who judge rashly, but upon the judgment of the few independent thinkers who judge slowly but in most cases justly.

Sophisms are dangerous to the parties who employ them; sophisms will ultimately fall back and harm their own inventor. By using sophisms you venture on untenable ground, there to plant your colors, and if your enemy is on the alert, you will lose not only the position but your colors also. Sophisms afford incidental and transitory advantages.

If your adversary by negligence shows a hidden weakness or is guilty of a self-contradiction, point it out to him, stating at the same time how he should have expressed himself from his own standpoint. If his negligence is merely carelessness of verbal expression, you have settled the point for good. However, if

the self-contradiction lies deeper, you have thus limited the field of discussion (as suggested above) to those points where the difference of the issues at stake will be seen to be primary and radical.

This always is the end toward which all honest and well directed discussion must tend. Even if the disputants can not gain the best of one another, their discussion must elucidate the problem about which the discussion is waged. The disputants must learn by their discussion in how far they agree and wherein their differences consist: whether it is only a difference of words (which happens much oftener than is generally imagined), or a material difference. If it is a material difference, we must find out by the discussion, whether the difference is fundamental, *i. e.*, whether the parties disagree because they start from different principles (which they have accepted as axioms) or whether it is a different interpretation of facts acknowledged by both parties, or whether one party takes its stand on facts which are not recognized by the other party as sufficiently established.

Whatever should be the result of a discussion conducted upon such ethical maxims, the discussion would never be entirely useless, but would be valuable in exact proportion to the issue at stake and the combined abilities of both opponents.

P. C.

#### ON THE LIFE AND LETTERS OF CHARLES DARWIN.\*

BY THE REV. H. R. HIGGINS.

The biography of Darwin affords a reasonable hope that, amongst the abundant and diversified materials therein contained, the key to his success may be found. Mr. Darwin himself thought so. He was at much pains to put on record his own habits and modes of thought, if they were at all likely to be of service to those who should follow him in the pursuit of truth.

Certain reminiscences he himself labelled "important." Two or three of these will be given from the *Autobiography*.

VOL. I. Dating from the Parallel Roads of Glen Roy, Mr. Darwin writes, p. 69:—

"Because no other explanation was possible under the then state of our knowledge, I argued in favor of sea action, *i. e.*, by the elevation and withdrawal of the sea, and my error has been a good lesson to me never to trust in science to the principle of exclusion."

Hasty and over-confident observers are apt to conclude that they know all possible causes for an event, and have only to choose between them. If, then, three or four causes, or apparently all but one, will not fit, they are quite positive the remaining one must be the right cause—there is nothing else left for it, so say they. This is the principle of exclusion, to which Mr. Darwin had learned never to trust in science; and it is the principle on which a well-known writer has built up man's pedigree, step by step, for twenty-three stages, from an Amoeba to the human race.

*Autobiography*, p. 87:—

"I had also, during many years, followed a golden rule, namely, that whenever a published fact, a new observation or a thought, came across me, which was opposed to my general results, to make a memorandum of it without fail, for I had found by experience that such facts and thoughts were far more apt to escape from the memory than favorable ones."

Perhaps this practice of itself might be sufficient to distinguish Mr. Darwin from ordinary men. We are surprised that there are

\* Read before the Literary and Philosophical Society in Liverpool, 1887-88.

not more scientific men doing Darwin's kind of work, but how few are ready to give the amount of respectful attention which he did, when facts occur opposed to the "general results" of their thoughts!

In *Reminiscences*, his biographer writes, p. 148:—

"There was one quality of mind which seemed to be of special and extreme advantage in leading him to make discoveries. It was the power of never letting exceptions pass unnoticed."

In Mr. Darwin's pursuit, biology, there is a strong tendency in exceptions to become excessively odious. We need not wonder that the naturalist who never blinked an exception was the one who took the lead in the pursuit after truth.

All these characteristics point to a man of iron determination, merciless to his own foibles. How strong in us are our scientific foibles, and how they beg and entreat to be spared! Few besides naturalists know how powerful is the *Σταγύη* of a scientific writer for the hypothesis over which he has brooded. Darwin was the man to sacrifice all this, thus becoming the man whom Nature hath delighted to honor.

Some of us, and I for one, hold that Darwin's fame would have been dearly bought had it been reached through the bondage of a heart of iron which knew no beat of tenderness nor anything of the throbbing of deep affection.

It was not so with Darwin. Kind-heartedness meanders, like a stream, through all his correspondence, and one brief word shall represent the feelings which dwelt in the home circle. *Reminiscences*, p. 134. The occasion was the death of his daughter, Annie:—

"We have lost the joy of the household and the solace of our old age. She must have known how we loved her. O, that she could now know how deeply, how tenderly, we do still love her dear joyous face! Blessings on her!"

The last of my little notices on Vol. I shall be assigned to Darwin's great work on the *Cirripedes*, the only monograph he wrote; and to this he devoted eight years of his life.

It was the admirable character of this monograph, and the excellence of its descriptions, which enabled me in 1880 to identify the nameless contents of a large box of *Cirripedes*, bought by me in London for the Liverpool Museum, with Darwin's own work. They turned out to be the duplicates of the "Beagle" collection, made by Mr. Darwin's own hands. As a relic, they are the greatest treasure we have in the Museum, and still seem to say—At this lowly group of animals DARWIN worked for eight years.

VOL. II. A distinction of no ordinary kind was conferred on the proposed life of Darwin, when Professor Huxley undertook to write in it a chapter on the "Reception of the *Origin of Species*."

The Professor would probably assert that more honor was reflected than conferred by his part in commemorating the life of one whom he ranks with Isaac Newton and Michael Faraday. But a large class of readers will find as much interest in observing the way in which the subject is now treated by Professor Huxley, as in learning the incidents of the struggle through which Darwinism became established.

No living man, more graphically than Huxley, could have described the tactics of the opposition, or enriched the narrative with more telling anecdotes; but whoever opens Vol. II, Chap. V, with the hope and expectation of finding stores of fresh materials for a damaging case against Mr. Darwin's opponents, may perhaps be disappointed.

Professor Huxley does not withhold his condemnation of such as would not fight fairly; but neither does he exult in magnifying the unworthiness of the combatants who were overthrown. Later on, in the same volume, occurs an account of the conflict waged at the Oxford Meeting of the British Association in 1860, between Professor Huxley and the Bishop of Oxford, on which memorable occasion the writer was present.

The narrative does not appear to be at all overdrawn, but the writer is glad to believe that a similar passage at arms could not

now occur, inasmuch as there is not a bishop on the bench who does not admit the necessity of treating the subject at least with grave respect.

A motto for this portion of the second volume of Darwin's life might read—Times are changed and we are changed with them. Thirty years ago evolution seemed to carry the black flag, bearing a death's head and crossbones. There is no longer any consistency in renouncing for evolution's sake all that chiefly makes man's life lovely and hopeful.

A deep impression is abroad, though somewhat silently entertained, that Christians and heathen, bishops and philosophers, are all sailing on the same bottom; and, to carry on the metaphor, that the most valuable and reliable seamen are not those who are the loudest renouncers of all old treatises on navigation, but such as do their utmost to make whatever is good and true in the old, work in with the new.

(To be concluded.)

## RICARDO ANTONIO PROCTOR

VIRO PRÆDITO VIRTUTE MNEMONYNON.

BY M. C. O'BYRNE.

The murmuring rill in ocean finds its death,

So glides man's life toward the gloomy portal:

Alas! how speedily of every mortal

The memory fades, as fades the parting breath.\*

To nobly live the sage's life resigned,

For human good its calm career pursuing,—

Or nobly die for man and man's well-doing,

Alike becomes and proves the generous mind.†

Inspired and cheered by all who knew its worth,—

The hope of fame with altruism blending,—

Such Proctor's life, whose all-unlooked for ending  
Awoke a chord of sorrow round the earth.

No fav'r'er he of mysteries profound;

His keen eye searched the cosmos to discover

His hidden meanings, while of Truth a lover

He scorned to feign when angry bigots frowned.

In him reviv'd, we saw the generous fire

That glowed in Bruno's gallant bosom burning;

From Falsehood's compromise with horror turning,

As Bruno spurned the cross from out the pyre.‡

Thrice noble Indagator! thou shalt live

In minds whose form is partly thine,—preparing

The way to "vaster issues," still declaring

The glory of the bounty God doth give.

God—the Eternal Order—Being—All:

Of whom we are, in whom we shall be ever;

Changing through all, but deviating never,

Though suns grow dark, men die, or sparrows fall.

\* φθὺν, τοῦ θανόντος ὡς ταχὺ τις βροτοῖς.

χάρης διαβήτης—Sophocles, *Ajax*, 1266-7.

† ἀλλ' ἢ καλῶς ζῆν, ἢ καλῶς τεθνηῆναι.

τὸν εὐγενῆ χροῖ.—*Ibid.* 479-80.

‡ In 1875, Mr. Proctor, upon being informed that certain of his scientific opinions and teachings were opposed to Catholic doctrine, unreservedly abjured and withdrew from the Roman Catholic Church. In 1878, when a well-known London minister alluded to the terrible loss of life resulting from the sinking of the *Princess Alice*, as an example of God's mercy to the survivors, Mr. Proctor and the writer of these lines entered forcible protests against such pulpit utterances. In one of his letters on this occasion, Mr. Proctor wrote thus: "No wonder clergymen complain that Atheism, or what they take to be Atheism, is spreading. Better a hundred-fold to believe in no God at all, than to believe in such a God as some of them picture to us."

## BOOK REVIEWS.

SILAS LAPHAM. *W. D. Howells*. Boston: Ticknor & Co.

The above publishing firm follow the paper edition of Mr. Howell's *Indian Summer* with the issue of Silas Lapham, in the minds of many the author's most powerful and successful book, which needs no word of comment or description here. The myriad readers of Mr. Howard's will be glad of the opportunity to secure a copy of this work in this cheap and available form. C. P. W.

A MEXICAN GIRL. *Frederick Thickett*. Boston: Ticknor & Co.

A story something like those of Bret Harte in *local*, dealing with the picturesque scenery and events found on the Mexican coast, but possessing a moral purpose, and written in an earnest, elegant style that far outruns the somewhat hackneyed products of the first author's pen. Mr. Thickett's descriptive writing is very good, his analysis of character excellent, and portrayal of struggling human emotions and passions most vivid and effective. C. P. W.

AULNEY TOWER. *Blanche Willis Howard*. Boston: Ticknor & Co.

Miss Howard is known as a writer who has done some very good work, and some of a rather indifferent order. Aulney Tower is a fairly good story, both from the point of view of plot and execution. It deals with the fortunes of a decaying Legitimist family on the border line between two hostile nations during the Franco-Prussian war. The motive of the story is found in the struggling emotions of love and patriotism in the heroine, who presents the type of a noble, refined, courageous womanhood. Some of the minor characters in the book are also well conceived and wrought out. C. P. W.

ESSAYS ON GOD AND MAN; OR, A Philosophical Inquiry into the Principles of Religion. *Rev. Henry Thore Bray*, M. A., B. D., LL. D. Rector of Christ Church, Boonville, Mo. St. Louis: 1888. Nixon-Jones Printing Co.

The scholarly author is a most radical rector of a Christian church; hold in his thought and accepting its consequences. He proves that God is immanent in the Universe, that the Bible, as the other bibles in the world, is, in the highest sense, but the history of the attempts of the people to express the impression made on the mind by God immanent in nature. The author does not penetrate to Monism; he remains satisfied with "some reasons in proof of the immortality of the soul" instead of solving the problem by plainly showing what is immortal and what is perishable in man. The immanent immortality of Monism has been discussed in an editorial of No. 25, of THE OPEN COURT.

The book is full of pertinent quotations from all sources. They form in themselves an interesting collection, but we must confess that they are so numerous that sometimes the author himself is entirely lost sight of.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXXII—Continued.

The actress fondled the dog in her arms.

"The rogue is very much spoilt; he creeps into my muff when I go to the theatre, and I am obliged to take him with me. I was lately frightened to death on his account; for once, while I was lamenting as Clara among the citizens, Billy had run out of the green-room and, standing between the curtains, began to wag his tail and caper about on his hind legs."

"That must have been very pathetic," said Mrs. Hummel.

"I moved about more than usual," replied the act-

ress, "and at every turn in the scene I had to call out, 'Lie down, Billy.'"

"Excellent," nodded Mr. Hummel; "always presence of mind."

"To-day I am thankful to the naughty little creature, though," continued the actress, "for he has afforded me the opportunity of making the acquaintance of my neighbors. Mr. Hummel, I believe?"

Mr. Hummel bowed awkwardly. The actress turned to the ladies with a bow, and the latter answered her greeting silently.

There was much in the lady that pleased Mr. Hummel. She was pretty, had a gay and cheerful countenance, and wore something on her bonnet with which he was personally acquainted. He therefore moved a chair towards her and said, with another bow:

"Will you not have the kindness to take a seat?"

The actress bowed in accepting it, and, turning to Laura, said:

"I rejoice to be able to approach you at last. You are no stranger to me, and you have often given me great pleasure, and I am glad to be able to-day to thank you for it."

"Where was it?" asked Laura, embarrassed.

"Where you would certainly never have thought of it," replied the other. "I have keen eyes, and over the footlights I observe the face of every spectator. You cannot imagine how painful that is to me sometimes. As you are always in the same seat, it has often been a great pleasure to me to rest my eyes on your features and observe their interested expression; and more than once, without your knowing it, I have acted for you alone."

"Ha!" thought Laura, "it is Venus." But she felt a chord had been struck which gave out a pure tone. She told the actress how unwillingly she missed any of the plays in which she acted, and that in their house the first question, when they received the new bill of the play, was whether the lady was going to act."

This gave the mother an opportunity of entering into the conversation. The actress spoke warmly of the kindness with which she had everywhere been received. "For the greatest charm of our art is the secret friends that we gain by our acting—people whom otherwise one perhaps never sees, whose names one does not know, yet who take an interest in our life. Then, if by accident one becomes acquainted with these kindly strangers, it is a rich compensation for all the sufferings of our vocation, among which the intrusive homage of common persons is perhaps the greatest."

It was clear she could not reckon the homage of the Doctor among these sufferings.

While the ladies were thus talking together, and

\* Translation copyrighted.

Mr. Hummel listened with approbation, some gentlemen approached the table. Mrs. Hummel politely greeted the second tenor, who had once sung for her at the godmother's house, and the worthy father of the stage, who knew Mr. Hummel at the club, began a conversation with him concerning the building of a new theatre. On this subject Mr. Hummel had, as a citizen, a very decided opinion, in which the worthy father quite agreed.

In this way the two parties mingled together, and the table of Mr. Hummel became a centre round which the children of Thalia thronged. While the actress was talking with Mrs. Hummel in a very creditable and domestic manner of the inconveniences of her dwelling, Laura glanced at the Doctor. He was standing some steps from the party, leaning against a tree, looking thoughtfully before him. Laura suddenly moved towards him, and began speaking rapidly: "My father has offended you. I beg your forgiveness."

The Doctor looked up. "It does not pain me," said he, kindly; "I know his way."

"I have talked to her," continued Laura, with trembling voice; "she is clever and amiable, and has an irresistible charm of manner."

"Who?" asked the Doctor; "the actress?"

"Do not attempt concealment with me," continued Laura; "that is unnecessary between us; there is no one on earth who wishes for your happiness more than I do. You need not trouble yourself about others shaking their heads; if you are sure of the love of the lady, all the rest is a secondary consideration."

The Doctor became more and more astonished. "But I do not wish to marry the lady."

"Do not deny it, Fritz Hahn; that ill becomes your truthful nature," rejoined Laura passionately; "I see how well the lady suits you. Since I have seen her, I feel convinced that she is capable of appreciating all that is good and great. Do not hesitate, but venture courageously to seek her heart. Yet I am so troubled about you, Fritz. Your feelings are warm and your judgment sound, but you cling too firmly to that which surrounds you. I tremble, therefore, lest you should make yourself unhappy by not deciding at the right moment upon a course which will appear strange to your family. I know you from my early childhood, and I am sure that your danger always has been to forget yourself for others. You might pass a self-sacrificing existence, which I cannot bear to think of. For I desire that all happiness should be your portion, as your upright heart deserves." Tears coursed down her cheeks, as she looked lovingly upon him.

Every word that she spoke sounded to the Doctor like the trilling of a lark and the chirrup of the cricket. He spoke softly to her: "I do not love the lady; I have never thought of uniting her future with mine."

Laura drew back, and a bright color suffused her face.

"It is a passing acquaintance, nothing more either for her or me; her life belongs to art, and can hardly adapt itself to quiet domestic habits. If I could venture to seek a heart for myself, it would not be hers, but that of another." He looked towards the table, from whence at that moment there came a loud laugh, evidently of Mr. Hummel, and spoke the last words so low that they scarcely reached Laura's ear, and he looked sorrowfully down on the buds of the elderbush in which the young blossoms still lay hidden.

Laura stood motionless, as if touched by the wand of a magician, but the tears still continued to flow down her cheeks. She came very near touching to her lips the cherry of her philopena legend.

Then the merry cockchafters hummed round her, the actress nodded smilingly to her, and her father called her:—the fairy tale was at an end. Laura heard the actress say triumphantly to the Doctor, "He offered me a chair, he is no growling bear after all. And he was so kind to Billy."

When Fritz returned home, he threw off his hat and overcoat, rushed to his writing-table, and took up the little letters in the unknown hand. "It is she," he cried, aloud, "fool that I was to doubt it for one moment." He read all the letters again, and nodded at each. It was his own high-minded, noble maiden who had before disguised herself, now she had shown herself to him as she really was. He waited impatiently for the hour when he should meet her at their friend's. She entered late, greeted him quietly, and was more silent and gentle than usual. When she turned to him she spoke seriously, as to a trusted friend. Her quiet composure became her well. Now she showed herself to him as she was, a refined mind full of true enthusiasm. Prudery and sportive moods had only been the shell that had concealed the sweet kernel. The unassumed caution, too, with which she concealed her feelings among her friends, delighted him. When the next ballad should come, then she would speak to him as she felt, or she would give him permission to write openly to her. The next morning the Doctor counted the minutes till the arrival of the postman. He tore open the door and hastened to meet the man. Fritz received a letter, he broke the cover impatiently, there was not a line from his correspondent; he unfolded the old printed sheet, and read the words of a coarse bacchanalian ditty:

"On the spit with ox and pig,  
Clear the green for reel and jig,  
Wine and rhyme and wassail-shout,  
Pass the flowing bowl about!"

So the honest, simple-minded Doctor asked again: Is it she? or is it possible that it is not?

(To be continued.)

## NOTES.

The *Revue Philosophique* for September contains an essay by A. Binet on Moral Responsibility.

The best text book for English readers to study Kant is, to our knowledge, Prof. John Watson's recently published work, *The Philosophy of Kant, as Contained in Extracts from his own Writings*. New York: 1888. MacMillan & Co. The book will soon be reviewed in our columns.

Prof. Thom. H. Jappe, of Davenport, in No. 16 of *The Lehrer Post*, Milwaukee, urges that the instruction of German should be obligatory in all schools, not for the reason that there are so many Germans in this country but because it is the most important language to an English speaking race. In all higher schools, Mr. Jappe says, Latin and German should be obligatory.

"*Wit and Humor: Their Use and Abuse*," by Wm. Matthews, LL. D., is announced for immediate publication by S. C. Griggs & Co., Chicago. Prof. Matthews is one of the most widely read of modern authors. His "Getting on in the World" has had an enormous sale. His books are always strongly characteristic, and few writers have a happier faculty of combining entertainment and instruction.

Suggestibility is by no means peculiar to hypnotized persons. Almost every one is sensitive to suggestion to a certain extent when awake, for in every human being, no matter how skeptical he may consider himself, there exists a certain degree of credulity, and this credulity may be played upon and taken advantage of in a measure. Children can be made to believe the most preposterous statements if they are made with sufficient gravity.—[From "Hypnotism: What it is and what it is not," by Dr. CHRISTIAN A. HETTER, in the *Popular Science Monthly* for October.]

A powerful agitation has been started in Germany for modernizing the school system. Prof. W. Preyer has taken a prominent part in the discussion of this subject by publishing a pamphlet "*Naturforschung und Schule*," which denounces the errors of the old scholastic methods and proposes a new plan which will conform to the requirements of science. Prof. Preyer in a private letter informs us that "Dr. Hugo Göring, a man of extraordinary energy intends to found a school on the principles of Biology in Berka on the Werra." Prof. Preyer adds, and we believe he is right, that "America would be a better field for such a school than Germany." We therefore call the attention of those interested in the progress of educational institutions to this new movement in Germany.

## FORMER CONTRIBUTIONS TO "THE OPEN COURT."

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. Katzenjammer is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to Katzenjammer. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer's-band was that of Cataline! What Katzenjammer was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igdrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

WILLIAM J. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfism is means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."

GEN. M. N. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

EWALD HERING.

Nos. 22 and 23 contain a very eloquent article on "The Specific Energies of the Nervous System," by Dr. Ewald Hering, Professor of Physiology at the University of Prague. His useful additions to physiological science are enumerated in the *Encyclopedia Britannica*, under the heading of "Physiology." Several pages of the *Encyclopedia* are devoted to Dr. Hering. His discoveries make an era in physiological study, and we remind our readers of his learned and instructive essay on "Memory," published in Nos. 6 and 7 of THE OPEN COURT.

Dr. Hering's article on the "Specific Energies of the Nervous System," while profound in argument and full of information in its details, is at the same time so simple in statement and so easily understood that the reading of it is a pleasure as well as a study. Such articles enable us to see farther into Nature than we formerly did, and they reveal to us that her "specific" work is much of it so delicate and fine that the most powerful microscope cannot make it visible to the material eye of man. Throughout the essay the following proposition is maintained: "The germs of each animal species possess an inherent and innate faculty, viz: a specific energy which directs its development in a manner characteristic to this animal and no other. Again, each single germ possesses an individual energy which, in addition to the normal features of its species, secures an individual character to its future development."

## LONDON EXCHEQUER JET BLACK INK.

This Ink has now been in use for almost  
 TWELVE YEARS, and the demand is  
 constantly increasing. It is without doubt  
 the VERY BEST JET BLACK ink. We  
 submit the following facts.

1—IT WRITES JET BLACK instantly,  
 neonously, and you need not wait until the  
 Ink dries to turn black as is the case in  
 most Inks.

2—It flows freely and never corrodes.  
 3—It never freezes.  
 4—We make it in four sizes:—2-oz. bot-  
 tles, 15 cts.; half pint bottles, 30 cts.; Pint  
 bottles, 50 cts., and Quart bottles, \$1.00.

All sizes can be sent to any address.  
 If your Stationer or Bookseller does not  
 keep it in stock, write direct to us.

The trade supplied on liberal terms.

BRENTANO'S,

5 Union Square, New York.

101 State Street, Chicago.  
 17 Avenue de l'Opera, Paris.

## Recent Contributions to 'The Open Court.'

DRUMMOND'S NATURAL LAW IN THE  
 SPIRITUAL WORLD.

JAMES HERBIN.....In No. 56.

An instructive criticism of a book "that has cre-  
 ated a sensation in certain orthodox circles, and  
 which, when superficially considered, has the ap-  
 pearance of substantiating certain Christian dog-  
 mas by scientific analogies." Mr. Herbin points  
 out the inconsistencies resulting from the further  
 development of Drummond's doctrines and men-  
 tions several natural principles which were not ad-  
 mitted into the analogy.

REMINISCENCES OF MR. ALCOTT'S CON-  
 VERSIONS.

MRS. EDNAH D. CHENEY.....In Nos. 49 and 50.

In Nos. 49 and 50 THE OPEN COURT publishes a  
 paper upon Mr. Alcott's conversations, read by Mrs.  
 Ednah D. Cheney before the Memorial Meeting of  
 the Concord School of Philosophy. Mrs. Cheney's  
 recollections of Mr. Alcott lead us back as far as  
 the year 1840. The reminiscences cover almost a  
 half a century of Mr. Alcott's intellectual life.  
 Abstracts are given of his conversations, incidents  
 described in which noted contemporaries figured,  
 and anecdotes told illustrative of Mr. Alcott's life  
 and thought.

Wheelbarrow, in No. 52, contributes an addi-  
 tional reminiscence of this "amiable philosopher  
 and venerable man."

ETHICS AND PUBLIC LIFE.

W. M. SALTER.....In No. 45.

The well-known lecturer of the Society for Ethical  
 Culture in Chicago bravely probes the wounds of  
 our public life and shows his patriotism by boldly  
 denouncing the evils and wrongs of American poli-  
 tics. But he is no pessimist; he does not despair of  
 improvement and progress. He knows very well  
 that men "of Roman virtue" still exist. Mr. Salter  
 wants to elevate our conception of politics, so that  
 the best men in the community would lose their re-  
 spondence to public life; that they would enter it  
 once more to make it great and illustrious.

THE FIELD-INGERSOLL CONTROVERSY

An editorial discussion of the Field-Ingersoll  
 Controversy and of Mr. Gladstone's Remarks upon  
 the same, will be found in Nos. 43 and 44. The  
 questions and issues involved are treated from an  
 independent and impartial standpoint. The inef-  
 ficacy of Agnosticism to approach a solution of the  
 religious problem is shown; Agnosticism being but  
 a negative view of the world. The true position  
 and significance of both parties in the development  
 of the religious idea are pointed out and each is re-  
 cognized as important and necessary to the ultimate  
 synthesis of religious truth, a religion which will in  
 clude what is good in all.

THE FUNDAMENTAL PROPERTIES OF  
 MATTER.

J. G. VOGT.....In Nos. 29, 31, and 34.

To the kinetic conception of the world's mecha-  
 nism Vogt opposes his hypothesis of a continuous  
 world-substance completely filling space and whose  
 sole manifestation of power consists in contraction  
 or condensation. He claims that the kinetic or me-  
 chanical theory, which explains organized and spiri-  
 tual phenomena from inelastic atoms and a pur-  
 poseless force, is untenable; and that pseudo-mo-  
 nism, which transforms the most complex conditions  
 and processes of psychical life into the elementary  
 substance itself, involves the fallacy of idealism  
 and dualism. As opposed to both views Vogt pro-  
 pounds his conception, which he calls Monism of  
 Reality. He attributes to matter two fundamental  
 properties, motion and sensibility, and deduces  
 from these elementary properties the higher phe-  
 nomena of intellectual life.

ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37, 40, and 47.

The Economic Conferences of Chicago may be  
 hailed as a significant indication of a breach in the  
 barrier between Labor and Capital. The confer-  
 ences have served as a medium for the open ex-  
 change of opinion, where both sides are fairly rep-  
 resented. Wheelbarrow's criticisms are acute and  
 pithy, and merit a careful perusal. The author  
 unites Old Saxon simplicity, sincerity of heart, the  
 truthfulness of honesty and warm sympathy for  
 justice and right.

WHAT MIND IS.

PROF. E. D. COPE.....In No. 40.

THE NATURE OF MIND.

BY THE EDITOR OF THE OPEN COURT, No. 40.

Professor Cope gives in clear and comprehensive  
 outlines his view of mind; he opposes Materialism  
 and Dualism, stating that "the situation is mono-  
 nistic." However, "as the amount of thought can  
 most assuredly be measured, but the quality of  
 thought can not," the eminent American scientist  
 concludes that "consciousness has a field of its own  
 where it ranges free from the bonds of energy." The  
 directive element (will and mind) is qualitative  
 not quantitative and controls the movements of the  
 non-mental environment. "This statement may be  
 called occultism," Prof. Cope adds, "and I sup-  
 pose justly. But such is the fact."

In opposition to Prof. Cope, the Editor explains  
 his view of mind. The qualitative faculties are a  
 matter of form. Form is the essential character-  
 istic of mind, and a superior mind indicates a su-  
 perior form of brain structure. Form is an abstrac-  
 tion from reality and has by itself no efficacy.  
 Mr. Ribot, the founder of the French school of ex-  
 perimental psychology, is quoted in support of the  
 fact that consciousness by itself is not an effective  
 factor in the motion of our limbs. "The conscious-  
 ness of mental states may be indispensable for a  
 proper direction of our will, but it does not possess  
 motive power. Prof. Cope's view is considered in-  
 consistent because leading to dualistic statements  
 and to occultism."

A letter from Prof. E. D. Cope, which has re-  
 ference to this discussion, is published in No. 42.

PLANTATION FOLK-LORE.

L. J. VANCE.....In Nos. 41, 45, and 46.

Mr. Vance reviews and discusses the movement  
 and widespread interest in popular tales which has  
 produced the recent collections of Negro Myths  
 by Joel Chandler Harris ("Uncle Remus") and  
 Mr. Charles C. Jones. These tales form an im-  
 portant addition to the Folk-Lore of the New World,  
 and Mr. Vance's review will be welcomed by all  
 who wish to acquire a comprehensive estimate of  
 the significance of these Myths to comparative lit-  
 erature and the science of comparative ethnology.

THE ANIMAL SOUL AND THE HUMAN  
 SOUL.

CARUS STERNHEIM.....In Nos. 37, 41, and 45.

An essay full of fine thought and psychological  
 depth. Carus Sternheim understands to follow a  
 subject as historically developed in the realm of  
 human opinion and as ultimately affected by the  
 light of Modern Science. The question of the re-  
 lation of the animal to the human soul has ever  
 been of interest and in this essay we find it attrac-  
 tively yet accurately treated.

DETERMINISM VERSUS INDETERMINISM.

PROF. GEORGE VON GIZYCKI.....In Nos. 25 and 26.

Georg von Gizycki is Professor of Philosophy at  
 the University of Berlin. His name is well known  
 beyond the boundary of his country. The problem  
 of the Freedom of the Will has perhaps never been  
 treated in a clearer and more forcible manner. Con-  
 tributions on the same subject have been published  
 from E. P. Powell and Xenos Clark.

# The Open Court.

A WEEKLY JOURNAL

Devoted to the Work of Conciliating Religion with Science.

Entered at the Chicago Post-Office as Second-Class Matter.

OFFICE, 169-175 LA SALLE STREET.

No. 58. Vol. II.—32.

CHICAGO, OCTOBER 4, 1888.

### WANTED!

An energetic and educated person wanted in every town, city and district, to canvass for subscriptions to *THE OPEN COURT*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,  
Box F., Chicago, Illinois.

### A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

CHAS. W. SMILEY, Publisher,  
Box 630, WASHINGTON, D. C.

Mr. GEO. WILLIS COOKER will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. COOKER's address is DENHAM, MASS.

### SHELLS, MINERALS & FOSSILS

—Also—

### SEEDS and PLANTS.

C. R. ORCUTT, Publisher,  
The West American Scientist,  
SAN DIEGO, CALIFORNIA.

### Three Introductory Lectures

—on—

## The Science of Thought.

(First published in *THE OPEN COURT* of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

"Full of novel thought."—*Chicago Herald*.  
"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The absurdity of the theory is manifest."—*New York Science*.

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

### THE LEADING ORGAN

of British Thought on the American Continent

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$5.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its columns. For rates, etc., apply to

TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

**Monism** is that view which recognizes the Oneness of All-Existence

As a Philosophy, *Montanism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social, and economic questions.

#### RATES OF ADVERTISING.

For Each Insertion, without choice of position, per line.....	\$ .10
" " " " " " per column.....	12.00
" " " " " " per page.....	20.00

Agate measure, 14 lines to the inch, 126 lines to the column.

For specified position, 20 per cent. will be added to regular rates.

THE OPEN COURT sent free to advertisers while their advertisements continue.

TO ADVERTISERS.—The OPEN COURT will be found to offer especial advantages for the advertisement of Current Literature and the insertion of Publishers' notices. Its numbers being on file in all the prominent hotels, libraries and public institutions in the United States and Canada, and reaching the professional and scientific circles of every State in the Union. Only bona fide advertisements will be accepted.

THE OPEN COURT.

(Nixon Building, 175 La Salle Street.)

P. O. DRAWER F.

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the

idealist to deny the existence of matter. The materialist beholding the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. Katzenjammer is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal, even Socrates, with all his virtues was somewhat addicted to Katzenjammer. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer's-band was that of Cataline! What Katzenjammer was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

WILLIAM L. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishness means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

GEN. M. M. TRUMBULL.

In No. 25 Gen. Trumbull has an article on "The Value of Doubt in the Study of History." He shows the tendency of historic writing toward exaggeration and falsehood; and he advises teachers to strengthen the minds of pupils by the exercise of doubt. Much of the history of the late war as written by our famous generals is as fabulous as the legend of Romulus and Remus. It is written by men interested in their own story, and therefore it comes under the suspicion cast upon it by the ordinary rules of evidence. "This war history," says Gen. Trumbull, "is woven out of camp-fire yarns." "Like the feet of Chinese children," he says, "our minds were crippled in infancy, and many of them have been lame ever since. They are not as useful to us as they would have been if strengthened in infancy by the exercise of doubt."

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express — to suck."

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.

BY A. BINET.

Translated from the "*Revue Philosophique*" by uspc.\*

PART VII.

VI.

It is difficult in the extreme to mark out the lines of a psychology of Proto-organisms from data so incomplete as those we have just collected. We shall content ourselves with a few brief considerations.

The apparent result of our investigations up to this point is, that the greater number of movements and actions observed in Micro-organisms are *direct* responses to excitations emanating from the medium in which they live. It is the condition of the medium that, to all appearance, rigidly determines the character and manner of their activity; in a word, they exhibit no marks of pre-adaptation.

But it will not do to let the matter rest with this general survey of the subject; we shall have to examine more closely each detail of these reflex actions of adaptation, beginning with the sensory phase and ending with the motory phase. Analysis discloses that several determining elements may be distinguished in these phenomena; they are:

1. The perception of the external object;
2. The choice made between a number of objects;
3. The perception of their position in space;
4. Movements calculated, either to approach the body and seize it, or to flee from it.

We are not in a position to determine whether these various acts are accompanied by consciousness or whether they follow as simple physiological processes. This question we are obliged, for the present, to forego.

1. *The perception of an external body.* Among the lowest forms, it appears that perception is always the result of a direct irritation produced by contact of the external body with the protoplasm of the animalcule. This is what takes place, to all appearance, among the *Amœbæ*; for these organisms, the condition necessary to the perception of a solid particle is contact with it. A step forward has been effected in those organisms that are able to perceive external objects by contact from a distance, as is observed for instance in the *Actinophrys*, which perceives all bodies that chance to touch its long filamentous pseudopods; yet, in this in-

stance, the pseudopod merely acts the part of an extended tactile organ. The vibratile cilia, and still more the long lash of the Mastigophores, enable the animal to discern the presence of contiguous particles at a certain distance from its body, by the pressure exerted upon their appendages. It is not known whether there are many animalcula that perceive the presence of nutriment from a distance and without coming in direct contact with it; it appears, however, that this is the case with the *Didinium* which shatters its prey from a distance and without touching it.

2. *Choice.* We have seen that Micro-organisms do not absorb indiscriminately every solid particle they meet. They exercise a choice. Among the lower species, the choice is in the lowest degree rudimentary; the organism restricts itself to a discrimination of mineral particles, sand for example, from organic substances; it rejects the former and absorbs the latter. Among the higher animalcula the choice is more intelligent. There are Infusoria that feed only upon plants and animals. There are also those which feed exclusively upon one species.

This exercise of choice is one of the most incomprehensible of phenomena; it is exceedingly difficult to explain it without resort to anthropomorphism. If we hold to what observation directly teaches us, the choice may be said to consist in the following acts: when the animalcule perceives certain kinds of substances and particularly those substances which serve it as customary food, it invariably goes through the same movement, which consists of an act of prehension; when the substance touched, seen, or collided with, as the case may be, is of another kind, the Micro-organism does not go through this act. Such is the phenomenon; as to the explanation of the same, we are unable to give one.

According to M. E. Maupas, if certain Infusoria feed exclusively upon a certain species, it is because their buccal apparatus, or organ of prehension, makes it impossible for them to feed upon different species which possess different tegumentary envelopes. The question is to ascertain whether this explanation is applicable only in certain cases, as appears very probable to us, or whether, on the other hand, it is of complete and universal applicability. We confess that the hypothesis of M. Maupas does not explain to us

\* Translation copyrighted.

why a hunter Infusory that throws trichocysts, like the *Didinium*, attacks the *Paramecium aurelia* and not the *Paramecium bursaria*.

It is possible that certain species attract the organisms which feed upon them, by means of a physical or chemical excitation.

The researches of Prof. Pfeffer, of the, Tübingen Botanical Institute, lend a certain confirmation to this hypothesis.\*

3. *Calculation of the position occupied by the external body.* It is a universal fact that Micro-organisms not only perceive external bodies, but that they also indicate, by their movements, an exact knowledge of the position occupied by these bodies. It might be said that they invariably possess a sense of position in space. The possession of this sense is absolutely indispensable to them, for it does not suffice them to know of the presence of an exterior body in order to approach it and seize it; they must furthermore know its position, so as to direct their movements accordingly.

The simplest form of a sense of localization is met with in the *Amœba*, which, when it closes about a nutritive particle, always emits its pseudopods at precisely that part of its body where the foreign substance caused the irritation. The most complicated instance of localization is met with in the *Didinium*, which we have so often cited; the *Didinium* knows precisely the position of the prey it follows, for it takes aim at the object of its pursuit like a marksman, and transpierces it with its nettle-like darts. Between these two species, we find all the intermediate instances of a localization of perceptions.

However, doubts exist upon the question as to whether Proto-organisms know the direction and distance of external bodies, or whether they only succeed in getting at them after a series of tentative movements. The observations which we have collated do not solve the question.

4. *Motory phase.*—We now pass to the motory phase. The movements made by Micro-organisms as if in response to an excitation, are not in most instances simple reflex motions; they are movements adapted to an end. We cannot repeat it too much: these movements are not explained by the simple phenomenon of cellular irritability.

In the very first instance, they vary according to the excitation; a given excitation produces a corresponding motory response; a body situated at the right does not bring about the same movement that a body situated at the left does; a particle of the nutritive sort does not provoke the same course of action that

a particle of a different sort does. All this implies that associations have been established in the protoplasm between certain excitations and certain movements. The explanation of the physical nature of these association appears to us totally impossible.

The quite ingenious ideas broached by Spencer upon the lines of least resistance offered by the commissural fibres cannot be applied here, since everything takes place in a single cell. What would be necessary to explain is how and in consequence of what mechanism of structure one form of molecular movement, corresponding to a given excitation, is followed by a certain other form of molecular movement corresponding to an act likewise determined.

REMARK.—The weekly publication of M. Binet's articles closes with this number. The concluding parts, as published in full in the *Revue Philosophique*, will appear with those already given to the public in pamphlet form during the present month. The whole will include the important and interesting subdivisions on "Fecondation" and the "Physiological Function of the Nucleus."

### WHEN IS HOMICIDE JUSTIFIABLE?

BY CHARLES K. WHIFFLE.

The hanging of the Anarchists in Chicago has brought up anew before the community the question of capital punishment; first, as to its rightfulness, next, as to its expediency. Of course, this, like all other questions, must continually come up for reconsideration until it is settled in the right way; and until such settlement is obtained, we must compare different opinions, with the reasons for them. I, therefore, will give my opinion; quoting one case of actual occurrence in which the deliberate taking of human life seems to me right and expedient, and another which appears to me unjustifiable, and also specially injudicious.

It is admitted that the people called "Border Ruffians" in Kansas, in 1856, were brutal and violent men, sent by Missouri slaveholders into Kansas, first to drive away or kill the Abolitionists there, then by illegal votes and the use of armed force against the legitimate voters to establish a nominal government, proslavery in character and ready to assist their outrages, and finally to make Kansas a Slave State. It is admitted that they did commit many murders and other acts of violence, that by giving illegal votes, and by killing or violently driving away legitimate voters, they did succeed in forming a pretended State government which upheld and assisted their lawless proceedings, and that they openly declared their determination to persist in that course. And it is further admitted that the United States' government, Franklin Pierce of New Hampshire being President, favored and actively aided the policy above described.

The people of Kansas and the immigrants there from New England were peaceful, law-abiding men, who had long borne outrages from the emissaries of

\*Lac of space prevents us from developing this hypothesis more at length. I shall recur to the question later on, when the present articles are in final form.

slavery with patience, and who, when driven to take arms in self-defence, were outnumbered by brutal and desperate men. What next were they to do? There was neither Town, nor State, nor National Government to appeal to. All the authorities supported the slaveholders and their policy.

It is also admitted that the Border Ruffians, being undoubted and atrocious criminals, would have suffered capital punishment under the laws of any of the Free States. Their proceedings were not only illegal and immoral, but also cruel and brutal. Yet they declared their determination to continue them until Kansas was made a Slave State; and all the authorities of State and Nation were on their side. What was to be done?

The Free State men saw that it was useless to fight against superior and increasing numbers, with the prospect not only of massacre for themselves and their families, but of inevitable triumph for the slave power. They could not bear the thought of fleeing from the State; and thus sacrificing both their property and their cause, the cause of freedom in Kansas. What was to be done?

The course of justice in any of the Free States would have been to seize and imprison those murderers, bring them to court for trial, and hang such of them as were proved guilty. But in Kansas neither court nor prison was within reach of the opposers of slavery. The law-abiding Free State men were at their wit's end. No refuge seemed left, either for themselves or their cause. Justice, in her ordinary form of law, sheriff, court, and prison, was not there. But, most fortunately, justice in the shape of opposers of slavery *was* there; and some of those men promptly did what justice manifestly demanded, and what her ordinary forms would have done more slowly had they been accessible.

In May, 1856, the leaders of the Free State men obtained sure information that certain of the Border Ruffians, residing on Pottawatomie creek, near which John Brown lived, had lately been in Missouri, and had succeeded in raising forces to expel or murder the Browns and other prominent opposers of slavery. These leaders then held a consultation and determined that on the first indication of attack by the persons in question, namely, the Doyles, Wilkinson, and Sherman, they should be seized and summarily put to death.

On the 24th of May, four days after the sacking of Lawrence, a brutal assault was committed on an abolitionist at the store of Sherman, in which the Doyles participated. These wretches on the same day called at the houses of the Browns, and both by word and act offered the grossest indignities to the women there, saying, as they left: "Tell your men that if they don't

leave right off, we'll come back to-morrow and kill them." Some of the Free State men, being thus forewarned, on the night of May 24th seized and put to death the persons above named, thus giving check to the process of pro-slavery outrage by removing its leaders.

This seizure and execution were charged upon John Brown. In a Memoir of John Brown carefully compiled from all available sources, Dr. Richard D. Webb, the author, said:

"Brown was at Middle Creek that night, twenty-five miles away, and did not know what had occurred till next day; nor were any of his sons present. When accused of personal participation in the deed, he flatly denied the charge. But, remember, added he, I don't say this to exculpate myself; for, although I took no hand in it, I would have advised it had I known the circumstances; and I endorsed it as it was."

Moreover, Mr. Richard J. Hinton, a thoroughly competent and trustworthy witness, having made careful inquiry on the spot at the time and afterward, denied this charge in a letter of Dec. 23, 1859, to the *Boston Traveller*, of which paper he had been the regular Kansas correspondent. In that letter, after giving historical details, he said: "John Brown told me he was not a participant in the Pottawatomie homicides. John Brown was incapable of uttering a falsehood."

Certainly, John Brown had the courage of his convictions. His assertion must settle the point with all who knew him. Nevertheless, he approved these executions. The question now is, Are we to approve them?

From the state of things above rehearsed, namely, that the men were grossly guilty, deserving, for many reasons, the severest punishment, and determined to persist in their crimes—that the peace and welfare of the community required their removal—and that there was neither a regular court to try them nor a prison to restrain them from further outrage, I think that the killing of those malefactors was both right and wise, and that their executioners merit praise instead of censure.

Let us now look at another case.

The Anarchists who have lately been put to death in Chicago by sentence of the Supreme Courts of Illinois and the United States, were proved to be gross violators of law, and also thoroughly hostile and dangerous to the peace and welfare of the community. Did these facts justify the deliberate taking of their lives, as in the case of the Border Ruffians of Illinois?

I think there is this essential difference between the two cases: The civil authorities had the Anarchists entirely in their power, and imprisonment of them for

life would have given the needful protection to the community much better than execution of the death penalty, since new attempts at revenge by retaliation may be expected from their relatives or accomplices. The justification of those who slew the Border Ruffians was, that the outrages against life and liberty in Kansas could be checked only by the method there taken. In the state of things then and there existing, protection to the community could not be given in any other way. This fact, I think, authorized the killing of the Border Ruffians, while no such state of things authorized the killing of the Anarchists. Their execution was wrong, because the better method of long and secure imprisonment was fully within the power of the court; and it was inexpedient in the highest degree, since it has elevated the sufferers to the rank of martyrs in the eyes of numerous associates, from whom acts of retaliation may be expected, continuing indefinitely to disturb the peace of the community. Taking their lives under such circumstances was not only a fault but a blunder.

#### THE UNCERTAINTY OF THE LAW—ITS REMEDY.

BY CHARLES T. PALMER.

"Brethren of the legal profession, we cherish a noble ambition, if, above all mere personal views and desires, we aim to make the world better and our country greater and nobler for our having lived in it. The aim will be in a large degree accomplished if our labors shall tend to simplify and elevate the law. Without good and trustworthy laws there can be no great and noble State, no settled order, no happy people. And far beyond all other influences, the labors of the legal profession are capable of lifting the State to that enviable condition of a State whose laws give content to the people, because they are just, and because the people know, and understand, and approve, and therefore abide by them."

Such are the significant words with which Hon. Thomas M. Cooley closes an address entitled, "The Uncertainty of the Law," delivered at the last meeting of the Georgia Bar Association, wherein he takes the position that the charge that the law is uncertain, on the lips of the vast majority of people throughout the United States, is unjust and unfounded; and brings to his support the oft repeated truism that above and beyond the Court, the mere instrument by which the law is declared and applied to human affairs, there is a grand body of legal principles, omnipresent and co-existent with eternity, founded in and consonant with reason and natural equity, immutable and unaffected by the changing circumstances of the race, out of which all human rights proceed and by which they are determined.

This as an abstract proposition need not be dis-

puted, but it is, nevertheless, true that the exact nature of the law can never be ascertained, and, in fact, has no substantive existence until a court has passed upon and recognized the given principle. So long as the probable action of the Court is shrouded in mystery, just so long can it be said that the law is uncertain. The Courts, the legal profession, the eminent authority, Mr. Cooley himself, all combine to rivet the charge of uncertainty upon the law by admitting the uncertainty of its administration; by admitting the hopeless complications of its precedents and practice; and by suggesting that it is the highest duty of the legal profession to take such action as will tend to *simplify and elevate the law*.

To this end many methods have been suggested, all containing some elements of virtue, none reaching the evils complained of. Codification has been invoked; uniformity of judicial decision in the several States of the United States has been advocated; committees and bar associations have been recently formed, all for the purpose of bringing about greater certainty in the law. Such eminent authority as Joel Prentiss Bishop is found advocating the preservation of the old common law system of jurisprudence as the only means of arriving at certainty, while David Dudley Field, and others of like standing, point to codification as the only refuge from hopeless confusion.

"*Stare Decisis*," at one time the cherished motto of Courts, under the unconscious influence of a new dispensation has degenerated into a rule to be applied only in cases where positive injustice is not done to the individual litigant. Judges are everywhere adopting the practice of the early Chancellors of England, the practice which obtained before Equity became a distinctive branch of our jurisprudence, namely, of deciding each particular case according to principles of natural equity and right as applied to the facts. Five centuries of endeavor on the part of the Courts to give stability to rules of law by following precedent, all will agree has resulted in inextricable confusion, until it is not too much to say that precedent and authority can be found for almost any cunningly devised proposition of law which the ingenuity of man can suggest.

In every community there is some worthy person who from childhood to old age has been dealing with his fellows, and been brought into contact with men of all sorts, and who all the time has been living in obedient conformity to law, but ask him what the law is and he cannot tell you; he has never heard it defined, he has never been told its rules. In his dealings with his neighbors he has not thought of law, but has only meant to do what is right; tested by the great principles of law, his action will be found to conform to law. This illustration, used by Mr. Cooley to ex-

emply a widely different proposition, suggests the secret by which the stability of our jurisprudence may be established and the certainty of the law maintained.

There is that innate quality in human nature which enables the mind to discern the right however its standards may vary in different times and civilizations, and Courts, being the instruments of humanity, should be held to a strict accountability to decide all cases in accordance with those eternal principles which are above and beyond the technical administration of the law. There need be no fear as to inconsistency, that which is right is always consistent with itself. The life, the effort, and the work of great and good men in the world's history is strangely consistent with itself, though at the time they wrought their heroic deeds they took no thought of their actions in the past or their conduct in the future. The speeches of great men on all questions of moral reform are strangely consistent with each other, although delivered at long intervals of time, and under widely different circumstances. The law is greater than any individual, strong enough and broad enough to take care of its own consistency. Its application to human affairs can never be made certain until the Courts that apply it are animated and controlled by principles as broad and strong as those of the law itself; in other words, the only salvation for our jurisprudence is the adoption, in its broadest, fullest significance, not using the term in a technical or confined sense, of an Equity Jurisprudence whereby the Court "Considereth all the circumstances of the deed" and judgeth accordingly. Nor in so doing will Courts be traversing an untraveled field, for it was this thought and purpose that prompted the Chancellors of England to break away from the narrow and inadequate system of common law procedure, and to create new forms of action for the redress of grievances, and the recognition of new and substantive rights. The same spirit should animate the Courts of to-day to the end that the administration of law may keep pace with the onward march of civilization, and precedent and authority become in name what they are in fact, the landmarks by which to determine what the law *was*, and not necessarily what it should be. Surely if, in the every day walks of life, a man not knowing the law may instinctively abide by it, Courts, in the fullness of knowledge, will find a way to maintain its integrity.

#### ON THE LIFE AND LETTERS OF CHARLES DARWIN.

BY THE REV. H. H. HIGGINS.

(Concluded.)

The writer's recollections and printed papers enable him distinctly to recall the chief features of the Darwinian controversy from the year 1855, the date of his own first communication to this Society.

Not long after this, the Mechanicalists singled out for concen-

trated attack, the argument from design, or, as it is called, teleology.

The writer has all along felt that, although unable to support teleology on orthodox grounds, if design as the source of order in nature were lost, all that is most worth caring for in natural science would be lost along with it.

In some quarters the attack on teleology is as exterminating and as bitter as ever. It must be a source of great satisfaction to many that in such quarters Professor Huxley is not to be found.

I do not profess to be able, by quoting a few lines from Professor Huxley's pen, to do justice to his views on so great a subject; but the following words from Vol. II, p. 201, are a portion of Professor Huxley's quotation of his own words, written nearly twenty years ago:—

"The doctrine of evolution is the most formidable opponent of all the commoner and coarser forms of teleology. But perhaps the most remarkable service to the philosophy of biology rendered by Mr. Darwin, is the reconciliation of teleology and morphology, and the explanation of the facts of both which his views offer.

"The teleology which supposes that the eye, such as we see it in man or one of the higher vertebrates, was made with the precise structure it exhibits for the purpose of enabling the animal which possesses it to see, has undoubtedly received its death blow.

"Nevertheless, it is necessary to remember that there is a wider teleology, which is not touched by the doctrine of evolution, but is actually based upon the fundamental proposition of evolution."

The value of these remarks is much increased by the date at which they were first written—in the very heyday of the controversy.

For teleology, to have any *raison d'être* at all, must imply a primordial source of order, and the warmest advocates of the argument from design—without assuming that Professor Huxley's views coincide fully with their own—could desire nothing better than the rejection of a teleology that is coarsely circumscribed and false, in favor of a wider teleology that is well-founded and consistent with the facts of nature.

VOL. III. The correspondence in this volume is arranged in sections, relating to the works from time to time published by the distinguished author, subsequently to 1863.

From that date, scientific men in all parts of the world anticipated a new work from the pen of Mr. Darwin with something of the keen interest which, as I well remember, was associated with the appearance of a fresh novel in the Waverley series.

In many letters Mr. Darwin refers to Pangenesis, his theory respecting the reconstruction of lost limbs in certain animals, *e. g.*, the claw of a crab or a lobster; but in no case does he seem to be convinced by his opponents' arguments, founded, as they mainly were, upon the difficulty attending the conception of an hypothesis so extremely intricate and complicated.

It is, however, a very unsafe argument against a theory, that it is too wonderful to be true. No one has illustrated this fact more forcibly than Mr. Darwin. Let us suppose a philosopher of the last century asking for an explanation of the flower of an orchid, and finding some one capable of leading him *seriatim* through all the marvels of its phylogeny and development, and natural selection, and cross fertilization, every stage in which is essential to the full elucidation of the morphology of the flower.

Is it not probable that the philosopher, let his receptivity have been ever so well developed, would be unable to accept the true hypothesis? He would be wholly overwhelmed by the marvels crowding in upon him, and his only answer would be—"it is too wonderful to be true."

So far from having reduced the mystery of life, Darwin has filled the whole kingdom of life with wonders.

Some subjects appear to have fascinated Darwin more than others, perhaps none more so than that of insectivorous plants, Vol. III, p. 320:—

"I will not publish on *Drosophila* till next year, for I am frightened and astounded at my results. I declare it is a certain fact that one organ is so sensitive to touch, that a weight seventy-eight times less than that, viz., 1-1000 of a grain, which will move the best chemical balance, suffices to cause a conspicuous movement. Is it not curious that a plant should be far more sensitive to the touch than any nerve in the human body?"

Three years before his death, Mr. Darwin added to his *Autobiography* the following lines in his own hand:—

"As for myself, I believe that I have acted rightly in steadily following and devoting my life to science. I feel no remorse from having committed any great sin, but have often and often regretted that I have not done more direct good to my fellow creatures."

Mr. Darwin died April 19, 1882.

Within the few years which have elapsed since the most honored of our sacred shrines received the remains of the author of *The Origin of Species*, a change has been hastening on which must, sooner or later, deeply affect the sanctions of religious life in every nation under heaven.

The historian who, a hundred years hence, shall write of the present movement may probably see more clearly than we do ourselves a coincidence of various proximate sources. Colenso, Max Müller, Matthew Arnold, and Darwin, each has his share, whilst thousands of the very wisest and best of men, profoundly convinced that mere science cannot of itself constitute a religion of the heart, are filled with love and veneration for the old paths, and are grateful for the results that from age to age have arisen from the ancient faiths. Such men follow with redoubled zeal the courses in which they have been brought up, yet not without a deep sense of disquietude.

This is a generation of unsparing religious efforts in many directions. Can it be true that every way seems to be zealously tried, except one? viz., a competent investigation into what it is, concerning faith and hope, that a perfectly united nature really teaches.

That enquiry is left to be answered in accordance with the tenets of an age when "Unity in Nature" was not known, or even thought of.

A time will be when, perhaps, the younger of us may see more fully than any of us do now the fitness of Darwin's testamentary summing up of his life:—

"As for myself, I believe that I have acted rightly in steadily following and devoting my life to science."

[THE OPEN COURT is devoted to the work of investigating "into what it is concerning faith and hope that a perfectly united nature really teaches." And the result of our work has been (to use Rev. Mr. Higgins's own words, p. 1232) "that Christians and heathen, bishops and philosophers, will be all sailing on the same bottom; and, to carry on the metaphor, that the most valuable and reliable seamen are not those who are the loudest renouncers of all treatises on navigation, but such as do their utmost to make whatever is good and true in the old, work in with the new."—Ed.]

## HOW FAR DOES SCIENCE GIVE US CAUSES?

BY WILLIAM M. SALTER.

A new point of view is always welcome to the genuine student of philosophy. One may not be able to wholly adopt it, but one's mental experience is almost sure to be enriched by assuming it for the time and trying to see what new light it may shed on perplexing problems. I myself, if I may be excused for making this article autobiographical, have no philosophical system. I have perhaps, a few scattered philosophical ideas, but I have spent too much time in unlearning an old view of the world to have had leisure thus far to develop a satisfying and consistent new view. And so I count myself still a student and a learner, and am desirous of enriching my storehouse of ideas with as many points of view as possible.

One of the most difficult problems I have encountered in my thinking is as to the nature of causation. What is causation? I

have asked myself, and to what extent can we find the causes of events in the world of our experience? Accordingly, I have read the article on "The Problem of Causality" by the editor of this journal in a recent number (Sept. 13), with interest and pleasure. I admire the calm and reasonable spirit manifested in it; also the simplicity of the style and the orderly development of the ideas. I find myself asking, Can I think in this way? and trying to do so. Evidently, in favor of the notion of causation there expressed is that it is so simple, so apprehensible. A cause is said to be that which produces a new state of things (effect), and after citing a number of instances, the generalization is reached, that there is no causation without motion, or in other words that cause is a motion. Motion being so intelligible, so familiar to us all, if we could discover that every change is preceded by motion of some sort, we should be perfectly satisfied, and mystery would so far be banished from the world. When we see a stone rising in the air, our causative instinct is perfectly satisfied when we learn that some one has thrown it—the movement of the arm having been transferred to the stone.

But as I turn over all possible cases of change in my mind, to see whether the new formula will fit them, one occurs to me which is perplexing. When a stone goes up, the motion of an arm is a sufficient cause; but how when the stone comes down? Can we discover any motion that makes it come down? Dr. Carus refers casually to such an instance. "The cause may be that my fingers let it go." This might answer when I am on an elevation and do let it go. But how when I throw it into the air, and stand on the ground? The movement of my arm is exhausted in its rising; what causes its falling? Dr. Carus does not fall into the popular error and say gravitation makes it fall; for as a philosopher, he knows that gravitation is simply a generalized statement of the fact that it (and every body) does fall (or tends to). Gravitation is a law (using the word in a metaphorical sense), not a cause. Why then does the stone fall, again I ask? If some one were up there, or if there were any movement up there transferring itself to the stone, I should be no longer perplexed and the new formula would hold good. But plainly this is not the case. It looks as if there were change without any antecedent motion. The only antecedent motion was that of the rising stone,—and this has exhausted itself. If there is a cause, apparently we cannot discover it. And yet we are as sure as we can be of anything that there is a cause for every change. But perhaps the cause need not be a motion; in that case the new formula would break down. Of course this is only a single instance and many others can be conceived of, where the formula applies perfectly; still, it is an instance of something happening every day and every hour and every minute and everywhere through the known universe—and must plainly be taken into account.

(To be continued.)

## CAUSES AND NATURAL LAWS.

IN REPLY TO MR. SALTER.

Mr. Salter while trying to fit our formula of causation to all possible cases, presents an instance which appears perplexing. "When a stone goes up," he says, "the motion of an arm is a sufficient\* cause; but how when the stone comes down? \* \* \* It looks as if there were change without any antecedent motion. The only antecedent motion was that of the rising stone,—and this has exhausted itself."

The problem presented by Mr. Salter must be explained from the Conservation of Energy. The expression that a certain motion exhausts itself is ambiguous and will naturally lead to misconceptions. No motion exhausts itself. It disappears in one special

\*The expression "sufficient cause" has been purposely avoided in our discussion on causality. Every cause is a sufficient cause. The mere idea of insufficient causes is productive of confusion. However, reasons may be more or less sufficient.

form only to reappear in another form. There are two kinds of energy, potential and kinetic, or as Ernst Mach most graphically calls them *Kraft* and *Arbeit*. Kinetic energy or *Arbeit* (work performed) is motion, mechanical or molecular motion, heat, electricity, or magnetism. Potential energy is *Kraft* or force acting in things at rest—"energy of position." A stone of a certain mass that lies on the ground performs no work but in its weight it represents a certain amount of potential energy. Another stone of the same mass that lies thirty feet above the ground on the roof of a house, represents the same amount of potential energy plus the potential energy equivalent to the kinetic energy expended in lifting that stone thirty feet. If this stone is dropped from the roof its additional sum of potential energy is changed during the fall into kinetic energy. When the stone arrives on the ground it has lost the kinetic energy of its fall, and by this loss is created an exact equivalent of heat which, if employed to raise the stone, could lift it again thirty feet above the ground.

When a stone is thrown into the air, we transmit to it kinetic energy. When the stone for an imperceptible moment stays in the highest place of its rise, it may be considered as possessing in addition to its weight such potential energy as is equivalent to the kinetic energy which we have transmitted to it by the throw. If the stone is not somehow retained in the air, it will at once change this potential energy again into kinetic energy; it will fall down.

Conservation of energy means that the sum total of all kinetic and potential energy remains the same in the whole universe. Kinetic energy may be created from and may disappear into potential energy. There is no creation in the old sense nor any annihilation, but only change from one form of energy to another.

In the case presented by Mr. Salter, the cause of the stone's rising to a certain height is the act of throwing; and again the stone's rising is the cause of its being suspended for an imperceptible moment in the air. Being suspended there without support is the cause of its falling down. When arrested on the ground, the stone's downfall is the cause which produces heat. The heat is given off to the surrounding soil and atmosphere where the further effects become imperceptible to us; still, they do not cease to exist.

Cause is always a motion of some kind, but the explanation why potential energy is changed into kinetic energy, or why the stone is attracted towards the earth is not the cause but the *raison d'être*, the reason, of a stone's fall. Explanations of the effectiveness of causes under certain conditions are formulated by our scientists into what they call natural laws. Natural laws are abstract conceptions of a certain class of phenomena; they are thoughts which enable us to comprehend all causes of the same kind. Accordingly, gravitation is a law but not a cause.

Some critical minds may object: "This abstract idea of gravitation which has been formulated by Newton, represents a natural law; natural laws are not non-entities but realities which exist independent of our thought." My answer is: gravitation certainly is a non-entity, but in so far only as it does not exist of itself. It is real in so far as it represents a quality which has been abstracted from real things. Abstract gravity as a thing in and of itself is a non-entity; but things exist that possess weight and their quality of possessing weight is called gravity. A quality is not a cause, but a quality may serve as a ground or *raison d'être*, as a reason for the explanation of the effectiveness of a cause.

The stone is heavy, heavier than the air, therefore it falls to the ground; a balloon is light, lighter than the air, therefore it rises. The heavier air falling forces the balloon upwards. Heaviness and levity are not causes but qualities, which in certain cases will explain why bodies rise or fall.

Qualities are always present in things; they are co-existent with them and in them. Reasons, *raisons d'être*, or grounds, which from the qualities of things explain their actions under certain circumstances are of a general nature and apply to all cases of the same

kind. Causes are always transient phenomena in single and individual cases.

Gravitation, or the law of gravity, is applicable as an explanation to all cases when we have to deal with things possessing weight. In order to explain the fall of stones as well as the motions of heavenly bodies, Newton proposed the formula that the attraction between two bodies is directly as the mass and inversely as the square of the distance. We call it Newton's law, and speak of this formula as a natural law. Now, when we want to know why this law is valid, we do not search for its cause but for its *raison d'être*. When stones fall to the ground, the causes may be ascertained in every single case. The causes of the motions of heavenly bodies have been conjectured with sufficient plausibility as having arisen from an unequal distribution of matter in the gaseous nebula. But the *raison d'être* of Newton's law, if it were found, would not be the verification of a certain single event or fact or motion in a certain state of things, but a quality of matter or of its surrounding ether. If we could by logical reasoning and experiments prove that ether has the quality of pushing two masses toward each other, this quality of the ether may serve as a *raison d'être* for the gravity of masses. I do not mean to say that this explanation which has been proposed by Le Sage, is correct. On the contrary, I look upon it as a very vague and unwarranted hypothesis. New investigations may throw more light upon the problem of gravity. For an elucidation of the problem of causality it serves us as an instance only to explain the difference between cause and natural law. P. C.

## CORRESPONDENCE.

### FINAL CAUSE IN SCIENCE AND RELIGION.

To the Editor of THE OPEN COURT:—

The length of the reply of Mr. Theophilus and your careful and able reply led me to conclude not to ask for a single line of room for personal response. But when I read over the last sentence of my opponent I am so astounded as to simply request you to print a protest. He affirms that "The verdict of Science is that there is in nature neither a First nor a Final Cause," to which I add my most entire assent. But he has so left matters that he seems to attribute to me the opposite affirmation. By no word of mine could he justly infer that I would teach a doctrine of Final or Primal Cause. His communication moves back and forth from the assumption that I identify religion and science. I did nothing of the kind, as reference to my words shows clearly. I affirmed, and reaffirm that no religion exists or can exist which does not involve and rest upon a theory or set of theories which express the science of the present or the past. Our present Christian system is unfortunately involved with the science of 2,000 years ago. It is only a play with words, an avoidance of the matter in hand to say this is not real science. It was the knowledge of the age when it was first taught. Was Aristotle teaching Science or not? Yet much that he taught is disproved. Science is always clearly open to amendment. Mr. Theophilus begins by assuming an absolute unquestionable body of truth which he calls science. He then as arbitrarily assumes another body of false theories which he designates as religion. The divorce is unwarranted. I understand Monism to be that religion which, freeing itself from the narrower knowledge of the past, conforms itself to the cosmical apprehension of latest science. It is hardly necessary to add that religion involves both knowledge and admiration and aspiration;—thought and feeling. Monism is the advanced front of an age of science. It asserts that science is not materialistic, or agnostic, or atheistic.

But "Religion," we are told, "has been a matter of concern to the uncultivated and not to the learned." If Mr. Theophilus will refer us to a single one of the world's greatest, from Brahma or Zar-

athustra, down to Goethe, Shakespeare, Bacon, and Darwin;—from Socrates to Cavour, and from Lucretius to Mortillet and Huxley, who has been indifferent either intellectually or emotionally to religion, we shall have a beginning of a reason for trusting his assertions. It happens to be a fact that the world has been "God drunk," and no one has been too wise or great to escape the contagion. But "Science concerns itself with Being and its external relations," and religion involves the emotions. Mr. Theophilus is unable to establish any such dividing line. I am confident that there is a large percentage of emotion in Huxley, Haeckel, Darwin, Asa Gray, Agassiz, Tyndall, and in nearly every page they ever wrote. But perhaps I have not yet come upon the unemotional scientists.

On the other hand, if Mr. Theophilus will question any "uncultivated person" who is religious, he will find no difficulty in discovering that such a person's religion involves a violent assertion of a system of natural philosophy,—false in part no doubt, and in so far dualistic. Nor is it any less science because false, or any less religion because narrowing. It is an effort to get at the causative principle, the why and the wherefore. It is not impossible that Mr. Theophilus's own views may come measurably short of the absolute truth while the ignorant man's views are only in degree less inaccurate. Is Mr. Theophilus therefore only religious and not scientific?

But once more Mr. Theophilus speaks of science "as knowledge obtained through observation as opposed to opinion, authority, etc." How much of any one's science excludes opinion and authority? How much of our friend Mr. Theophilus's science? Will he be kind enough to publish for our benefit his absolute knowledge so that we may no longer be troubled with any opinions. The fact is my opponent has involved himself in an impossible undertaking. Religion and science cannot be never have been divorced.

Truly yours, E. P. POWELL.

#### THE PROBLEM OF CAUSALITY. COMMENTS UPON THE EDITORIAL OF NO. 33.

To the Editor of THE OPEN COURT:—

In your recent editorial upon "The Problem of Causality" you seem to leave almost untouched all questions in the domains of psychology and ethics, (1) and however valuable your definition of cause may be for scientific purposes it seems to me to be altogether too limited in scope for philosophical purposes. "Cause," you say, "being the factor that produces the effect or the new state of things, is a motion. It is an alteration in a certain state of things whereby a further alteration, a re-arrangement or a new combination becomes necessary." Now, a cause is that which produces, creates, or makes something, let it be what it may. (2) Motion considered by itself, or as abstract motion, is a nonentity; (3) considered in relation with phenomena, or matter, it is merely descriptive of a condition or state of being, phenomenal or real. Hence, how can we consider cause in any general sense (5) as a motion? (4)

If we wished to confine ourselves to the 'proximate cause' (6) or causes of those facts and occurrences which we observe in nature, would it not be more exact to say that material impact (7) is such cause, since it is the impact of the atoms or objective forms of matter, one upon the other or others, that stands nearest to the effect in point of time or succession of phenomena? Previous to impact there is motion, but it is not motion unqualified, alone and of itself, that is the cause of any change in phenomena, but it is the rather motion arrested by impact of particles or collision of bodies which immediately produces the new arrangement in statu.

Suppose that a cannon-ball were shot into space and there were no resisting medium in space: it is then logically conceivable that the ball would continue in motion forever without producing any effect, (8) True, it may be said that if there were no motion there would be no impact, but it may also be said that if it were not for

some other pre-existing condition or fact there would be no motion, and so on until we should simply perceive or be brought to the conviction that there is but an eternal regression of finite causes and effects (9), but the philosophical problem of cause would still remain unsolved. Your further definition of cause brings us, however, more fully upon true philosophical grounds; and if we may be permitted to construe "a certain state of things" to mean a certain state or condition of existence of the whole of the phenomenal universe (10) at a given point of time we should not be inclined to dissent from the definition you give, since the ultimate demands of our reason would in so far be satisfied; but in order to make the idea of causality complete, it would still be necessary to postulate an ultimate (11) Will and Intelligence (12) from and by virtue of which the succession of phenomenal events and existences flow and become intelligible to us.

M. A. GRIFFEN.

CHICAGO, September 17, 1888.

#### EDITORIAL REMARKS.\*

[(1) It was impossible to exhaust the subject in one editorial essay. The question of causality "in the domains of philosophy and ethics" has been discussed in the editorial of No. 33, "Determinism and Free Will."

(2) The definition of cause as "that which produces, creates, or makes something, let it be what it may," is objectionable, from our conception of causality. Creation in the old sense of the word has become an impossibility. The only possible kind of creation is one of form. Causality must be limited to the creation of new forms, or we shall lose ourselves in the many errors of dualistic philosophies.

(3) "Motion considered by itself, or abstract motion," is an idea. Abstract ideas are "non-entities" in so far only as they do not exist in their abstractness outside of our brains. Nevertheless, they are real; they exist in real things as their forms or qualities; and from real things they have been abstracted. Nor must it be forgotten that ideas possess another and indeed no less important reality. Physically considered, they are organisms in our brains. The mechanical work done by these minute brain-organisms is extremely small in comparison to the result obtained. Here is the *δύσκειν ποῦ πρὸς τὸ αὐτὸ καὶ κινήσει τὴν γῆν* † of which Archimedes spoke. An idea that is going to revolutionize the world may not cost more expenditure of energy than 0.001 foot-pound. These "non-entities," as abstract ideas have been called, are at the same time the most powerful realities in the world.

(4) Causation considered by itself is an abstract idea also. What has been said in (3) about motion holds good of causation. Causation in its abstractness may fitly be called "a non-entity" in so far as it does not exist by itself but in and with the things only.

(5) If Mr. Griffen means by "cause in a general sense" something different from "cause in the usual sense," we call his attention to the sub-title, "Wrong Conceptions of Causality, in No. 53, p. 1203. "General cause," in the sense of *raison d'être* or of what in German is called *Grund*, is no motion, for it is no cause. The *raison d'être* or ground of certain phenomena is their explanation which is formulated by scientists as a law. Cause is always a motion, a certain event, an occurrence; however, the *raison d'être* (being a reason) is an abstract idea, a generalization of many cases.

(6) One *raison d'être* if it is more general and better known, can be employed as an explanation for another *raison d'être* which is less general and less familiar to us. All *raisons d'être* (being mere abstractions) are co-existent while a series of causes cannot but be successive. If *raisons d'être* are confounded with causes, we enter into a labyrinth of most intricate mazes full of unsolvable mysteries. Such mongrel ideas as General Causes, Proximate Causes,

\*While writing these comments as briefly as possible, the editor takes for granted that the reader is familiar with the essay on The Problem of Causality in No. 55.

†Translated: "Give me a place to stand on and I will move the world."

Remoter Causes, First Causes, Final Causes, are the fabulous monsters that people its gloomy resorts.

(7) "Impact" cannot be thought of without motion. "Motion arrested by impact of particles" does not cease to be motion, although it may be changed by "a collision of bodies" in heat, or electricity, or magnetism, which are forms of molecular motion.

(8) If a cannon-ball is shot into empty space, the act of shooting is the cause and its motion is the effect. Its motion at a given moment must be conceived as the cause for its motion in the following moment. The law of conservation of energy is the *raison d'être* that under the supposed conditions would serve as an explanation for the continuance of the ball's motion *ad infinitum*.

(9) "Eternal regression of finite causes and effects" is a phrase very unfamiliar to my way of thinking. Does the word "finite" causes suggest a possible existence of "infinite" causes?—Probably our correspondent means by "an eternal regression" the possibility of going back from effects to causes, a process which can be carried on *ad infinitum*, or rather *ad libitum*. If this is the meaning of the phrase, the reader will find some explanation of the subject in the editorial of No. 32, "Infinity and Eternity."

(10) This is the exact meaning of our explanation of causality.

(11) How "an ultimate Will and Intelligence" differs from ordinary wills and intelligences remains problematic.

(12) We find that the sum of the angles of a plane rectangle as of those of any quadrilateral is always  $360^\circ$ ; that in plane triangles it is  $180^\circ$ ; we find that the planets move according to fixed laws and that the atoms combine in certain arithmetical proportions; in a word, we find order everywhere. The most complicated instances of this order are explainable from the most simple truths. Who would "postulate an ultimate Will and Intelligence" for the fact that two apples and two more apples will always make four apples? If the rule  $2 \times 2 = 4$  needs no explanation from an ultimate Will and Intelligence, there is no reason why Kepler's laws in Astronomy, or the law of multiples in Chemistry, need such explanation.

The postulation of a Will or an Intelligence behind the phenomena of nature as the source of order and law, will launch us into Dualism. It is an anthropomorphic conception which conceives of the immanent order as the work of an extramundane artisan.

Human intelligence is an expression, the highest known to us, of this general order. The general order of the world is the *raison d'être* of the possibility of economizing thought, and by the economy of thought we are enabled to crowd a more or less correct conception of the whole universe into the narrow bounds of our brain, which enables us to understand and thus to make use of "the phenomenal events" of nature.]

#### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

#### CHAPTER XXIV.

#### AMONG THE STUDENTS.

ANY one who would know the Professor at his best should see him sitting surrounded by his students, the mature man amidst blossoming youth, the teacher among his admiring scholars. For the greatest privilege of the academical teacher is, that he not only exercises a personal influence on the present, but ennobles the souls of men in later generations by his knowledge. Out of the many who listen to lectures a chosen circle attaches itself to the learned man, the tie of personal intercourse connects the teacher and the scholar, lightly formed but lasting; for what attracts one to the other, and often makes the stranger

after a few hours an intimate friend, is the pleasant consciousness that both value and appreciate the same thing.

This bond, so charming and profitable for both parties, is the noble poetry which learning grants to its votaries. Strangers and men of later generations judge the value of a man only by his books, but however valuable may be the products of a man's mind thus transmitted, it gives but an imperfect picture of it to later times; far different does the living source work in the souls of those who receive knowledge from the lips and eyes of the teacher. They are taught, not only by the substance of his instructions, but still more by his method of investigating and expounding, and, most of all, by his character and the original style of his discourse. For these warm the hearts of his hearers, charm their minds, and inspire them with respect. Such an impression of the human mind, which leaves its traces on many, is often more important in forming the character of young men than the subject-matter of the instruction they have received. The character of the teacher works in the scholars; new life is infused into them, and they imbibed not only his excellencies, but also, sometimes, his peculiarities and weaknesses. In each hearer the characteristics of the master assume a different aspect, yet in each the influence of his mind is apparent, even in minute particulars. The lessons which Felix gave to his wife were not the only ones given in his house. One evening of every week belonged to his students. There came, first, a few who wished to ask questions and obtain information about their work; afterwards, a greater number assembled. Ilse's room was also opened, and Gabriel brought tea and simple fare, and an hour passed in easy conversation, till, at last, the most intimate withdrew into the study of their teacher, and clustered around him in numbers almost too great for the narrow room. Here, also, the conversation was varied; sometimes a humorous account of what they had experienced, or discussions in which the Professor knew how to make his young friends take an active part, and, interspersed with these, rapid criticisms upon men and books, pointed remark and quick retort, such as are natural to those who can recognize long melodies by a few tones. At these receptions Felix disclosed his inmost soul with an openness that he never showed in the lecture-room. He spoke of himself and others without reserve, and entered pleasantly on what he had most at heart.

Ilse was no stranger at these gatherings. Those who assisted in them, whether serious men, old students, or young doctors, found pleasure in the presence of the distinguished lady of the house, who, in her simple way, took part in their intercourse. The year before she had shown her intimacy with the Odys-

\* Copyrighted.

sey, when she summoned the gentlemen to the enjoyment of a leg of wild boar, and expressed the benevolent wish that they would not disdain to partake of the meal. After that she was called Penelope in the circle, and she knew that this nickname spread among the students beyond the walls of her house.

Ilse had her favorites among the young men. Of this number was a worthy student, not the most distinguished, but one of the most industrious of the Professor's scholars. He was a countryman of hers and had been the first to show her that students had tender feelings in their breasts. This student had, during the last year, worked successfully in filling his intellectual vacuum with collegiate knowledge. His lyrics he had almost given up; for when the Professor sent him back his poems, he had felt remorse and humbly begged pardon. Since that, having obtained a good scholarship through Felix, he took a less misanthropic view of domestic affairs; he proved himself a faithful and attached companion, and now bore the honorable title of Doctorandus, which, according to our grammarians, signifies a man who is about to be a doctor; he had also attained a certain degree of recognition among the students; he filled a position of honor in the great Arminia corps, always wore their colors on his cap, and was ranked among the privileged seniors of the society who, on drinking evenings, were exempted from the heavier obligations of conviviality, and filled up by serious conversation the pauses in which the stormy youths took breath.

On one of these evenings the conversation took a learned turn even before the party had retreated from Ilse's apartment to the study. An interesting manuscript had been found in a distant library in South Germany. There was much talk about the discovery and the editor, and Felix recounted with satisfaction to some of his select circle all the similar discoveries which had been made during the last twenty years. Then our student, who had just received a cup of tea from Ilse, and was stirring it with his spoon, said, in evident ignorance of the storm that was lowering: "May there not be many things still undiscovered in the neighborhood? In my town there is an old chest, which contains books and papers from the monastery at Rossau. It is not impossible that there may be something valuable there."

Thus spoke the student, stirring his spoon, like a boy who applies a burning match to a bombshell.

The Professor started from his chair, and cast such a flaming glance at the student that in fright he quickly set down his cup of tea in order not to spill it. "Where is the chest?" said the Professor.

"Where is it? I do not know," replied the student, surprised. "I was told of it, some years ago, by a countryman of mine, who was born in the district of

Rossau"—the student mentioned the name, and Ilse knew the family—"but it must be in our county, for he lived there as tutor in several places."

"Was he a philologist?" asked an older scholar, as eager as the Professor.

"He was a theologian," replied our student.

A murmur of regret passed through the room.

"Then the account is still very uncertain," concluded the critic.

"Did the man see the chest himself?" asked the Professor.

"I am not certain of that, either," replied the student. "I did not then know the importance that attached to the communication. But, I think, he must have seen it himself, for I remember he said it was thickly plated with iron."

"Unfortunate man! You must do your utmost to procure us information about this chest," cried the Professor. He paced impatiently up and down the room, the students making way for him respectfully. "Your communication is of more importance than I can now tell you," began the Professor, stopping before the student. "Endeavor, in the first place, to recall what you have heard about it. Did your acquaintance ever see the chest open?"

"When I come to think of it," replied the student, "I believe that he saw some old monastic relics lying in it."

"Then it was no longer closed?" inquired the Professor. "And where is your friend, now?"

"He went to America last year with a brewer's daughter. I do not know where he now resides, but it may be ascertained from his relations."

Again a murmur of vexation passed through the room.

"Endeavor to discover the residence of the man; write to him, and ask for accurate information," exclaimed the Professor; "you can do me no greater service."

The student promised to do all in the power of man. When the party broke up Gabriel communicated to the student a secret invitation to dinner on the following day. Ilse knew that it would be agreeable to Felix to have the company of one who had even an acquaintance who had seen the chest that contained the books of Rossau, among which, it was possible, the manuscript of Tacitus might lie, provided it was not somewhere else.

She, however, did not hear with any satisfaction of the secret chest, for Ilse was, alas! incredulous in the matter of the manuscript. She had sometimes vexed her husband by her indifference on the subject, and, after the unfortunate Struvelius episode, avoided every mention of the lost treasure. She had, besides, special reasons for it. She knew how much every

thought and discussion concerning it excited Felix. He always became agitated, and his eyes shone as in fever. It is true he controlled himself after a few minutes, and laughed at his own fervor; but these outbreaks of latent ardor were not agreeable to his wife, for she saw by these sudden flashings that the thought of the manuscript still fretted the soul of her dear husband, and suspected that in secret he often dreamt of it, and entertained secret designs against the walls of her father's house.

Our student had now aroused the storm. Later, the doctor was called in and there was a long discussion and dispute. Ilse was glad that the doctor did not attach much importance to the chest, and by sensible suggestions brought the Professor at last to make humorous remarks upon his own eagerness.

When, on the following day at dinner, the student produced the letter he had written in proof of his zeal, the Professor treated the matter with more composure. "It is an uncertain account," he said, "even if the relator tells the truth; he may be in error concerning the particulars, or even the name of the monastery." When, afterwards, information came from the house of the student that the theologian had settled somewhere in Wisconsin as an apothecary, and that the student's letter had been sent to an uncertain address in a distant country, the whirlpool which the mention of the chest had provoked had subsided to peaceful ripples.

The greatest advantage consequent upon this episode came to our student; for the Professor imparted the account to the Chamberlain, and pointed out to him that in this chest there might be things of very great value. The Chamberlain had several years before held the post of castellan, and was well acquainted with all the relics of his sovereign's castles, and was aware that there was nothing of that kind to be found in any of them; but as the student appeared to him to be a favorite of the family, he took kindly notice of the young man, and offered to present him as a fellow-countryman to the Hereditary Prince. This was done. The consequence of the introduction was that our student was invited one evening on which the Prince received other academical acquaintances.

It was an anxious evening for the student, and the Arminian had various reasons to be mistrustful. For, this year, there had been violent storms among the students. It was the quarrel between the corps of Markomanns and the Society of Arminians that had raised the tempest. The recent cause of the storm was curious and instructive to those who watch the secret links of earthly events. The discord which had sundered the professors who were the representatives of ancient learning, the struggle between Werner and Struvelius, had not at the time much excited the aca-

demic youth. But, shortly afterwards, a song had come forth among the students, in which the adventure of Struvelius was treated disrespectfully. This song was a weak production; it was in the form of a ballad, and adorned with a refrain to this effect:

"Struvelius, Struvelius,  
Come out here with your Fidibus; \*  
Who burns himself will have a fuss."

The author was never discovered. But when one considers that this song, so far as could be perceived from its ludicrous style, was averse to Struvelius and in honor of Werner, and further, that it first appeared among the Arminians, and that among these children of Arminius was one who had cherished lyrical tendencies in the past; that this one belonged to Werner's circle, and that in this circle the parchment had upon several occasions been contemptuously treated as a fidibus, one cannot suppress the cautious supposition that our student had degraded his departing muse by this miserable performance.

This frivolous song had become popular with the Arminians; its refrain was heard in the streets sometimes in the quiet night; it was very vexatious to the Professor, and not less so to Werner's tea party, but it could not be put down by force. The song and its origin were matters of indifference to the Markomanns and their associates, but they did not sing it simply because it was modelled upon a drinking song of the Arminians. About the time that Werner entered upon his rectorate, some students of all parties were sitting together in a restaurant; a Markomann attempted to light his pipe by the gas-flame, and a spark burnt the ribbon of his corps-colors; whereupon some of the Arminians mockingly sang the refrain. The Markomanns sprang up and commanded silence. Numerous challenges were the consequence. But, unfortunately, the matter did not rest there. A number of Arminians had drawn up in front of the Markomann's club-house, and had openly sung the tune in an insolent manner on the main street; it led to disagreeable conflicts between the parties and the city police, and investigations and punishments were the result. Werner himself had, in private conferences with some of the leaders, done what he could to suppress the unfortunate song, and he had succeeded in banishing it at least from the streets. But the ill-will remained in their hearts. By various unfortunate occurrences it became clear that there was more disunion and discordant feeling among the students than usual.

The Arminian, as he hung up his cap in the Prince's ante-room beside the smart ones of the great Markomann leaders, anxiously revolved all this in his mind. The evening passed off more pleasantly than he had expected. In the august chamber the Markomanns

\* Fidibus—paper-lighter.

observed decorous civility. The meeting indeed was of some importance; for this was just the time when the students were talking about holding a great *Commers*\* to celebrate the anniversary of some university event. But, as often happens in the greater affairs of our nation, the feast was in danger of being disturbed by the quarrel between the clans. Now, while the Arminian was drinking punch together with the Markomanns, the Hereditary Prince expressed the desire to participate in the commemorative *Commers*; and Beppo, the leader of the Markomanns, explained to the Arminian his views as to how the quarrel might be adjusted. The Arminian offered to convey this proposal to his corps. When the Chamberlain hesitated as to the participation of the Hereditary Prince in the *Commers*, the Arminian, exhilarated by punch and the flow of conversation, assured him that his comrades would appreciate the honor done to their festival by the presence of the Hereditary Prince.

The efforts of our student were successful; the hatchet was buried, and the academic youths prepared for a festival in common. A large hall, richly ornamented with the colors of all the associations that took part in the *Commers*, was filled with long tables. At the end stood the presidents in festive attire, with their rapiers. On the chairs sat many hundred students, arranged according to their respective corps and clubs. Among the Markomanns were the Prince and his Chamberlain; and the Prince on this occasion wore their colors in honor of the corps. The full-toned melody of the songs, accompanied by stirring music, resounded through the room; it was a goodly sight to behold so many young men, the hope and strength of the rising generation, united in festive song, according to the old customs of the university. Hitherto the festival had passed without any disturbance. The Chamberlain, remarking that cheeks were beginning to glow, and the songs becoming wilder, so that the music was not rapid enough for the beating of the academic pulse, advised the Prince to retire. The Prince, himself excited by song and wine, immediately rose; before him walked all the nobility of the Markomanns to clear the way through the surging multitude. They were obliged to push through the crowd, who had risen from their chairs and were moving about in confusion. But it chanced that the Prince was cut off from his academical attendants and bumped against an insolent Arminian, who, emboldened by wine and embittered by the not very gentle touch of the advancing Prince, would not make way, but barred the passage intentionally with his elbows, and coolly proceeded to puff his pipe in the Prince's face. The Prince was inconsiderate enough to push the Arminian

roughly aside and cry, "You are an impudent fellow;" whereupon the Arminian spoke the fatal word, of which the consequence, according to academical custom, is either a duel or loss of honor to the person insulted. In a moment he was surrounded by the Markomanns. The same insulting word poured like hail from all sides on the audacious offender; but he drew out his card-case mockingly, and called out, "One after another; let the whole retinue follow suit; like master like man." When the throng became greater, he cried out to those behind him, "This way, Arminians," and began in loud bass tones the battle-cry of his corps:

"Struvelius, Struvelius,  
Come out here with your Fidibus."

The tumult spread throughout the hall; over chairs and tables sprang the Arminians to the aid of their endangered champion; the words of insult and challenges flew in volleys in every direction. In vain did the presidents call them to their places; in vain did the music interpose; the angry cries of the contending parties could be heard above the shrill *fanfare* of the trumpet. The presidents hastened together, and, passing along in close array, separated the contending parties. But the wild uproar was followed by violent discussions; the associations stood apart from each other; separate groups jeered at one another, and, according to the old custom of academic belligerents, endeavored gradually to drive their opponents to use the word of challenge. Some provoking expressions had already been used which were forbidden by the social rules of the University; blades were glittering in the air, and more than one hand clenched a wine bottle. The music struck up the national hymn, but it was untimely, and from all sides came the angry shout, "Stop it! stop it!" The frightened musicians were silenced, and a fresh outbreak of the tremendous tumult seemed inevitable, when an old leader of the Teutons, who knew his people well, sprang up into the orchestra, seized a fiddle, seated himself in a chair high up as director, and began the foolish tune, "*Ach, du lieber Augustin, alles ist hin.*" The music began in plaintive tones. Every one looked up, and at once noticed the eminent gentleman scraping strenuously on the fiddle; the mood of all was suddenly changed, and a general laugh arose. The presidents struck their blades on the table so violently that more than one broke, and commanded peace; the leaders of all the associations joined together, and declared the *Commers* to be concluded, and called upon the clubs and corps to return peacefully home, as they intended to take the affair in hand. The students crowded angrily out of the hall, and dispersed to their respective head-quarters; but in every group the events of the evening were discussed with vehement bitterness, and embassies passed rapidly from one camp to another throughout the night.

(To be continued.)

\*A festive and bilacious celebration, in honor of some prominent person, or commemoration of a great event.

## BOOK REVIEWS.

POLITICAL ESSAYS. *James Russell Lowell.* Boston: Houghton, Mifflin & Co.

This is a collection of essays on political subjects running over a range of thirty years, from '58 to '88, and therefore dealing with dead and living issues. Most of them have little more than an historical interest for the present reader, but Mr. Lowell has always stood before the American public as the representative of the most advanced and liberal opinions of the day, from the time of the publication of the Biglow papers to the present time, when he bears the rôle of an enlightened political independent. This latest volume of his will form a useful addition to the Lowell library every reader of thoughtful books wishes to own.

C. P. W.

THE VIRTUES AND THEIR REASONS. *Austin Bierbower.* Chicago: George Sherwood & Co.

We like this book predict for it a wide and helpful reading. Mr. Bierbower further describes the object of his work in the subtitle, "A System of Ethics for Society and Schools." After a short introductory chapter, the contents of this volume are arranged under the two heads of "Duties regarding Others Chiefly," "Duties regarding Self Chiefly." The book is designed to present the right rule and reason of good conduct, without going into metaphysical speculation on the same, in a clear, comprehensible style easily understood by young readers, and making the book suitable for school instruction. Its purpose and result are both to be warmly recommended.

C. P. W.

THE SAFE SIDE. A Theistic Refutation of the Divinity of Christ. By *Richard M. Mitchell.* Chicago: 1888. R. M. Mitchell, 6141 Stewart Ave.

The author says on p. 348: "Believing is supposed to be the safe side and vast numbers are held by that error into a partial support of a religion the first step in which consists in defaming God." To worship Christ, Mr. Mitchell declares, is a degradation of God. "In just that degree that a Christian is a believer in Christ," he says, "he is an unbeliever in God, and in just the degree that Christ is a Savior, God is a failure." \*\* From the consequences of actual sin there is no salvation. From the consequences of the mythical sins of Christianity there is no need of any." The book before us is a most vigorous protest against the belief in the divinity of Christ; to the prejudice that this belief is the safe side, the motto is opposed that "it is safe to know the truth." Love for truth and a truly religious spirit has guided the author in his labors. Through the briars and brambles of pagan conceptions in Christianity he breaks his way in the hope of finding a purer and truer Religion. If in our opinion he does not succeed, if on his way he cuts roses which he takes to be thorns and thistles, we nevertheless sympathize with his effort. *In magnis voluit ut est.* He does not in our opinion succeed because, while rejecting the divinity of Christ, Mr. Mitchell retains the unwarranted belief in a supernatural world. He says, "The reasons for believing that we are under the guidance of supernatural wisdom are much greater than ever known before, while the reason for unbelief has its base in that ungratified curiosity that cannot accept isolated unexplained facts." *The sum of all arguments against the existence of a God and of our own immortality.* "It amounts to but an expression of disbelief." This latter declaration refers to Mr. Spencer's "conception of the Unknown Cause" and supposes that Agnosticism represents the most advanced thought of radicalism. By the roses which Mr. Mitchell cuts down, believing in best faith to weed out tares, we mean his criticism of the Gospel of St. John. The fourth gospel, it is true, is the least historical and most unreliable as to facts in the life of Jesus, but it is at the same time the most poetical, most philosophical, and grandest gospel of the four. "The entire Christian system," our author says, "stands upon the gospel

those bishops then originated and the few interpolations they made in the other gospels. \* \* \* The original authors of the Synoptic Gospels no doubt believed what they wrote, their fault being in their judgment rather than in their honesty. The Fourth Gospel is the only one in which that mental condition of the author was reversed, and by his arts it has been made the most popular gospel of them all." Although it is more than probable that the author of the fourth gospel was not the apostle St. John, but some Alexandrian philosopher, we cannot agree with Mr. Mitchell when he considers the whole work as an imposture of the clergy, who "caused it to be written" because they greatly needed such a gospel that exalted Christ as the son of God. Fully agreeing with Mr. Mitchell that the fourth gospel has a later origin, and that its authorship by the disciple whom Jesus loved is a fiction, we consider it as a poem of philosophic depth and great religious enthusiasm, which boldly attempts to build upon the Neoplatonic philosophy an invisible and supernatural Kingdom where Christ is the king, adorned with a crown of thorns.

If the belief in a supernatural world with all its mystic impossibilities is accepted at all, there is to our mind no difficulty in accepting also the minor problems which, if considered in their non-metaphorical meaning, must also appear as absurdities.

As a very original chapter we point out "The Cause of the Crucifixion," in which Mr. Mitchell supposes that Joseph of Arimathea played an important part.

## NOTES.

Mr. Charles T. Palmer, the author of the article "The Uncertainty of the Law—Its Remedy," in this number, is the editor of the *Chicago Legal Adviser*.

With the poetical sub-title of *WOODNOTES IN THE GLOAMING*, Messrs. *Cupples & Hurd*, of Boston, publish an American edition of "Poems and Translations," by Miss Mary Morgan [Gowan Lea]. The "Poems" have been reviewed in No. 23 of *THE OPEN COURT*.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God.* By O. B. Frothingham. Price, 5 cents.  
*Lecture on the Bible.* By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
*Christian Propagandism.* By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
*God in the Constitution.* By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
*Compulsory Education.* By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
*The Present Heaven.* By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
*The God of Science.* By Francis Ellingwood Abbot. Price, 10 cents.  
*On the Vision of Heaven.* By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
*A Study of Religion.* By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
*The Battle of Syracuse.* Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$5.00.  
*The Bible and Science.* By John Weiss. Price, 10 cents.  
*The Sympathy of Religions.* By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
*Evolution and Religion.* By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
*Giordano Bruno and the Relation of his Philosophy to Free Thought.* By Thomas Davidson. Price, 10 cents.  
*Transcendentalism.* By Theodore Parker. 39 pages. Price, 5 cents.  
*The Public School Question,* as understood by a Catholic American and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

 Preis 25 Cts.

## Recent Contributions to 'The Open Court.'

### THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55, 56 and 57.

In the whole domain of Natural Science no field  
 of investigation affords such a fascinating com-  
 plexity of phenomena or such a varied wealth of  
 vitality as the Kingdom of the Protozoans, the minute  
 organisms revealed to us by the aid of the mi-  
 croscope. They inhabit the water we drink, the  
 food we eat, the air we breathe. They live as para-  
 sites in the intestines and flesh of animals, and in  
 plants; aiding or injuring their hosts, as the case  
 may be. They lie dormant in a particle of dust, a  
 legion in number. They roam free and unconfined  
 in a drop of water, there a world. Infinite in  
 number, variety of size and manner of appearance,  
 the same beings that the unaided vision of man  
 cannot alone discover, form no unimportant factor  
 in the construction of continents and in the con-  
 figuration of the surface of the globe. They are  
 the simplest known forms of life, and every contri-  
 bution that throws light upon their mode of ex-  
 istence, cannot fail to be of transcendent interest  
 to biologists and scientists in general.

M. Alfred Binet, the collaborator of Ribot and  
 Péro, and one of the most eminent representatives  
 of the French School of Psychology, has pre-  
 sented in this series of articles the results of the  
 most recent investigation into this department of  
 Life. Every phenomenon that the improved  
 methods of microscopic research have shown to be  
 indicative of an exercise of intelligence, will, or  
 feeling in these minute beings is fully discussed  
 and analyzed. M. Binet has added much by these  
 articles to the psychology of the microscopic world;  
 he has opposed many theories, confirmed others,  
 and advanced many conclusions of his own. The  
 correspondence elicited in France by these essays  
 will be published at the conclusion of the series.

The articles have been translated from the *Revue  
 Philosophique*, and the original cuts procured from  
 the publishers.

### THE FOUNDING OF OUR RELIGIOUS FREE- DOM.

By MONCURE D. CONWAY. In No. 52 and 53.

Mr. Conway here discusses a subject that the  
 present Centenary Era renders timely and inter-  
 esting. The glorious immunities of civil liberty  
 that our ancestors wrested from the grasp of feudal  
 traditions and confirmed by constitutional bul-  
 warks, were attended perhaps with greater bril-  
 liancy and marked by greater effort of acquisition;  
 but, from the standpoint of individual freedom,  
 liberty of conscience and the principle of religious  
 toleration rank not below them in importance. Mr.  
 Conway's story is drawn from unpublished sources,  
 from private manuscripts, and is in the main the  
 result of original research. The state of the Church  
 of England in Virginia, the apostolate of Samuel  
 Davies, the religious tendencies of colonial society,  
 the religious profession of men to become so fa-  
 mous in history, of Randolph, of Patrick Henry,  
 of Madison, and of Jefferson—are all described  
 and discussed, and the manner told in which both  
 the institutions and the men of that era affected and  
 influenced the founding of religious freedom in the  
 United States. The new light which Mr. Conway's  
 research throws upon this important chapter of  
 American history, will be welcomed by all.

### DETERMINISM VERSUS INDETERMINISM.

Prof. GEORG VON OTZSCHE. In Nos. 55 and 56.

Georg Von Oetzsch is Professor of Philosophy at  
 the University of Berlin. His name is well known  
 beyond the boundary of his country. The problem  
 of the Freedom of the Will has perhaps never been  
 treated in a clearer and more forcible manner. Con-  
 tributions on the same subject have been published  
 from E. F. Powell and Xenos Clark.

### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33,  
 34, 35, 38, 40, 42, 44, 46, 48, 51, 54 and 57.

The Science of the thousand-fold *moral effects of  
 physical causes* is still a sealed book to a large por-  
 tion of our fellow-men. The ethics we have in-  
 herited is biased by the tenets of an anti-physical  
 and anti-natural philosophy, and the tendency of  
 the latter has ever been to sanction and exagger-  
 ate the *physical effects of moral causes*. Dr. Oswald  
 says: "Our entire system of moral education needs  
 a thorough revision, and the success of urgent social  
 and ethical reforms depends on the radical recon-  
 struction of moral philosophy on a basis of natural  
 science." The subject is treated in the graphic  
 manner which has ever characterized Dr. Oswald's  
 contributions to the Literature of Natural History  
 and Anthropology. It is marked by the usual wealth  
 of illustration and abounds in felicitous and per-  
 tinent citations of historical and natural evidence.

### THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Prob-  
 lem of Causality. The surpassing importance of  
 this subject renders a clear conception of it abso-  
 lutely indispensable to correct observation and  
 sound reasoning. Despite this the problem has  
 been unbecomingly neglected, and this neglect has  
 given rise to innumerable errors and to an aston-  
 ishing lack of lucidity in scientific discussion.

The problem is treated with clearness and pre-  
 cision; simplicity of presentation being especially  
 aimed at.

### THE QUESTION OF IMMORTALITY

Is treated in the Editorial of No. 25. "Evolution and  
 Immortality." It is shown that immortality accord-  
 ing to the Monistic view is immanent; it is a con-  
 tinuance of ourselves in our children, in our ideas  
 and in the work we have done during life. Rudolf  
 Weyler in his essay, "THE PROCESS OF PROGRESS,"  
 in No. 24, speaks of death as a mere transition and  
 C. Billups in a letter of No. 23 criticises the wrong  
 notion of a transcendent immortality as taught by  
 Dualism.

### THE INDIVIDUALITY OF ATOMS AND MOLECULES.

Rev. H. H. HIGGINS M. A. In Nos. 43 and 42.

Mr. Higgins says: "Evolutionists have to  
 choose between discontinuity and the recognition  
 of a universal principle of life, which may be re-  
 garded not as mechanical, but as inherent in the  
 primordial atom." This idea underlies the theory  
 of J. G. Vogt also. But Mr. Higgins attributes an  
 individual *bias*, or life-unit, to every atom, while  
 Vogt postulates a continuous, contractile, elastic  
 world-substance, wherein the atoms of modern  
 chemistry are made to be centres of condensation.  
 Mr. Higgins hypothesis endows each atom with an  
 idiosyncrasy which comprehends all that determines  
 its individuality and makes it what it is. The essay  
 should be read in connection with a letter in No. 43  
 upon "The Origin of Life and the Problem of  
 Memory."

### THE FIELD-INGERSOLL CONTROVERSY

An editorial discussion of the Field-Ingersoll  
 Controversy and of Mr. Gladstone's Remarks upon  
 the same, will be found in Nos. 43 and 44. The  
 questions and issues involved are treated from an  
 independent and impartial standpoint. The inefficacy  
 of Agnosticism to approach a solution of the  
 religious problem is shown; Agnosticism being but  
 a negative view of the world. The true position  
 and significance of both parties in the development  
 of the religious idea are pointed out and each is re-  
 cognized as important and necessary to the ultimate  
 synthesis of religious truth, a religion which will in  
 clude what is good in all.

## GRIGGS'S PHILOSOPHICAL CLASSICS.

Under the Editorial Supervision of PROFESSOR G. S. MORRIS.

Devoted to a Critical Exposition of the Masterpieces of German Thought.

### NOW READY:

LEIBNIZ'S NEW ESSAYS CONCERNING THE HUMAN UNDERSTANDING. A critical exposition. By Prof. JOHN DEWEY, Ph. D., of the University of Minnesota. 16mo, 280 pages, price, \$1.25. Being Vol. VII. in the series.

"Professor Dewey's book is an able exposition of the thought of Leibniz, broad and generous in view, and scholarly in method. The volume is eminently worthy its association with the others of the series; and the series, as a whole, the best compilation—as far as it has gone—of German philosophic thought to be found in the English tongue."—*Chicago Times*.

HEGEL'S PHILOSOPHY OF THE STATE AND OF HISTORY. By Prof. GEORGE S. MORRIS, Ph. D., of the University of Michigan. 320 pages, 16mo, cloth, \$1.25.

"Not only students of philosophy, but many others who consider themselves more practical, have reason to thank Professor Morris for his excellent and painstaking work."—*Saturday Review*, London, Eng.

HEGEL'S AESTHETICS. By Prof. J. S. KERRY, S. D. D., of Seabury Divinity School. \$1.25. "It contains the whole essence of the *Aesthetics* in simple and compact form, illustrated by thoughtful, able, and invariably illuminating and judicious comments."—*Boston Saturday Evening Gazette*.

SCHELLING'S TRANSCENDENTAL IDEALISM. By Prof. JOHN WATSON, LL. D., of Queen's University. \$1.25.

"Readers who feel an interest in the subject can get a clearer and more sharply defined idea of what Schelling thought from this work than from months of study of translations."—*The Chicago Times*.

FICHTE'S SCIENCE OF KNOWLEDGE. By Prof. C. C. EVRETT, D. D., of Harvard University. \$1.25.

"The interpretation is concise, easy of comprehension, and wonderfully true to the spirit and thought of Fichte. Work of this kind could not be better done."—*The Critic*.

KANT'S ETHICS. A critical exposition by ex-Pres. NOAH PORTER, D. D., LL. D., of Yale College. \$1.25.

"It is perhaps the most systematic criticism of the 'Ethics' in the English language."—*The Allgemeine Zeitung*, Munich.

KANT'S CRITIQUE OF PURE REASON. By Prof. G. S. MORRIS, Ph. D., of the University of Michigan. \$1.25.

"A book like this is almost indispensable to the average student of Kant."—*The Nation*.

### THE VALUE OF THE SERIES.

"Griggs's Philosophical Series' is the most valuable philosophical publication for popular purposes which has appeared in this country. It is not a mere translation or re-publication of the great German masters, but a critical exposition."—*Christian Intelligencer*, New York.

"One of the most valuable literary enterprises of the day. Each volume is a condensed presentation made by an author who combines thorough philosophical study with literary talent, and who has each made a specialty of the philosopher whose work is interpreted."—*Boston Traveller*.

"The most important contribution that has been made to our knowledge of the greatest philosophic movement in the world's history."—*Chicago Tribune*.

"This series of Philosophical Classics, edited by Prof. George S. Morris, of Michigan, and published in the enterprising city of Chicago, . . . deserves to be much better known than it has hitherto been to students of German Philosophy on this side of the Atlantic. . . . The exposition of the works taken in hand is full and minute."—*Athenaeum*, London, Eng.

Bound in uniform style, 16mo, price, \$1.25 per volume, or \$8.75 for the set of seven volumes. Sold by book-sellers, or sent, postpaid, on receipt of price, by the publishers.

## GHOST STORIES.

A STUDY IN FOLK-LORE BY L. J. VANCE.

### PART I.

*How* There needs no ghost, my lord, come from the grave,  
To tell us this.

(Hamlet, I. Sc. IV.)

Why should a ghost come from the grave, or from some other silent place, for no earthly reason? But this is like asking, why should there be any ghosts at all? In these days of rapid transit and the electric telegraph, needs there a ghost to tell us that our great grandfather, or a rich relative, died the night before? Mr. Edison's phonograph has made the coming of a ghost from the grave wholly unnecessary, and quite out of place. For now, the voice of the Cock-Lane Ghost might speak to us from the eighteenth century with all the reality of a living voice, and besides, no one need be frightened half out of his wits.

Ghost stories! their name is legion. How shall we classify them? How shall we compare them! These stories are so numerous, so complex, and so arbitrary, that they seem to defy any sort of arrangement. They range from stories about ghosts taking the shape of cats and dogs, to stories about spectral figures, "arm'd at point exactly, cap-a-pie"; from the sounds of an invisible wood-cutter's axe in the forest, to the awful clanking of chains and the terrible rattling of windows and doors at midnight in an old English county house; from the spirits that come when the "medicine-man" or the "medium"-man calls them up, to the sprites that come when they like, without calling. Yet, we believe there is some method in all these seemingly inconsistent stories. We might point out that, those stories which Bushman and Hottentot tell of ghosts coming as Kangaroos and as Serpents, are only on a par with those stories which German and English peasants tell about Gabriel coming with his "hell-hounds." We might go on and remark that savages in Australian bushes have been warned by their fathers' ghost, just as the Duke of Buckingham was warned by the ghost of Sir George Villiers, his father. We might inquire whether a Keneka savage and Lord Lytton, both of whom were informed of coming death by ghostly visitation, are not "in the same tale." Finally, we might find that spirits "manifest" at an Esquimo or Maori *séance* the same as at an exhibition given in the dark by the Fox

sisters, and Mr. Slade. Obviously, all these strange stories should be made the subject not only of curious but of scientific inquiry.

Here, let me begin by setting forth what is the general object and scope of our present inquiry. It will not be our object to account for every detail of every wild and senseless ghost story. But I shall take for granted the general principle, that stories about ghosts were born of the savage fancy, which conceived among other things, the power and permanence of the souls of the dead; that these stories have been retained for the most part by rude and uncultivated people, by the Folk. Holding, then, that ghost stories were evolved by persons in the savage mental *status*, we shall regard the wild and senseless part simply as a "survival." Thus, my thesis in general will be that the supernatural *stuff* of ghost stories, the belief in the existence of the souls of the dead,—in the possibility of the spirits of the dead re-appearing in the form of animals or in the human form, in the power of the "medicine-man" or of the "medium" to exorcise the spirits, and in the presence of spiritual creatures that 'walk the earth unseen,'—is more or less the same all over the world.

But let not the timid reader be frightened by the somewhat formal phrases which I have been obliged to use in this exordium. The method and scope of this essay can best be stated in the simplest and plainest English. Thus the method we propose to apply to ghosts and ghost stories will be the so-called Comparative Method. By this method we collect the ghost stories of the civilized and the uncivilized folk, and point out the elements they have in common. We thus place a Hottentot, Esquimo, or Indian ghost story side by side with a Negro, German, or English tale of like character. Such is, we think, the true method of Folk-lore.

Let us grant, at the outset, that the straight and narrow path to Ghostland lies through Dreamland. Let us also grant that the savage draws no hard and fast line between dreams and realities, or, as Schoolcraft well puts it, "a dream or a fact is alike potent in the Indian mind." One of the earliest ghost stories in literature is told in the *Iliad* (XXIII, 70-100). There the shade of the unburi'd Patroclus appears to the great Achilles in a dream. "And Achilles sprang up

marvelling, and smote his hands together, and spake a word of woe: 'Ay me, there re-appeareth then even in the House of Hades a spirit and phantom of the dead, albeit the life be not anywise therein: for all night long hath the spirit of hapless Patroclus stood over me, wailing and making moan, and charged me everything that I should do, and wondrous like his living self it seemed.' Here, then, we have the framework, so to speak, of the early ghost story.

Now, this Homeric story also serves to illustrate the belief of early man in a soul or spirit separate and distinct from the body. Both Mr. Spencer and Mr. Tylor derive the belief in ghosts from the phenomena of dreams, of swoons, of catalepsy, of ecstasy, of visions produced by narcotics, and of other kindred phenomena. Both have adduced a vast amount of evidence to show that the soul without a burial place was a wandering spirit.\* Thus, the soul of the unburied Patroclus must forever wander under the form of a *larva* or ghost unless properly buried. Then came the belief, as M. Fustel de Coulanges has so well shown, that a wandering spirit became a malevolent spirit; it frightened the living by gloomy apparitions, and warned them to give sepulchre to the body.

I. Hence, we take, first, stories about "laying the ghost." Every precaution was taken to keep the ghost from troubling the living. The Australian cut off the right thumb of a dead enemy, so that his ghost could not draw a bow.† The Algonquin Indians beat the chamber in which the man died with sticks,‡ while the Chinese knocked the floor with a hammer.§ Some precautions taken to keep the ghost away were very odd, but quite effective. The efforts to deceive the ghost, though childish, were quite ingenious.|| Mr. Ralston relates how in Russia the peasants barricade the house and hang a sharp knife over the door. Plutarch curiously asks: "When a man who has been falsely reported to have died abroad, returns home alive, why is he not admitted by the door, but gets up on the tiles, and so lets himself down the chimney into the house? ¶

But to return to our ghost stories. The younger Pliny gives a very full description of a haunted house at Athens, in which the ghost startled people by what seemed the rattling of chains. Athenodorus, the philosopher, hired the house, and one night followed it out to a spot in the courtyard, where it disappeared. The next day a search was made, and a grave found. The bones were burned and the ghost never appeared again. A somewhat similar story is told in the *Mostellaria* of

Plautus, where a spirit was obliged to wander and to frighten people because its body had not been placed in the ground and proper rites performed.

Very few stories about "laying the ghost" have survived, because the beliefs from which they sprang, have not survived the shock of time. From the Middle Ages come numerous tales of ghosts being "laid" by sprinkling holy water over the grave. So, too, priests tolled bells to keep away the ghost. Again, we have stories of ghosts being frightened away by the celebration of a solemn mass. Such stories have not yet died out in England. In the *Folk Lore Journal*\* two folk stories of "laying a ghost" within a few years are recorded—the one a Birmingham story, the other a Cornish tale. In the latter case, the ghost was "laid" by the prayers of a clergyman.

II. We now take, for comparison, a class of stories in which ghosts are heard, not seen. These tales have a very wide range. Some of them seem to be explainable, while others, on any theory, seem to be inexplicable. I shall offer for consideration stories which the American Society for Psychical Research might investigate with success and profit.

The first story, we take, is a translation from Sahagun's *Historia General de las Cosas de Nueva España*. It reads as follows: "When so any man heareth the sound of strokes in the night, as if one were felling trees, he reckons it an evil boding. And this sound they (the Mexicans) call *Youaltepualli*, which signifies the 'midnight-hatchet.' This noise cometh about the time of the first sleep, when all men slumber soundly, and the night is still. The sound of strokes smitten was at first noted by the temple servants, at the hour when they go in the night to make their offering of reeds or of boughs of pine. . . . Whenever they heard such a sound as one makes when he splits wood with an axe, they hear hence an omen of evil, and were afraid, and said that the sounds were part of the witchery of the Tezeatlipoca, that often thus dismayeth men who journey in the night."

Then the learned Spanish missionary goes on to relate how, one warrior braver than his fellows, came up to the cause of the sound; how he caught it; and behold! "it was a man without a heart, and on either side of the chests two holes that opened and shut, and so made the noise."

Now, has this ancient ghost story any modern parallel? Yes, more than one. Let us now compare with this Mexican story of the "*Youaltepualli*" a story of the "midnight-axe" from the Galapagos Islands, as told by De Quincey. The gist of the story is as follows: "There was some old tradition—and I know not but it was a tradition dating from the times of Dampier†—that a Spaniard or an Indian settler in

† An early traveler and writer.

this island had been murdered in pure wantonness by some of the lawless rovers who frequented this solitary archipelago...attested by generations of sea-vagabonds, that every night, duly as the sun went down and the twilight began to prevail, a sound arose—audible to other islands and to every ship lying quietly at anchor in that neighborhood—of a wood-cutter's axe....Sturdy were the blows and steady the succession in which they followed; some even fancied they could hear the sort of groaning respiration which is made by men who use an axe, like those who in the town ply the 'three-man beetle' of Falstaff as paviors.... The close of the story was that after, I suppose, ten or twelve minutes of hacking and hewing, a horrid crash was heard, announcing that the tree, if tree it were, that never yet was made visible to daylight search, had yielded to the old Woodman's persecution."\*

De Quincey adds some further particulars:

"The wood-cutter would begin his operation soon after the sun had set; but uniformly at that time his noise was less. Three hours after sunset his noise had increased, and generally at midnight was greatest, but not always. Sometimes the case varied thus far: that it increased towards three or four o'clock in the morning, and as the sound grew louder, and thereby seemed to draw nearer, poor Pink's ghostly panic grew insupportable."\*

Lastly, let us compare both the Mexican and Galapagos story with a 'midnight-axe' story current in Cingalese Folk-lore. This story, called "The Mystery of the Pezazi," is told by Mrs. Edwards in *Macmillan's Magazine* for 1880. An abridged account of the mystery (quoted by Mr. Lang in "Custom and Myth") may here be given: "I lay, on the night in question, tranquilly sleeping, but gradually roused to a perception that discordant sounds disturbed the serenity of my slumber. Loth to stir, I still dozed on, the sounds, however, becoming, as it seemed, more determined to make themselves heard, and I awoke to the consciousness that they proceeded from a belt of the adjacent jungle, and resembled the noise that would be produced by some person felling timber. Shutting my ears to the disturbance, I made no sign until, with an expression of impatience, E— suddenly started up, when I laid a detaining grasp upon his arm, murmuring that there was no need to think of rising at present—it must be quite early, and the kitchen-cooly was doubtless cutting fire-wood in good time. E— responded in a tone of slight contempt that no one could be cutting fire-wood at that hour, and the sounds were more suggestive of

felling jungle; and he then inquired how long I had been listening to them.

"Now, thoroughly aroused, I replied that I had heard the sounds for some time, at first confusing them with my dreams, but soon sufficiently awakening to the fact that they were no mere *phantoms* of my imagination, but a *reality*. During our conversation the noises became more distinct and loud; blow after blow resounded as of the axe descending upon the tree, followed by the crash of falling timber."

It may be asked: What do you make of these three stories of the midnight-axe? How do you explain that, in Ceylon, the noises of midnight tree-cutting are attributed to a Pezazi, or ghost; that, in the Galapagos, they are referred to the spirit of a murdered Spaniard; that, in ancient Mexico, they are ascribed to a man without a heart? Frankly speaking, I make no explanation. I simply leave the explanation to those who heard the sounds of the old Woodman's axe.

III. In this connection I would briefly call attention to a class of stories in which musical sounds, "sometimes a thousand twangling instruments," are ascribed to spirits. The savage is keenly alive and sensitive to all the hidden sounds of nature. To his ear the air is full of supernatural noises. In the soothing of the tree-tops he hears the moans of a hapless spirit, while in the pounding drops of the waterfall he hears the drum-beats of a warlike demon or angry bogey.\* A story of this class may be found in the last number of the *Journal of American Folk-lore*. Mr. Chamberlain writes:

"The caverns in the hills around Burlington Bay and the head of Lake Ontario were looked upon by the Mississaguas as the abodes of spirits. One of these, at the foot of a steep precipice, from which the sounds of explosions were often heard, was called by them *Manito-ah wigwam* (the house of the devil). At the foot of a hill near the Credit village was a deep hole in the water. Here, the Indians said, a spirit was often heard to sing and beat his drum."

We place side by side with this, a story told by that renowned traveler, Marco Polo:

"Marvellous, indeed," he writes, "and almost passing belief are the stories reported of these desert phantoms, which are said at times to fill the air with choral music from all kinds of instruments, from drums to the clasp of arms, so that oftentimes a whole caravan are obliged to close up their open ranks and to proceed in compact line of march."

It is not necessary to spend much time on this

\* Ibid. p. 356. Pink was the nickname of De Quincey's brother.

\* "There is no music in Nature. Music is the creation of man. He does not reproduce any combination of sounds he has ever heard or could possibly hear in the natural world."—Hawai's "Music and Morals," p. 18.

class of stories. We content ourselves by citing two well-known instances.

One story is about the Drummer of Tedworth. Mr. Mompesson of Tedworth hearing a drum beaten one day, inquired what it meant. The bailiff told him that the people had for some days been troubled with an idle drummer. Mr. Mompesson sent for the man, carried him before a magistrate, and took the drum to his own house. After that Mompesson's family were badly frightened by midnight drumming—sometimes in the room where the drum lay, sometimes on the house-top.

The other story tells how Fastini, the musician, heard a spirit play a solo of singular beauty on the violin. After the spectre vanished, Fastini took his violin and composed a similar piece far superior to all his other compositions. He called the piece the "Devil's Sonata."

IV. Again, if the savage ear is preternaturally acute, his vision is unusually keen. He sees (dozing or awake) things which bear "no impression of the thing it was." We have a class of stories in which the ghosts assume the appearance of a fire or bright light. Some of these stories are well worthy of the attention of the Psychological Society. In his *Tales and Traditions of the Eskimo*,\* Rink says, that the Inue, or spirits, "have the appearance of a fire or bright light, and to see them is very dangerous." He then adds that they foreshadow "the death of a relative."† Many readers of the Odyssey will remember the scene where Telemachus cries out, when the goddess Athene, unknown to him, enters the room: "Surely, a great marvel is this I behold! Me seemeth that the walls of the hall, and the fair spaces between the pillars, and the beams of pine, and the columns that run aloft are bright, as it were with flaming fire." (XIX. 21-50.)

With this story we may compare the scene in King Lear (III. 4) where Gloucester's torch being seen in the distance, the Fool exclaims: "Look! here comes a walking fire," whereupon Edgar replies: "This, the foul fiend Flibbertigibbet; he begins at curfew, and walks till the first cock." Even into English poetry the story of

\* A wandering fire  
Kindled through agitation to a flame  
Which, oft they say, some evil spirit attends,"

has found secure lodgment. Milton seems to identify this spirit with the well-known "Will-a-wisp," "Peg-a-lantern," "Robin Goodfellow," and other similar figures in English folk-lore.

The negro story of the ghost of the blacksmith hovering as a bright light in the air will be found in Mr. Harris's "Uncle Remus" (No. XXXII).

It would be easy to multiply stories of this kind current in the lore of both civilized and uncivilized folk. But we conclude by giving a story which, so far as we know, is a quaint bit of superstition. It is printed in Grant's "Superstitions, Demonology, and Popular Delusions."

"The mysterious lights in the Gulf of St. Lawrence which are believed by mariners to be warnings of great tempests and shipwreck, were unusually brilliant in 1878. It is said to be a *fact*, established by the experience of a century, that when these lights blaze brightly in the summer nights, the phenomena are invariably followed by great storms. They give to the spectators on the shore the sight of a ship on fire. The fire itself seems to consist of blue and yellow flames, now dancing high above the water, and then flickering, paling, and dying out, only to spring up again with fresh brilliancy. If a boat approaches, it flits away, moving further out is pursued in vain. The lights are plainly visible from the shore from midnight until two in the morning. They appear to come from sea shoreward, and at dawn retire gradually, and are lost in the morning mist.

"Paradis, the French pilot, who took charge of the British fleet under Admiral Sir Hovenden Walker when it sailed up the St. Lawrence to seize Quebec, in 1711, declared he saw one of these lights before that Armada was shattered by the dreadful gale on the 22d of August. The light, he said, danced before his vessel all the way up the gulf. Every great wreck that has taken place there since Sir Hovenden Walker's calamity has been preceded, if tradition is to be believed, by these mysterious lights, and they have thus warned the mariner of fatal storms."\*

V. We take next a class of savage ghost stories which, for obvious reasons, are hardly ever found in modern folk-lore. We allude to those tales where ghosts make their *début* in the form of animals. An animal ghost story is usually a relic of the Totem stage of culture,—a relic of the time when men traced their descent from a beast, a bird, or a serpent, when animals were worshipped and feared as divine spirits, as gods.† It is now hard to find peasants who do not make their boogies something better than cats and dogs. Yet, in Miss Burne's book on "Shropshire Folk-Lore," there is an odd story of the Squire of Bagley, who, after his death, came as monstrous, savage bull. His body was laid in a church where he cracked the walls by his strength. "There are believers in this story," says Miss Burne, "who affirm that, were the stone to be loosened, the bull would come forth again by many degrees worse than he

\* Page 638.

\* P. 43.

† In a well-known English story a mysterious fire blazes from the lofty battlements just before the noble proprietors die.

was at first.<sup>1</sup> Stories of lycanthropy have been collected by a number of retailers of the gruesome and need not be repeated here. For example, one French writer has published a volume of modern French peasant stories about ghosts showing themselves in the form of beasts.<sup>†</sup>

But such ghost stories are interesting only as striking examples of intellectual "survival." They show the *persistence* of those low grades of thought and feeling that characterize primitive and uncivilized communities. Just as the refined Greek would not "let ape and tiger die," so the rude peasant on heath or by sea will not willingly let ghost and goblin die. He can no more help trembling at shades and shadows than the horse can help trembling at the sound and smell of a wild beast.

(To be continued.)

### MATHEMATICS AND LOVE.

BY \* \* \*

#### THE ELEGIAC DISTICH.

The distich has been justly regarded as the classic consummation of Greek verse. It was developed from the dactylic hexameter shortly after the time of Homer. The first line is an heroic hexameter, which is divided in the second or third foot by a *cæsural* pause. In the second line, the first half of the hexameter as far as the *cæsura* at the close of the fifth half-foot [-----] is twice repeated.

The adjoined diagram, in lieu of more specific rules, will serve to explain the distich, and shows the places where one long syllable is allowed to take the place of two short ones.

The second line of the distich is called a pentameter or five-measure line, as consisting of twice five half-measures. Yet, as a matter of fact, the pentameter has exactly as many bars<sup>‡</sup> or meters as the hexameter has, for at the close of each of the two divisions of the pentameter there occurs a pause of half a bar's length, just as at the close of the last foot of the hexameter there occurs a pause of a quarter-bar's length.

Expressed in musical characters, the distich reads as follows:

This form of verse is styled *Elegiac* by the Greeks and has been employed for contemplation and consideration of every sort.

The distich is in many ways comparable to the sonnet. As the distich was the classic form of ancient Hellenic verse, so is the sonnet the classic form of the Italian Renaissance. Both are very precise and rigidly defined. Like the sonnet, the distich cannot be sung to music; for the very reason, perhaps, that it contains the element of harmony in so high a degree that music can do no more to enhance its musical character.

But while in the sonnet the two parallel members (the rhymes *a b b a—a b b a*) come first in order and afterwards unite in a third part to a completed whole, in the distich, on the contrary, the dactylic hexameter, being the original unity, precedes and is afterwards resolved into two coördinate parts, which are formed by the component divisions of the pentameter. Thus, the sonnet is synthetic; the distich, analytic. Consequently while the sonnet with its elegance and euphony of rhymes is adapted to reflection and meditation, the distich in its finished brevity becomes appropriate to the aphoristic utterance of sentiments, pointed and antithetic comparisons, and epigrammatic thoughts of every description.

According to a widely prevailing notion, Science and Poetry are two unconnected branches that have nothing in common with each other. But this is a prepossession wholly unfounded. As Science can submit *all* things to a rigid investigation and exact scrutiny, so may poetry draw inspiration and enthusiasm from *all* that moves or thrills the human heart. As the psychologist may analyze the warmest feelings of the poet's soul, so too may the poet, in turn, enter into the spirit and feel the poetry of science. Though in itself science is not poetry, yet poetry is everywhere manifest in science. And no science is more closely akin to the spirit of poetry than Mathematics, in all its varied applications, particularly Mechanics and Statics. The Mechanics and Statics of emotional life, while they are scientifically investigated by the philosopher in his psychological studies, receive in poetry an audible expression, which can be measured, in the rhythm of verse.

<sup>†</sup> "Posthumous Humanity." By M. D'Assier. Translated by H. S. Olcott. London: 1885.

<sup>‡</sup> A meter in prosody is comparable to a bar in music. A foot is the ultimate unit of measure, be it dactylic, iambic, or trochaic, etc. Iambic meters (or bars) consist of two feet, — — — — —; but in the dactylic hexameter, a meter has but one foot.

\* The first bold (—) in the middle of the hexameter, corresponding to the *cæsura*, is moveable.

## THE OPEN COURT.

Mathematics is the prosody of the Universe. It explains to us the laws that control the rhythmic harmony of the great world-poem, as well as those that regulate the beating of the human heart. And in introducing, here, the science of mathematics into the domain of poetic art, we can choose no more appropriate form than the most elegant metrical creation of Greek antiquity—the elegiac distich.

## PREPARATORY REMARK.

Throughout the following cycle of twelve epigrams, all the similes are strictly applied in such a way as to preserve the same meaning in all instances. The mathematical line, being the product of a moving point, is a symbol of life. The plane, being produced by the second power ( $a^2$ ), represents love which widens man's interests and affords a field for his activity. The cube being the third power symbolizes family life; it is the solid building-stone, the living material which raises the dome of humanity.

An angle represents the inclination between two lives; and a triangle accordingly symbolizes a fixed relation. If the inclination of the two sides is that of a right angle, the hypotenuse represents the affection that two individuals bear to one another; the hypotenuse is the basis of their relation.

The circle naturally appears as the sphere in which an individual lives; it is one's self-hood, and the whole world of personal interests. Accordingly, among the trigonometrical functions, sine represents the other side of the right-angled triangle in its relation to the radius of one's world; tangent and co-tangent are the relations of the two connected lives to each other; and secant (being the hypotenuse of a right-angled triangle) is that mutual affection that carries the individual beyond the circle of self-hood.

The leading idea of these verses is expressed in the last epigram as being the perfect unity of order and reality, which is seen to be a congruence of mathematical and mechanical law with all the facts of existence, thus perfectly harmonizing the logical thought of our brains with the deepest emotions of our hearts.

## 1. THE MATHEMATICAL LINE.

LIFE is a function that comes from, and wanders to, infinite regions.

A geometrical point, constantly moving along,

Ever producing a line on the path of unlimited progress.

Past and future at once are in the present contained.

## 2. THE SQUARE.

LOVE is a life to its square. 'Tis the second potential that widens Man's aspirations; the plane gives his endeavors a field.

## 3. THE CUBE.

$$\begin{aligned} AB &= a \\ ABCD &= a^2 \\ ABCDEFGH &= a^3 \end{aligned}$$

WEDLOCK is life to its cube. It expands in substantial importance  
Based on the square of our love, happiness solid appears

## 4. THE TEMPLE.

LIFE to its cube is the hallowed home of a family circle,  
Where in the fireside glow new generations arise.  
Thus will the cube be employed as a stone for the grandest of structures,  
And its spontaneous growth buildeth the temple of man.

## 5. THE CIRCLE.

$$\begin{aligned} AC &= CB = R \text{ (Radius)} \\ \text{Circumference} &= 2\pi R \\ \text{Contents} &= R^2 \pi \end{aligned}$$

THOU art the central idea of all my thought and existence,  
If, o my love, in thy life I the circumference were,  
How concordant the circle would close as by magic agreement!  
Aptly, two fortunes would be spell-interwoven in one.  
Call it whatever you choose: alliance, love, harmony, concord,  
Duty, fulfillment, or bliss—none of the terms will suffice.  
Try to decipher the problem and, then, if you search for its reason,  
Learn! it is ruled by the law holding control of the world.

## 6. THE RIGHT-ANGLED TRIANGLE.

$\angle ACB = 90^\circ$  or a right angle.  
 $c$  the hypotenuse.  
 $a$  and  $b$  the sides.

LOVE the hypotenuse is and we are the sides, my beloved,  
Our inclination is right, right as the angle between,

## 7. SINE.

$$\begin{aligned} \sin a &= \frac{a}{c} \\ c &= R. \end{aligned}$$

SINE is thy bosom, adored one, thy heart and thy soul, thy all-being  
As to the radius it stands here in this circle of ours.  
Know that the radius forms the hypotenuse which has appeared as  
Symbol of holiest love. — Radius createth our world.

## 8. TANGENT.

$$\begin{aligned}\text{tang. } \alpha &= \frac{a}{b} \\ b &= R\end{aligned}$$

TANGENT the function is called of the sides that are touching each other;

And in the tangent, my dear, one in the other exists.

## 9. TANGENT AND CO-TANGENT.

$$\text{tang. } \alpha, \text{ co-tang. } \alpha = \frac{a}{b} \cdot \frac{b}{a} = 1$$

TANGENT, Co-tangent, my sweet one, will ever agree with each other;

Multiplied, lo! their result always is found to be one.

## 10. TANGENT 90°.

$$\begin{aligned}\text{tang. } \alpha &= \frac{a}{b} \\ b &= R \\ \alpha &= 90^\circ \\ \text{tang. } \alpha &= \infty\end{aligned}$$

TANGENT of ninety degrees expresseth the function of true-love,

Infinite certainly is th' only expression thereof.

## 11. SECANT.

$$\begin{aligned}\text{sec. } \alpha &= \frac{c}{b} \\ b &= R\end{aligned}$$

SECANT is cutting the circle of man's egoistic existence

But its relation refers back to the radius of self.

Love has transported my soul outside the domain of the ego

Purer to me it returns gentler and nobler from thee.

## 12. COSMICAL ORDER.

The laws of nature are:  
the mathematical thoughts of God.—Plato.

All the celestial bodies move strictly to laws of mechanics,

These are computed with care by mathematical minds.

But no lesser, my love, is the orderly law of our bosoms:

E'en in the depth of our hearts lives mathematical rule.

## HOW FAR DOES SCIENCE GIVE US CAUSES?

BY WILLIAM M. SALTER.

(Continued).

Another instance puzzles me. It happens to be one to which Dr. Carus makes special reference. It is the production of water. Dr. Carus justly says that so far as its material particles go, it has not been produced. They and their weight are the same as before. Water is simply a new form of its elements (and I may say, by the way, that in the significance which Dr. Carus and Mr. Hegeler assign to form, they seem to me to mark a great, an immense intellectual advance on the ordinary scientific thinking of the day). But what produces the form? The combination (the art of combining) of the elements, we are told. I confess I am not perfectly clear what is meant. "A chemist brings hydrogen and oxygen together." Is it the chemist's "art of combining" that is referred to? If so, what takes the place of the chemist in Nature's laboratory? Is the chemist an essential factor in the process at all? Is not the combining going on all the time? Something or somebody combines them—else there is a change without a cause—but what or who is it? In the case of the chemist, he no doubt makes some antecedent movements; but in nature is there any (discoverable) motion, save that of the elements rushing to join one another, which is just the change (in essence) that needs to be explained? Here, too, Dr. Carus will not put us off with so-called "chemical affinity;" for, like gravitation, this is but a generalized statement of the facts and gives not the slightest gleam of light as to what causes them. Is the cause a motion, and is it discoverable at all? No doubt, Dr. Carus is ready with an answer, and I ask, as no doubt other interested readers do, simply for light.

I might cite one or two other instances that give me difficulty; e. g. the formation of a crystal of salt. The pyramids of Egypt are perfectly explicable. They, i. e. their form, are an effect of human labor. How about the minuter structures, quite as complicated, quite as regular, quite as wonderful, that are being constantly produced without the intervention of any human hands? Is it possible that in place of the latter there are infinitesimal hands, and infinitely defter movements than any human hands are capable of, producing the tiny marvels? If not, what is the cause (or causes)? for motion of some sort it must be if the new formula holds good, and motion without something that moves is an abstraction.

Sometimes I am tempted to think that while science is a search for causes, it can only to a limited extent discover them. No one can willingly admit this; yet *a priori*, nothing can be said, so far as I can see, against such a possibility. We did not make the world or our own faculties, and we have to take them as we find them. To admit that there are causes which we cannot discover would not be to assert "the transcendence (or unknowability) of the law of causation." The law of causation is perfectly intelligible; there is no mystery about it; it simply asserts that for every

change, movement, or new state of things, there is a cause. But it does not say what the cause shall be, nor prevent its being undiscoverable. It is the cause that may be transcendent (or unknowable), not the law of causation.

(To be continued.)

[This part of Mr. Salter's article contains several questions, especially about the affinity of elements, the formation of a salt crystal, and the production of water from  $H_2O$ , which, in the editorial answer of this number, "Is There Anything Unknowable in Causality?", have not been discussed. We understand that Mr. Salter expects to hear our opinion on these matters in so far only as they can serve as instances for an explanation of the problem of causality, for we cannot in a philosophical discussion venture on those grounds of natural sciences which are not yet sufficiently explored, and in each case it takes a specialist even to present the problem in a correctly formulated way. Our problem at present is neither that of gravity, or affinity, or crystallogeny, but that of causality, and the purpose of our discussion is fully accomplished if we succeed in making the law of causation intelligible.]

The idea that many mysterious problems will find their solutions by a consideration of form has been discussed on page 1048 of THE OPEN COURT, in a letter on "The Origin of Life and the Problem of Memory." The significance of form will be discussed again, and on a broader basis, in connection with Kant's conception of the *a priori*, as soon as time and space will allow.

We shall recur to Mr. Salter's question as to "What takes the place of the chemist in Nature's laboratory?" and to the other subjects in our next issue, in so far as all these problems have reference to the idea of an animated nature. In reply to another question of Mr. Salter's, about self-motion, we shall discuss, in No. 60, the problem, "Is Nature Alive?"—Eo.]

## IS THERE ANYTHING UNKNOWABLE IN CAUSATION?

IN REPLY TO MR. SALTER.

Mr. Salter says: "The law of causation is perfectly intelligible \* \* \* it is the cause that may be transcendent or unknowable."

In no one of our examples can the causes be called transcendent or unknowable. Every cause is a motion or change of place and although there are many phenomena so complicated that we have not as yet been able to discover their causes, we are quite sure that the causes exist and that they are motions of some kind, ascertainable and measurable.

The cause, being a motion, is, as a rule, not very difficult to discover. The difficulty commences when we begin to search for reasons. In order to discover the cause of a phenomenon we have to observe the progress of motion, first the touch of the key on the piano, then the rising of the hammer, the vibration of the chord, the vibration of the air, then of the tympanum, then the irritation of the auditory nerve, and the perception of sound. In order to know a cause we must either directly or indirectly experience it. A cause is a fact, an event, an occurrence, that must be stated. Our reason, which is the faculty of comprehending, is called into action when we ask for an explanation of the fact. This explanation is something quite different from the cause of a phenomenon, for it is not a motion, not a single event, not a separate occurrence but a general law or an abstract rule, a formula that comprehends all possible instances of the same kind.

In former ages skepticism was more powerful and indeed more justified than it is to-day. The relativity of knowledge seemed to take all vigor out of science. The human race was recognized to be limited to this earth; how could a man dare to hope ever to know of what the sun and the stars consist! The impossibility of any knowledge of that kind appeared obvious. Man's eye is so constructed that the impressions of light require a certain time and

intensity; how can he ever expect to have information about the path of the lightning-flash or about stars whose light is not intense enough to impress the retina? The impossibility of any conception of that kind seemed plainly demonstrable. Man's ear can perceive sounds of certain pitch only; if they are too high or too low they will pass by unnoticed. These imperfections necessarily seemed to preclude man from any knowledge that lies without the range of his sensory organs, which are the basis of all his cognition. And yet, a few simple inventions have admitted us to all these seemingly inaccessible laboratories of nature. It is this very relativity of our knowledge, so often impugned, that allows an indirect, yet very reliable, apprehension where a direct observation is impossible.

Causes are facts of nature; and although it requires much ingenuity and critical discrimination, it is nevertheless comparatively an easy task, to trace them in natural phenomena. Our senses may prove dull in many subtle cases, but instruments for our assistance have been and will be invented. There is nothing to be comprehended in facts, they have simply to be stated. But the statement of the causes in a phenomenon is the raw material only with which science works. The causes of a phenomenon being known we search for its reason. The reason why the chord produces a certain sound must be sought in peculiar qualities of the chord and its surrounding air; perhaps also, in the manner in which the chord is struck by the hammer. The chord possesses elasticity and has a certain tension. Strings not possessing these qualities will produce other or perhaps no sounds whatever. If certain qualities are proven to be the conditions of the effectiveness of the cause, we can easily formulate this knowledge into an abstract law which will serve as an explanation for all instances of the same kind.

The word cause is frequently used to designate what we have defined as reason or *raison d'être*, although both ideas are essentially different things. And the license of language which has sanctioned this confusion, produces many most perplexing problems. Now, considering that causes are comparatively easy to ascertain, while most reasons, even of the simplest phenomena, can be found only with great difficulty, it seems probable that Mr. Salter means "reason" not "cause," when he says: "It is the cause that may be transcendent." The reasons of innumerable phenomena of nature are still unknown and are supposed to be unknowable by minds of mystic disposition. But their being unknown by no means justifies us in considering them as unknowable. The successful solution of so many perplexing problems should encourage our scientists to devote their efforts to those problems which appear hopeless to us now.

But the problem whether there is anything unknowable in causation lies deeper still. When dualistic philosophers so confidently speak of the Unknowability of a First Cause, they undoubtedly mean the ultimate *raison d'être* of phenomena, which would be the most general and therefore universal law, under which all the other less general laws had to be classified, and from which they will find their explanation.

If a group of phenomena is classified and formulated into a law, this law represents the reason why these phenomena occur. But with this the task of science is not yet exhausted. For our law representing the reason why, demands in its turn an explanation also, and we ask again what is the reason of this law. When we succeed in finding a reason for this law, it will be seen to be a more general law which shows that the first formulated and less general law is only a special and perhaps at the same time a complicated instance of other, simpler phenomena with which we are more familiar.

Let us take, for example, the phenomenon referred to by Prof. Mach on page 1175 of THE OPEN COURT. "Smoke rises into the air." \* \* \* We formulate a law that "heavy bodies

tend downwards and light ones upwards. It soon turned out however that even smoke had weight, and that it was forced upwards only because of the downward tendency of the air, as wood is forced to the surface of water because the water exerts the greater downward pressure." Thus many cases and formulas of quite different phenomena, which at first sight seemed to be irreconcilable, are comprehended under one more general law. Science went further. Newton discovered that the fall of a stone toward the center of the earth and the circuit of the moon around the earth could be classified as two instances of one and the same law, which has been called by one word—*gravitation*. Gravitation has so far solved very intricate problems. It has solved them, because we can think of many phenomena together as being produced by one and the same quality of matter. We thus "economize our thought" (as Professor Mach would express it) and, to use Professor Kirchhoff's words, we are thereby enabled to "describe certain phenomena of motion in the most simple and comprehensive way."

Gravitation, which is not as yet explained, can just as little be considered the *omni* of our knowledge in physics, as the idea of affinity is the *ultimatum* of chemistry. Gravitation demands its explanation also; and some scientists have ventured on the hypothesis that both affinity and gravitation are explainable from attraction. Gravitation would be the mechanical attraction between two masses, while affinity should be called molecular attraction. Even if this is true, we are still very far from seeing the *how* and *why* of this hypothesis, so as to propose it as a consistent and obvious theory.

The further modern science progresses, the more is the conception of monism realized, which teaches the unity of truth. All the different truths appear as so many applications of one and the same law. Now, suppose that we were in possession of all truth; the whole universe would be mirrored in our mind, methodically arranged. All the formulas and laws of the different sciences would be recognized to constitute one great system, and one law would be seen to pervade the whole. This supreme law being the most general would represent the ultimate *raison d'être* of all the other laws and it could not, in its turn, be reduced to a still more general law. Accordingly, the modern agnostic says, it is unknowable and it must be transcendent.

Agnosticism is the latest revival of skepticism. The old skepticism declared that we could know nothing: all knowledge is mere opinion, objective truth does not exist. Agnosticism marks in so far a progress as it limits transcendence to the "First Cause"; or, as we would express it, to the ultimate *raison d'être* of the world. There would be no objection to the agnostic idea, if the ultimate *raison d'être* were declared to be the limit of knowledge, the point where our investigation would naturally come to a halt. But then we must know that the whole of reality, with all its inexhaustible wealth of problems, lies within the bounds of knowability, while beyond that limit is empty nothingness.

Mr. Spencer says:

"For, if the successively deeper interpretations of nature which constitute advancing knowledge are merely successive inclusions of special truths still more general, it obviously follows that the most general truth, not admitting of inclusion in any other, does not admit of interpretation. Manifestly, as the most general cognition at which we arrive cannot be reduced to a more general one, it cannot be understood. Of necessity, therefore, explanation must eventually bring us down to the inexplicable. The deepest truth which we can get at must be unaccountable. Comprehension must become something other than comprehension before the ultimate fact can be comprehended."

Comprehension, it seems, has from the beginning been to Mr. Spencer something different than it is to us. How can it, all of a sudden, change into its contrary? Comprehension is the act of comprehending, or comprising; it is the act of grasping in our mind several things at once, being derived from *comprehendere*, to grasp together. To understand means the same. *Under*, in the Anglo-

Saxon verb *understanden*, has its primary sense of "among, between," as has the German *unter* and the Latin *inter*. *Understanden* means to stand under or in the midst of things, so as to see all the different aspects at once. The Latin *intelligo* (inter-lego) rests on the same figure of comparison. The concept and the word transcendence convey the idea that the solution of all problems should ultimately be sought outside of the world, behind or beyond the realm of nature, so that cognition would be obliged to transgress the sphere of knowability in order to get possession of it.

The ultimate *raison d'être*, far from being transcendent, would denote the most immanent quality of things. It would be the most obvious and most simple truth of which all other cases would be more complicated instances, for it would be used to account for all. Certainly, it could not be deduced from a more general statement, and in so far it would be "unaccountable" and "inexplicable." But at the same time there is no doubt that we would need no explanation, and in so far as this could be proven, it would be accountable and explicable.

It would be a great error to imagine that if we knew this most general law we would be in possession of the key to all the problems of the world. We must not forget that the more a statement is generalized, the emptier the circle of its contents will be of positive information. To know why and how all other instances are special applications of the most general law would be necessary also for their comprehension. Generalization is only one-half, discrimination is the other half of comprehension.

Dualistic philosophers have supposed natural phenomena to be mere shadows of the realities behind phenomena. They looked upon phenomena as visible effects of invisible causes. Cognition, they thought, penetrates through phenomena in order to get a glimpse of the real things. The discovery of natural laws seemed to afford such knowledge of what was considered the real and invisible causes. They appeared as eternal entities behind a transient sham-existence. Taking this view of nature, we shall inevitably come down to mysticism. From this standpoint the truism of the relativity of knowledge would be tantamount to a confession that real knowledge is impossible.

Monism rejects this dualism. The monistic view is positive, and positivism accepts natural phenomena as facts. There is no difference between primary, remoter, and ultimate facts. There is but one kind of facts: such as are real. Real facts, natural phenomena, are at the same time primary and ultimate facts. Knowledge of facts means that they are, as it were, mirrored in our minds. To know a thing means that its image exists in our brain as a feeling nerve-structure, which occasionally can become conscious. Comprehension does not go and cannot go beyond facts, but is simply a matter of systematic arrangement. A consideration of this kind, it must have been, that induced Professor Kirchhoff to omit the word "causes" in his definition of mechanics. His work, published 1875, commences with these words:

"Mechanics is the science of motion. Its object we define to be this. To describe with *exhaustive thoroughness* and the greatest attainable *simplicity* the motions that are taking place in nature."

In his inaugural address upon entering the Rectorship at Heidelberg, in 1865, Prof. Kirchhoff had spoken of "the causes that condition motion." The omission of the word cause, therefore, marks a progress from metaphysics (or at least the possibility of metaphysics) to positivism. All our knowledge is a description of facts, and all our comprehension is economy of thought, through greater simplicity combined with exhaustiveness.

The law of causation applies to all natural phenomena, but not to nature as a whole; it accounts for the single things as such, *i. e.*, it explains why they appear in these special forms. But the law of causation does not apply to existence in *abstracto*. Abstract existence can have no cause; abstract existence is simply the statement of the self-evident fact that existence exists.

If there is anything transcendent, it is these facts themselves in their stubborn reality. All their relations are knowable, all their qualities can be explained, and their forms accounted for; but their abstract existence, why they are at all, why anything and the whole world exists, remains and will remain what it always has been—a fact. If this absoluteness of facts is to be called transcendancy, we must confess that transcendency and immanence are two aspects of one and the same thing, for there is nothing so immanent in the world as its reality or the fact of its existence.

P. C.

## THE STONE'S FALL.

IN REPLY TO MR. SALTER.

We must recur to Mr. Salter's instance of the stone's fall once more, because of an expression in our reply (p. 1241, first column, lines 32 and 33), which cannot but be misleading. "Being suspended" conveys the idea that there is no motion or change of place at the moment when the stone reaches the highest point of its rise. The fact is that the stone from the beginning of the throw to its subsequent descent never ceases to be in motion, although the velocity of its ascent is constantly decreasing and when it becomes zero, the direction of its motion upwards is changed into a downward direction.

The whole phenomenon is a combination of two forces acting upon the stone: *first*, that of the throw, which is caused by the effort of my hand; and *second*, that of gravity, which is\* the downward pull towards the earth. The force of gravitation is continually acting upon the stone; but, inducing in the stone a less momentum at the start than the momentum imparted by the throw, the stone rises. The momentum produced by the force of gravity in the direction of the earth is continually and rapidly increasing and will soon be greater than the momentum produced in the upward direction by the throw, which remains constant. When the stone reaches the highest point of its rise, the momentum induced by gravity has become equal to the momentum imparted by the throw; the stone *seems* to rest for an imperceptible moment before falling; but it is just as much in constant motion as if it were thrown in a curve; *there is no new cause interfering, nor is any new force called into activity.*

Causation is the progress of motion. The progress of motion takes place under certain circumstances, (which on page 1201 have been called conditions, if they are indispensable). The circumstances in this case are the mass of the stone, its distance from the centre of the earth, the mass of the whole earth, the acceleration due to gravity, the resistance of the air, etc. An inquiry into these things and their qualities would afford us the *reasons* of the stone's fall; and these reasons, of course, are not motions; they are formulated as natural laws. The circumstances, being certain qualities, are in this case, as in most others, productive of additional motion; potential energy is changed into kinetic energy. But without a preceding change of place this would be impossible; there must be a motion (a change of place) of some kind, to *cause* such a change.

An avalanche would lie for all eternity on the Alpine ridge if it were not started by some motion. But under certain conditions the flapping wing of a bird might suffice to hurl the whole mass down, thus creating kinetic energy of an enormous amount through an almost imperceptible cause. No phenomenon in nature without a cause; and the cause is always a change of place, a motion of some kind.

P. C.

\* The downward pull is not *caused* by gravity; it *is* gravity. Gravity is a quality that always exists in and with things.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXIV—Continued.

The Chamberlain had extricated the Prince from the throng after the first encounter. The latter was sitting in his room, pale and dismayed at the consequences likely to ensue from the unfortunate incident. The Chamberlain also was terrified, for the responsibility of this fracas would fall upon his head. Besides this he felt real sympathy for the young Prince, who so deeply felt the insult to his honor, and who, with a fixed and saddened gaze, received no comfort from the assurance that his princely honor could suffer no more injury from these plebeians than from the sparrows on the tree.

After a sleepless night the Prince received the leaders of the Markomanns, who came to announce the decision of their corps. They stated that their senior officer, Beppo, had been chosen to represent the Prince in all further dealings with the Arminian, and he, Beppo, chivalrously begged him to concede to him this honor; he added that, in the opinion of his association, the Arminian had no claim to the privilege of receiving a challenge in consequence of that vile insulting word, and if the Prince should refuse any further participation in the matter, the Markomanns would take all the consequences on themselves. But they could not conceal from him that they alone held this view, nay, even some of their own corps had objected. All things, therefore, considered, they thought the best course would be for the Prince to make this concession—the greatness of which they undoubtedly deeply felt—to the academical custom.

The Prince had not yet recovered his self-possession, so the Chamberlain begged the gentlemen to allow his Highness some hours for reflection.

Meanwhile our student, who had been restrained by the consideration of his academical duties, and had kept aloof from any personal implication, in great perplexity went to the Doctor with this news, as in this affair he could not venture before the Rector. The Doctor hastened to his friend, who had already had an account from the beadles and the police.

"As regards the personal conflict of the Prince, I have as yet received no notice, and it is perhaps desirable, both for him and the University, that it should not be entered into. I shall be watchful and endeavor to provide against further consequences; and I shall perform the duties of my office in every direction in the strictest way; but do your best to prevent my learning any details of this affair, except what may give me just ground for taking official steps."

The Chamberlain was almost in a similar quandary as our student; he also went full of anxiety to the Doc-

\* Translation copyrighted.

tor, related the quarrel, and asked what the Doctor considered was the duty of the Prince, and whether he ought to allow himself to be represented in a duel.

The Doctor replied, with some reserve: "Duels are senseless and wrong! If the Hereditary Prince is imbued with this view, and is willing to take upon himself the consequences to his own life, and at some future day to his government, I will be the last to oppose this martyrdom. But if your young master is not free from the prejudices of his class, and has been impressed with the idea that there is a certain honor for cavaliers and officers, which is different from that of men of honor in general, and which, in certain cases, makes a duel necessary, if your Prince is going to decide the question upon these grounds, and in future govern according to such views, in that case I will unreservedly acknowledge that I cannot allow him the right to set himself in opposition to the ideas of honor of our academical youths."

"Then you are of opinion," said the Chamberlain, "that the Prince must consent to the offer of a representative?"

"I have neither the right nor the wish to offer an opinion," said the Doctor. "I can only say that the idea of a representative does not please me. It appears to me that the affair is simple,—either reason or personal courage."

The Chamberlain rose quickly. "That is quite impossible; it would be an unheard of deviation from custom, and would produce new and painful complications for the Prince; it is also entirely contrary to my convictions of what is allowable to a royal prince, and under no considerations can the proposition be further entertained."

The Chamberlain went away not much pleased with the radical views of the Doctor. On his return home he said to the Prince:

"The affair must be settled quickly before your father can learn of it. Your father, considering the social standing of your opponent, would positively prohibit any concession on your part; and yet I see that the future intercourse of your Highness with the body of the students, and even perhaps other personal relations, will be greatly endangered if the public opinion here is not in some measure satisfied. If, therefore, I may counsel your Highness, it will be to make a great concession, and accept Herr von Halling as your representative."

The Prince looked down, depressed, and finally said: "That will perhaps be best."

The great leader Beppo, one of the best swordsmen of the University, was to fight for the Hereditary Prince. But now it appeared that the Arminians were by no means satisfied with this idea of a representative, and raised the impudent pretension that the

Prince should himself appear before them in fencing attire and cambric shirt. The stout Ulf, for instance, the originator of the whole embroilment, declared that he found the Markomann leader also on his list, and he would not renounce the delightful prospect of having a pass with that gentleman in his private capacity.

This could not be denied. Meanwhile a large council of seniors, which the Markomanns had quickly called together, decided that a substitute should be allowed to enter the lists for the Prince. On the other hand, their cunning proposition that the Arminian should first enter the lists against the other men of their corps, was declined. They wished by this to relieve the Prince of the whole affair, as it might be assumed that even the great strength of the Arminian would be exhausted before half the names on his list were cancelled. Nothing, therefore, remained but for the two combatants to fight together at two different times, the Markomann, in the name of the Prince, first.

"We shall do our best to make the second meeting unnecessary," said the Markomann significantly to the representative of the Arminian, on the breaking-up of the conference.

Every precaution was taken to keep the fatal duel secret; only those concerned in it knew the hour: even to their near associates another day was spoken of; for the beads were watchful, and the University had been called upon by the highest authorities to avert further consequences by all means in their power.

The day before the duel, the Prince invited the Markomanns to dinner, and there was so much talk upon relevant matters that the Chamberlain felt decidedly uncomfortable. Shortly before the breaking-up of the party, the Prince was standing with Beppo in a recess of the window; suddenly he seized the hand of the young man, held it fast, and his frame was violently convulsed with suppressed sobbing. The valiant youth looked at the Prince much moved.

"All will go well, your Highness," said he, consolingly.

"For you, but not for me," replied the Prince, and turned away.

As towards evening the Hereditary Prince walked restlessly through the rooms, the Chamberlain, who also wished to be relieved from his troubled thoughts, proposed that they should that evening pay a visit to the Rector. This was the only place where he was sure to hear nothing of the disagreeable history, and he was sharp-sighted enough to guess that this visit would be particularly agreeable to the Prince.

Ulf knew everything. Our student friend, who had involuntarily played the magpie, creating mischief between the parties, still haunted the neighborhood; he ventured, on one of the student evenings, to remain behind with Penelope when the others went into

the Rector's room; he related the whole quarrel, described the dangerous position of the Prince, and begged her to say nothing of the occurrence to her husband. When, therefore, the Prince entered, a forced restraint and uneasiness was manifest in those present. The Chamberlain was more charming than ever, and related agreeable Court stories, but without effect. The Prince sat embarrassed in his place, next to Ilse; he felt the seriousness of even her friendly words; he saw how sorrowfully her eyes rested upon him, and when they met his he turned quickly away. At last he began, with unsteady voice:

"You once showed me the portraits of famous men that you have; may I ask you to let me see the volume again?"

Ilse glanced at him and rose. The Prince followed her, as before, into the next room. She laid the volume before him; he looked over it without interest, and at last began, in a low tone:

"All I wished was to be alone with you. I am helpless and very unhappy. I have no person on earth who will give me disinterested advice as to what I shall do. I have given offense to a student, and have been bitterly insulted by him. And I am now compelled to allow another to fight out the quarrel for me."

"My poor Prince!" cried Ilse.

"Do not speak to me of it, gracious lady, with the feelings with which a woman would regard it, but speak, as if you were my friend in advice. That I should burden you with my troubles makes me feel at this moment contemptible to myself, and I fear I seem so also to you." He glanced gloomily down.

Ilse spoke softly. "I can only say what is in my heart; if your Highness has done an injustice, apologize for it; if you have been insulted, forgive it."

The Prince shook his head.

"That would be of no use, it would only disgrace me afresh in my own eyes, and those of all others. It was not on that point that I ask you. Only one thing I wish to know; ought I to allow another to fight my battle because I am a prince? All say that I must do it; but I have no confidence in any, only in you."

The blood mantled in Ilse's face. "Your Highness lays a responsibility upon me that frightens me."

"You once told me the truth," said the Prince, gloomily, "as no one on earth has yet done, and every word you spoke was good and from your heart. I therefore now pray you to give me your honest opinion."

"Then," said Ilse, looking at him eagerly, while the old Saxon blood boiled in her veins, "if your Highness began the quarrel, you must end it yourself like a man, and you must yourself take care that it is done in an honorable way. Your Highness ought not to

allow another to brave your opponent and endanger himself on account of the wrong you have done. To lead a stranger to wrong, to compel another to risk his life, while you quietly look on, would be worst of all!"

The Prince replied, dejectedly:

"He is courageous, and superior to his adversary."

"And does your Highness think it right to take advantage of your opponent by the powers of one who is stronger than yourself? Whether your representative wins or loses, you will be more indebted to him than you ought to be to a stranger; and through your whole life you will be burdened with the thought that he has shown courage, while you have not."

The Prince became pale and silent.

"I feel just as you do," he said, at last.

"Everything of this kind is dreadful," continued Ilse, wringing her hands; "everywhere there seems to be ill-will and thoughts of bloody revenge. But, if it is impossible for you to prevent a wrong, it is your duty to take care that it does not become greater, and that its consequences do not fall on the head of another, only on your own. My heart tells me that you must yourself do, if not what is right, at all events what is least wrong."

The Prince nodded his head, and again sat silent.

"I cannot speak of it to those about me," he began, at last, "least of all to him," pointing to the Chamberlain. "If I am to prevent another from fighting in my stead, it must be done immediately. Do you know any one who can help me?"

"My husband's office forbids his doing anything for your Highness in this affair. But the Doctor?"

The Prince shook his head.

"Our student," exclaimed Ilse; "he is truly devoted to your Highness; he is a countryman of ours, and feels greatly troubled about this matter."

The Prince reflected.

"Will you allow me to have the use of your servant for a few hours this evening, when you no longer need him yourself?"

Ilse called Gabriel into the room, and said to him:

"Do what his Highness desires of you."

The Prince approached the window, and spoke in a low tone to the servant.

"Leave everything to me, your Highness," said Gabriel, as he went back to his tea-cups.

The Prince approached Ilse, who was standing motionless, staring at the book.

"I have looked over the portraits," he said, with more composure than he had shown during the whole evening, "and I have found what I was looking for. I thank you."

Ilse rose, and returned with him to the company.

(To be continued.)

## BOOK REVIEWS.

CITIZEN'S ATLAS OF AMERICAN POLITICS: 1789-1888. With a Series of Colored Maps and Charts. By Fletcher W. Hewes, author of "Scribner's Statistical Atlas of the United States." Large folio, \$2.00. New York: Charles Scribner's Sons.

Mr. Hewes has added to the literature of American political history a most peculiarly valuable contribution. It is a *résumé* of American politics and statistics in the unique and comprehensive shape of an Atlas. By the aid of a semi-pictorial method, he brings before the eye at one glance what would require pages of text and dry statistics to cover. The entire history of the political parties from 1776-1888 is thus portrayed, and a more interesting study of the same matter has never been presented. Mr. Hewes's *résumé* of the political parties includes their origin, times of supremacy, analysis of votes in Presidential elections since 1824, given by States. The density of settlement, the illiteracy of the people, the wealth or poverty of different sections are made to appear at a glance and are so vividly impressed as not to be easily forgotten.

Comprehensive charts come to the assistance of the student of tariff, revenue, and wage problems, and he has at his command and before him material which would fill volumes if reduced to writing. Convenience is still further added by the use of different colors upon the maps and charts, which make each class of facts stand out distinct for itself. From these charts radiate various channels of statistics and facts from which any question of the student is answered, and by only a moment's search. Thus, for example, can be learned at a glance the comparative condition of the tariff and the wages of skilled and unskilled labor for any corresponding periods during the past 40 years. Wages and cost of living for the same time are likewise compared, and all are comprehended by the eye with no need of mental calculation. Import and export charts show clearly the progress of the various economic industries, and the corresponding increase or decrease of revenue and percentage of duty. The distribution of manufactures and of the wool product are set forth with singular lucidity on two large county maps of the whole Union. The strength of the total foreign population, and of the Irish, German, and other nationalities separately, receive five distinct maps. The geography of the political parties from 1823-1888 is shown, with winning votes by States and Counties. An historical epitome on two elaborate maps traces the political history of America at every point from 1636-1888, with the party platforms and principles of two years.

"By such aids," the publishers say, and we agree fully "not only the statistical and political economist, but the masses of the people who make public sentiment and shape public policy, may acquire that knowledge of the country and its resources which is essential to intelligent and successful government."

## NOTES.

The *Revue de Belgique* for August, in an article entitled "The American Isthmus," contains some interesting extracts from the diary of a voyage to Central America, in 1858, by Félix Belly, a concessionaire of the Nicaragua Canal. The concluding part of "Women in Ancient Egypt," by Emile Coemans, appears in the same number.

The poetical contribution "Love and Mathematics," in this number, has not been published for its poetical value alone. We see in this little artistic production an instance of the Conciliation of Science with Art, of the rigidity of logical and mathematical thought with emotional feeling. It is only another aspect of monism which, as THE OPEN COURT teaches, leads to a Conciliation of Philosophy and Religion.

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourne and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Janes. Price, 10 cents.  
A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR & CO., Publishers.

175 Dearborn Street, Chicago.

## FORMER CONTRIBUTIONS TO "THE OPEN COURT."

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychical connection of the whole has been attained in a much higher degree.

## A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$5.00 per year; 15 cents per copy.

CHAS. W. SMILEY, Publisher,  
Box 630, WASHINGTON, D. C.

Mr. GEO. WILKES COOKE will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Woman*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. Cooke's address is DENHAM, MASS.

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romane and Others.

THE OPEN COURT PUBLISHING CO.  
169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

## PRESS NOTICES.

"Full of novel thought."—*Chicago Herald*.

"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.

"The absurdity of the theory is manifest."—*New York Science*.

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.

"Max Müller's supremely simple theory is both disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,  
TORONTO, ONT.,

## Recent Contributions to 'The Open Court.'

THE FOUNDING OF OUR RELIGIOUS FREE-  
DOM.

BY MONCURE D. CONWAY. In No. 52 and 53.

Mr. Conway here discusses a subject that the present Centenary Era renders timely and interesting. The glorious immunities of civil liberty that our ancestors wrested from the grasp of feudal traditions and confirmed by constitutional bulwarks, were attended perhaps with greater brilliancy and marked by greater effort of acquisition; but, from the standpoint of individual freedom, liberty of conscience and the principle of religious toleration rank not below them in importance. Mr. Conway's story is drawn from unpublished sources, from private manuscripts, and is in the main the result of original research. The state of the Church of England in Virginia, the apostolate of Samuel Davies, the religious tendencies of colonial society, the religious profession of men to become so famous in history, of Randolph, of Patrick Henry, of Madison, and of Jefferson—are all described and discussed, and the manner told in which both the institutions and the men of that era affected and influenced the founding of religious freedom in the United States. The new light which Mr. Conway's research throws upon this important chapter of American history, will be welcomed by all.

## GRIGGS'S PHILOSOPHICAL CLASSICS.

Under the Editorial Supervision of PROFESSOR G. S. MORRIS.

Devoted to a Critical Exposition of the Masterpieces of German Thought.

### NOW READY:

LEIBNIZ'S NEW ESSAYS CONCERNING THE HUMAN UNDERSTANDING. A critical exposition, by Prof. JOHN DEWEY, Ph. D., of the University of Minnesota. 16mo, 289 pages, price, \$1.25. Being Vol. VII. in the series.

"Professor Dewey's book is an able exposition of the thought of Leibniz, broad and generous in view, and scholarly in method. The volume is eminently worthy its association with the others of the series; and the series, as a whole, the best compendium—as far as it has gone—of German philosophic thought to be found in the English tongue."—*Chicago Times*.

HEGEL'S PHILOSOPHY OF THE STATE AND OF HISTORY. By Prof. GEORGE S. MORRIS, Ph. D., of the University of Michigan. 320 pages, 16mo, cloth, \$1.25.

"Not only students of philosophy, but many others who consider themselves more practical, have reason to thank Professor Morris for his excellent and painstaking work."—*Saturday Review, London, Eng.*

HEGEL'S AESTHETICS. By Prof. J. S. KENNEDY, S. D. D., of Seabury Divinity School. \$1.25.

"It contains the whole essence of the *Aesthetics* in simple and compact form, illustrated by thoughtful, able, and invariably illuminating and judicious comments."—*Boston Saturday Evening Gazette*.

SCHELLING'S TRANSCENDENTAL IDEALISM. By Prof. JOHN WATSON, LL. D., of Queen's University. \$1.25.

"Readers who feel an interest in the subject can get a clearer and more sharply defined idea of what Schelling thought from this work than from months of study of translations."—*The Chicago Times*.

FICHTE'S SCIENCE OF KNOWLEDGE. By Prof. C. C. EVERETT, D. D., of Harvard University. \$1.25.

"The interpretation is concise, easy of comprehension, and wonderfully true to the spirit and thought of Fichte. Work of this kind could not be better done."—*The Critic*.

KANT'S ETHICS. A critical exposition by ex-Fres. NOAH PORTER, D. D., LL. D., of Yale College. \$1.25.

"It is perhaps the most systematic criticism of the 'Ethics' in the English language."—*The Allgemeine Zeitung, Munich*.

KANT'S CRITIQUE OF PURE REASON. By Prof. G. S. MORRIS, Ph. D., of the University of Michigan. \$1.25.

"A book like this is almost indispensable to the average student of Kant."—*The Nation*.

### THE VALUE OF THE SERIES.

"Griggs's Philosophical Series" is the most valuable philosophical publication for popular purposes which has appeared in this country. It is not a mere translation or re-publication of the great German masters, but a critical exposition."—*Christian Intelligencer, New York*.

"One of the most valuable literary enterprises of the day. Each volume is a condensed presentation made by an author who combines thorough philosophical study with literary talent, and who has each made a specialty of the philosopher whose work is interpreted."—*Boston Traveller*.

"The most important contribution that has been made to our knowledge of the greatest philosophic movement in the world's history."—*Chicago Tribune*.

"This series of Philosophical Classics, edited by Prof. George S. Morris, of Michigan, and published in the enterprising city of Chicago... deserves to be much better known than it has hitherto been to students of German Philosophy on this side of the Atlantic... The exposition of the works taken in hand is full and minute."—*Mind, London, Eng.*

Bound in uniform style, 16mo, price, \$1.25 per volume, or \$8.75 for the set of seven volumes. Sold by bookellers; or sent, postpaid, on receipt of price, by the publishers.

## GHOST STORIES.

A STUDY IN FOLK-LORE BY L. J. VANCE.

PART II.

VI. Let us take further, for the purposes of comparison, those stories in which ghosts come in order to give mysterious warnings. Sometimes the ghost is beheld at or about the very time its late owner departs from this world of trouble. At other times, the ghost comes to warn a living relative that the end is nigh. Again, the spirit of a very near and dear friend conveys a warning of coming death or disaster to his former companion. All of these stories are in vogue among people as uncivilized as the New Zealanders, all of them in vogue, also, among folk as civilized as contemporary Englishmen and Frenchmen.

The resemblances between stories of this kind are often very striking. Karen folk-lore accounts for the appearance of "doubles," by the theory that the spirit of the deceased has the power to announce itself whenever it likes. The natives of Madagascar tell similar tales of ghosts seen at their owner's decease, and account for them by a similar theory.\* In his "Traditions of New Zealand," Mr. Shortland gives a native story of this kind.† He says that a hunting party of Maoris started out, leaving behind a sick man of the tribe. Suddenly, while the hunters were sitting around the camp-fire the next evening, a relative of the sick Maori saw the features and form of his kinsman just beyond the light circle of the fire-light. He declared that he saw the spirit of his relative. When the party returned to the *pah*, they learned that the sick man had died about the very time his ghost was seen miles away.

From another quarter of the globe comes a parallel story. This time the story is about Jemmy Button, a young Fuegian, and his father's ghost. It may be found in Fitzroy's "Voyage of the Beagle." "While at sea, on board the 'Beagle,' about the middle of the year 1842, Jemmy said, one morning to Mr. Byno, that in the night some man came to the side of his hammock, and whispered in his ear that his father was dead. Mr. Byno tried to laugh him out of the idea, but ineffectually. He fully believed that such was the case, and maintained his opinion up to the time of finding his relations in Beagle Channel, when, I regret to say, he

found that his father had died some months previously."

It is a "far cry" from Terra Del Fuego to Australia, but none the less recognizable. A story of the ghost of a dead relative warning a Maneroo black fellow of his approaching dissolution may be found in Mr. Lorin Fison's "Kimalaroi and Kurnai." The story was told to Mr. Fison by the gentleman in whose employ the native had died. "The day before he (the native) died, having been ill for some time, he said, that in the night, his father, his father's friend, and a female spirit he could not recognize, had come to him, and said, that he would die next day, and that they would wait for him." Sure enough, the black fellow died, and "kept his appointment with the ghosts to the very day." Although Mr. Fison does not give them, he says, that he could give "many similar instances" which had come within his own knowledge.\*

Such tales have survived in the modern stories of "death-wraiths," of "doubles," or of "fetches." European folk-lore is replete with stories about "fetches" coming to warn persons of approaching disaster or death. There is, for example, a bit of folk-lore concerning an ancient English family to whom ancestral ghosts always appeared before the death of its head. In one case the ghost of a murdered lady wanders up and down the castle halls shortly before any member of the family dies; in another case, a supernatural light blazes from the lofty battlements just before the noble owner's decease.

The following is a typical ghost story of this class: "Many years ago, when an English ship-of-war was one night off the African coast, the officer on the watch became deeply affected in a manner he could not explain, and became partially insensible, and could not rouse himself before a cold hand touched him. He then beheld a white figure walking away. It turned round, and in the face he beheld the features of a brother in England. The spectre, after remaining a few seconds, vanished. On arriving in Great Britain, the officer discovered that his brother died on the very night he saw the apparition."

Sometimes the "double" appears only to warn a

\* Many classical readers will recall the tale told by Cicero in *De Divinatione* [1-27] of the two Arcadians, in which the ghost of one of the travelers appeared to the other and informed his late companion that he had been murdered by the inn-keeper.

\* Ellis, "Madagascar," Vol. I. p. 395.

† Page 140.

person of some impending danger. In the "Memoirs of Georgiana, Lady Chatterton," we have a story of this class.\* Lady Chatterton had gone to bed, but awakening in the middle of the night, she saw the face of her mother,—"the face deadly pale, with blood flowing on the bedclothes." In terror she sprang out of bed and rushed to her mother's room. There her mother lay just as she had seen her, "pale as death, and the sheet covered with blood, and two doctors standing by the bedside." She was then told her mother had passed through a severe crisis, but would not allow her daughter to be called.

I notice in this connection that mysterious knockings and unaccountable noises are taken by both uncivilized and civilized folk to indicate a ghostly summons. The Zulus say that ghosts of this kind talk in a low, whistling sort of a tone.† The same is told by the New Zealanders.‡ According to Pèrre le Jeune, the Alouquins say that these ghosts chirp like crickets.§ But squeaking is the language of ghosts in Polynesia, where, as Mr. Ellis says, the natives are in mortal fear of the sound.|| All these different savage ghosts seem to be related to the *Pötergeist* of German folk-lore.¶ Woe to the unfortunate mortal who heard the rappings of this *Geist* at night round the house, or in the forest, for his days were numbered!

As modern variants of this kind of a ghost story are so numerous, we content ourselves with giving only one parallel. "In the last century a gentleman in England was surprised one night by a sudden knock at the street-door, so loud that he thought an attempt was being made to break it open. Springing from bed, he seized a brace of pistols and was hastening to the door, when a second knock was heard, louder than the first. A third knock followed just as he was withdrawing the bolt, but on looking out not a single person was to be seen, though it was clear moonlight. Next post brought a letter informing him that a *near relative* in London had died just at the time the knocking alarmed him and his family, for they, too, heard the startling sounds." \*\*

Now, I do not suppose that the doors of a Bushman's hut are knocked by spirits, because Australian black fellows have houses without doors. But I do suppose that they have been warned by the ghostly knockings; that they have received the same kind of death messages, as have been reported in the "Proceedings of the Society for Psychical Research."

From a correspondent in Georgia there comes to

me an exceedingly curious story of the negro 'death-wraith.' According to the writer, an old plantation negro, named 'Mose,' for many years mourned the loss of his wife, 'Julee.' 'Mose' continually asserted, however, that the 'sperit' of his 'Julee' would yet make him a 'caul': for, just before she died, she promised to come back and let him know when he should join her in the spirit. One night, 'Mose' was aroused by a gentle tapping against the window. There, pressed against the pane, he saw distinctly the face of his dead wife. She seemed to beckon him to follow her. He felt that he must obey. But the 'sperit' led him a stern chase; all that night he followed the phantom over hill and dale, through forests and fields. The next morning, 'Mose' returned to the plantation utterly exhausted and broken-down. His face was thin and haggard, his clothes were torn in shreds, and altogether he presented a lamentable appearance. Said he: "Yes, massa, las' nite me foller Julee to 'er grave. I'se soon gwine, too." Nothing could rouse the old man from his fit of depression and gloom. He refused to eat, took to his bed, and within a fortnight was once more re-united with his Julee.\*

Another kind of a death-wraith not only does rapping, but speaking as well. A most astonishing story of this class was first printed by Messrs. Gurney and Myers in the *Nineteenth Century* for July, 1884, afterwards reprinted in their volume on visible apparitions.† I give the tale for what it may be worth. It was sent to the authors by Sir Edmund Hornby, ex-Chief Justice of the Supreme Court of China and Japan, and localizes in Shanghai. Sir Edmund begins by telling how it was his habit to allow reporters of the Shanghai press to come to his house in the evening to get his written judgments for the next day's paper. He writes:

"I had gone to sleep, when I was awakened by hearing a tap at the study-door, but thinking it might be the butler, I turned over with the view of getting to sleep again. Before I did so, I heard a tap at my bedroom-door. Still thinking it might be my butler, I said: 'Come in.' The door opened, and to my surprise in walked Mr.—. I sat up and said: 'You have mistaken the door, but the butler has the judgment, so go and get it.' Instead of leaving, he came at the foot of my bed. I said: 'Mr.—, you forget yourself!' He looked deadly pale, but was dressed in his usual dress, and said: 'I know I am guilty of intrusion.' After some parleying with the phantom of Mr.— about coming in the room, the ghost finally said: 'I pray your lordship give me the judgment, for my time is

short!" and ended by saying: "This is the last time I shall ever see you anywhere." Sir Edmund gave the points of his written judgment to the apparition who took it down in a note book. Then the ghost excused his intrusion, opened the door, and went out. Sir Edmund says that his wife was awake by this time on account of the noise made by the interesting colloquy above set forth. He told her then what he had seen.

The next morning he went to Court, and one of the first things he learned was the death of Mr. —. And it turned out that his decease was some time about the hour Sir Edmund was holding animated conversation with the wraith. He of course talked over the astonishing coincidence with his wife.

"As I said then," he writes, "so I say now, I was not asleep but wide awake. After a lapse of nine years my memory is quite clear on the subject. I have not the least doubt I saw the man—have not the least doubt that the conversation took place between us."\*

"I have not the least doubt I saw," etc. In this way the philosophy of "ghost-seers" is satisfied, and would thus impose its conclusions upon those who hold a far different philosophy. When the ghost-seer says, "Can I doubt the testimony of my own eyes?", "Is not 'seeing believing'?", he is apt to think that he has proved his case. He is right, and he is wrong: right in holding fast to the evidences of his own senses; wrong in trying to make other persons doubt the evidences of their own senses. It is urged, and urged very correctly, that, because some persons cannot see things materialize out of nothing when others *do see* such things, proves nothing. *Ergo*, you who do *not see* and hear ghosts or "doubles" should not hesitate to believe in their existence. We accept the premises, but dispute the conclusion. The keen-sighted Montaigne met this very argument at a time when the witchcraft delusion was rife throughout all Europe. It is far more probable, said he, that our senses should deceive us, than that an old woman should be carried up the chimney on a broom-stick; it is far less astonishing that witnesses should prevaricate than that witches should perform the acts that were alleged of them.†

But the point to which I wish to call attention here is, that the students of "visible apparitions," of "phantasms of the living," and of kindred phenomena, have not gone about in the right method. Thus, "The Society for Psychical Research," in England, set out with the express purpose of throwing light on a dark and mysterious subject. Yet, it has done little real work, except to collect a voluminous and heterogeneous

mass of ghost stories, of little use to anybody till it is thoroughly sifted and arranged. Then the Bishop Carlisle took up the subject where the Society left off, and, in several very scholarly papers in the *Contemporary Review*, attempted to give a solution.\* Plainly the Bishop's argument is colored throughout by his positive religious bias. He argues that, a "spiritual being should be able to hold converse with the spiritual part of men without the use of those *avenues* which the senses supply." Again, his theory of visible apparitions proceeds upon the "supposition of some kind of intercourse taking place between the spirit of one departed, and the *spirit of a living man*." May it not be, he asks, "that a communication made directly by one spirit to another may seem to arise from that action of the senses to which *mental impressions are usually due*?"† We reply that it may be, *provided* the good Bishop's theory, of some kind of intercourse taking place between the spirit of one departed and the spirit of a living man, is *true*.

Lastly, we notice the labors of the late Edmund Gurney and Frederic W. H. Myers in this fascinating field of a psychical study.‡ For a while these two inquirers were content to gather and to arrange the mob and rabble of ghost stories which pressed on them. As long as they did this, their studies had popular interest. But soon they soared into the region of metaphysics, and then we began to have fine theories about "thought-transference," "internal economy," "percipient," etc. They are responsible for a new word, *telepathy*—and a very good and useful word it is, too. However, their theory of "ordinary death-wraiths" is, that they are "dream-like projections from the mind of the percipient." Their latest thesis is stated thus: "*some of those hallucinations of one or more of the senses which correspond with objective events at a distance, and which, therefore, we term veridical, are caused by a telepathic impact conveyed from the mind of absent agent to the mind of the percipient, and rendering itself cognizable by the percipient senses in various stages of externalization, and with various admixtures of a dream-like or symbolical element.*" We claim that these theses possess the *prima facie* characteristic of a true scientific generalization.§

Now, let me here remark that there is a science—the science of folk-lore—which collects and compares the stories of different people, of the Folk, the same as Philology compares the speech of different tribes or different races. Which *method* is the more scientific?—a method which studies ghost stories without paying

any attention to the ideas out of which ghost stories were evolved; or—a method which would show that stories of ghosts are, for the most part, natural enough among the uncivilized, which would find out what points such stories have in common with similar tales current among the civilized? The notion does not seem to have suggested itself to psychical inquirers that the larger part of the modern ghost story is a "survival." Nor do these inquirers take into account the fact that, rude savages and untutored peasants are still in the ghost-making stage of the human mind. Consequently, it is through sheer neglect of this fact how, and by what manner, ghost stories are really made, that their fine-spun theories of spiritual intercourse between spirits of the dead and spirits of the living, come to naught.

VII. Let us conclude this class of stories by taking, for comparison, a famous ghost story which has puzzled the brains of not a few psychical inquirers. To the student of comparative folk-lore the point and moral will be sufficiently clear. The story I allude to has been recently told at very great length by the Rev. F. G. Lee, in his volume entitled "The Other World; or, Glimpses of the Supernatural."\* The gist of the tale is that a Lord Tyrone and a Miss—both being minors and orphans, were brought up together by the same guardian. They had (as with most young people) many discussions about immortality, the soul, and a future life. The outcome of their talk was that they made an agreement that whoever died first should appear to the living and declare "what religion was most approved by the Supreme Being." Miss—married a Sir Martin Beresford, and for a long time neither she nor Lord Tyrone showed any disposition to die, or to communicate the approved religion. Finally, one night the ghost of Lord Tyrone appeared to Lady Beresford, told her the future, although little was said about religion. "The ghost," said Lady Beresford afterwards, "struck my wrist. His hand was as cold as marble; in a moment the sinews shrank up, every nerve withered." Ever after that eventful night Lady Beresford wore a black ribbon round her wrist to hide the ghostly mark. "The black ribbon," says Dr. Lee, "was formerly in the possession of Lady Betty Cobb, who, during her long life, was ever ready to attest the truth of this narration."

Now, I do not know whether Dr. Lee ever read Crabbe's long poem of "Lady Barbara;" if not, he should have done so. The story is good, even though the lines be badly rhymed. In Crabbe's poem we are told how Lady Barbara and her brother read "every book, from crabbed Hobbes to courtly Bolingbroke"; how the two made a compact to reveal the truth of the spirit-world; how one night the ghost of the brother

came, and said "The word reveal'd is true; enquire no more." But list, in bidding me adieu, says Lady Barbara,

"A nameless pressure on my wrist was made,  
Then for that token on my wrist—'tis here,  
And very slight to you it must appear;  
Here, I'll withdraw the bracelet—'tis a speck!  
No more! but 'tis upon my life a check!"

It seems that the ghost forbade her to marry a second time,—another "check" upon her life. Although old enough to be mother of her lover, the widowed Lady Barbara defied the ghostly "check," and married just the same. But where did Crabbe get the story? The editor of his life and works informs us that "this tale was suggested to Mr. Crabbe by a Wiltshire friend, in which county the story is a most popular one."\*\* This may all be so, but the story was popular in France, for example, long before the days of the poet Crabbe.

A variant of the Lady Barbara tale may be found (with the wrist part left out) in the celebrated Duchess of Mazarin ghost story. The Duchess and Madame de Beauclair were schoolmates together. They read and speculated a good deal about the future life. Ere these titled ladies graced the Courts of King Charles II., and of his successor, James II., they made a compact, in which it was agreed that whoever should die first, would return and give the survivor an account of "what was doing in the other world." When the Duchess fell sick, Madame de Beauclair reminded her of the compact. Her Grace replied that she might depend upon her fulfilling her part. That was their last conversation. Years passed, so the story runs, and no voice or sign came from the dead. But one evening Madame de Beauclair was sitting alone, when, lo and behold! before her stood the form of the departed Duchess. The figure moved through the room, approached, touched her hand, and said, "This night, between the hours of twelve and one, you will be with me." The spirit then vanished away in thin air. At once Madame de Beauclair sent for her friends, and summoned a clergyman to administer spiritual consolation. "Talk not to me," said Madame, to those who tried to dissuade her from giving any attention to a delusion, "with the view of making me believe that my eyes and ears have deceived me. My time is short, I know I have seen the Duchess of Mazarin, and am convinced that her words will come true." Yet Madame continued in seeming good health, till twelve o'clock, when suddenly her countenance began to change, and before the hour was out, she was in spirit, at least, with her dear friend, the Duchess of Mazarin.

Now, I do not know whether these two ladies ever read William of Malmesbury's book. Perhaps not; but if they had, they would have found therein a tale

\* "The Other World," etc. By Rev. F. G. Lee. 2 vols. London, 1886. p. 52, et seq.

\*\* The Life and Poetical Works of Crabbe. 8 Vols. London: 1834. Vol. 7. p. 156.

of two "Clerks" in Nantes. The one was a Platonist; the other was somewhat of an Epicurean. In order to test the truths of their respective beliefs, they agreed that whoever should die first, would, if possible, come back within thirty days and declare the true philosophy. Some time afterward one of the 'clerks' died, but failed to reveal, within the specified time, whether Plato's "spiritual soul" or Epicurus's "physical soul" might either one be correct, or whether both were false. Suddenly, there appeared one day before the eyes of the astonished 'clerk' the form of his departed companion. The ghost told of his efforts to keep the appointment, but did not undertake to decide between the rival claims of Plato and Epicurus. Witness, that in bidding farewell the spectre let fall three burning drops of blood on the forehead of the philosophical 'clerk.' Whether this was done to keep the clerk from marrying or from Platonic love, William of Malmesbury saith not.

In conclusion, we again ask: Which method throws the most light on all these ghost stories—the psychical method, or the method of folk-lore? By the latter method we find Jemmy Button, a Fuegian, and an English naval officer telling substantially the same ghost story. We find New Zealander and Polynesian hearing the same kind of ghostly rappings to denote the death of a kinsman. We might watch Maneroo black fellow, Southern negro, English nobleman\* and Duchess of Mazarin—all keeping appointment with the ghost on "the very day." We might point to the similar workings of the Australian mind, of the mind of the "ghost-seer," and of the retailer of the gruesome. Is there reason for believing that the rude peasant, the cultivated Madame de Beauclair, the philosophic clerk of Nantes, think more correctly about ghosts and goblins than the uncultivated, unphilosophic Bushman? Modern spirit stories would seem to indicate that folk, high and low, do not always think correctly about the "choir invisible." Truly man is man, women women, wherever we find him or her. Thus, peasant and poet, Duke and Duchess, alike persist in the belief that "death-wraiths," "doubles" or "fetches," live, move, and have their being. Accordingly, ghost stories are found over the whole race, and over the whole world.

(To be concluded.)

#### HOW FAR DOES SCIENCE GIVE US CAUSES?

BY WILLIAM M. SALTER.

(Concluded.)

I agree with the editor of THE OPEN COURT in saying that the *causa sui* of Spinoza is one of the worst self-contradictions in existence. The only possible meaning such an expression can have is that the category of causation does not apply to the object of which such an affirmation is made. It is possible to say that a thing has no cause at all, *i. e.*, that it is self-existent. (1) According

to the materialist, matter is self-existent; to the theist, God is self-existent; and I do not see why this predicate does not belong to the "monist's" conception of the world as cosmos. The monist does not seek to explain the order of the universe; (2) it simply *is*, he asserts, always was and always will be,—in other words, it is an ultimate fact, just as to the theist God is. The childish question, Who made God?, of which some free-thinkers make so much use as a *reductio ad absurdum* of theology, could only come from the uncritical childish mind, which hastily supposes that for everything there is a cause; to the philosophical defender of theism the question has no meaning, just as to the materialist it has no meaning, to ask, Who made matter? The materialist supposes matter never began to be and that it is dependent on nothing else; the theist supposes God never began to be; the "monist" thinks the same of the cosmical order. The category of causation does not apply to these varying conceptions (*i. e.*, of course, from their respective points of view); causation only applies where there is change or something (at least, relatively) new.

If, however, *causa sui* is a self-contradictory conception, what can be said for "self-motion" or "spontaneity," which Dr. Carus says are the predicates or meaning of life? Can a body move itself? If so, what becomes of the definition of cause as motion? If so, there can be change or movement, without any antecedent motion. I agree with the editor in holding that life is not a material object, or substance; Professor Huxley taught me that. But "self-motion" is a most perplexing conception, to say the least; and when it is ascribed to all matter, the world becomes utterly mysterious to me.

Two minor questions occur to my mind, though not strictly germane to the subject of my article. Nature, Dr. Carus tells us, has to meet many failures before realizing the relative perfection of some of her formations. Now a failure ordinarily means that one has an aim and fails to reach it. Are we to understand here that nature has an aim? If so, how does an aim differ from a purpose, which we are told has sense only when it is used in reference to a will? (3) Has nature then a will? If so, how does "monism" differ from theism? I cannot see how such a theory as "failure" is possible in the monist's universe; such a conception would seem to be purely anthropomorphic and to relate only to human ideals. Is it not the object of "monism" to get rid of dualism? But what is idealism, along with the admission of failures, but a kind of dualism? The "monist," it seems to me, would have no idea of the perfect save that which is, (4) though what is perfect at one time may not be perfect at another; anything else would seem to be setting up one's own notions against the order of the universe.

The second difficulty relates to the origin of physiological and other organs. Every organ, it is said, has been produced by its own function, and a function is the *consequence* of a "want." Protoplasm is spoken of as having "a kind of hunger." This may be so. In former days, when anthropomorphism ruled in science (or what passed as science at the time), natural phenomena were often explained by supposing there were causes analogous to sensations and experiences of man's own. The facts of attraction and repulsion were sometimes explained as coming from love and hate, and so on. We are accustomed now-a-days to give the name of mythology to such explanations. It may be we are in the wrong. But is "monism" to conduct us back to mythology again? How does the view that nature is alive and all matter "*besetzt*" differ essentially from the primitive animism, according to which all events happened according to the wants, hungers, and wills of beings like ourselves, and from which the ordinary idea of God is itself a development? I am far from meaning that "monism" would ever give rise to a mythology parallel to the Greek or the Christian, but how does it differ in principle from the animism in which old-time mythology had its roots.

In conclusion, I return to the real question of this paper: How far does science give us true causes? (5) Every one must admit it

\* Lord Lyttleton.

gives us all the causes we know. But does it give us all *there are*? I ask simply; I do not assume to answer. Least of all, have I any other desire than to understand the "monistic" position more fully.

## EDITORIAL REMARKS.

(1) Existence has no cause; existence exists, it is always self-existent. But all things, in their particular forms as such special things, have their causes, and no thing, as such, is without cause.

(2) The order of the Universe can be explained, but not existence itself. Existence need not be explained; it is a fact that must be stated and verified by experience.

(3) Nature has a certain aim: which means that its development tends to a certain definite direction according to the general cosmical order. Nature's aim cannot be called purpose, because a purpose is an aim pursued with consciousness by a will.

(4) Nature knows the *is* only. "Perfection" is an ideal, and as such it is a most important reality which influences the direction of human development; the ideal is the ethical "ought," which is, as Mr. Hegeler has tersely expressed it in a conversation upon the subject, the "*is to be*."

(5) Science gives us no causes; science, after ascertaining and stating the causes of phenomena, propounds natural laws which serve as *raison d'être* to comprehend phenomena. There are many phenomena of nature yet unexplained; but there is no phenomenon of which we can say that it is unexplainable.

## IS NATURE ALIVE?

IN REPLY TO MR. SALTER.

Mr. Salter asks: "Is Monism to conduct us back to Mythology again? \* \* \* If *causa sui* is a self-contradictory conception what can be said for 'self-motion' or 'spontaneity.' \* \* \* Can a body move itself? If so, what becomes of the definition of cause as motion? If so, there can be change or movement without any antecedent motion."

Monism, it is hoped, will not lead us back to Mythology, but will free us from its trammels by explaining it. Mythology, like other errors and beliefs in ghosts and supernatural entities, leads a tough life because there is some truth in it. The Indian looks upon nature as alive; the things that he sees and hears about him, the rustling leaves of the trees, the babbling brook, the passing cloud, and the silently towering rock, all are supposed to possess life like himself. Is he not a part of nature and should not the rest of nature be similar to him? What is the origin of life, if nature is dead?

Science, no doubt, has put an end to anthropomorphic conceptions. We no longer think that thunder is the work of a thunderer and that the wind is a restless spirit-hunter who chases the clouds. But the connection between man and nature has by no means been severed. It has, rather, become more intimate than it ever had been conceived by our ancestors. The evolution theory has proven the kinship between man and animals, and later researches about the origin of life arrive at the result that life has no origin: it must be eternal. The barrier between organic and inorganic nature is broken down, and life is recognized as a fundamental property of matter.

This view of the origin, or rather the non-origin and eternity of life, has been propounded, in England, by Mr. Huxley, and in Germany by W. Preyer, chiefly. The theory of the immanence of life in nature, as we may call it, is the result of purely empirical investigations. *Omne vivum ex vivo* was the essence of the biological investigations of the seventeenth century. But since the microscope has introduced us into the mysteries of protoplasm, our modern biologists have corrected the sentence into: *No living substance but from living substance*. There is no life but from life. The hypothesis of *generatio æquivoca*, of a spontaneous generation of life, of heterogenesis, and of a vivification of dead matter, as it had been supposed to take place in putrid substances, are counted now among the many superstitions of science, which are done with forever.

Our view of life itself has been changed at the same time. Life had been considered as a substance. What life-substance and

mind-substance might be like, were even not long ago objects of serious discussions. Even so modern a thinker as Mr. Spencer discusses the subject and arrives at the conclusion, so characteristic of his agnosticism, that it is a problem too profound for solution.\*

The view of life as being a substance yielded to the belief in a life principle (a kind of life energy), a view which is generally called vitalism. Vitalism, however, had also to be abandoned, and life is now recognized as a phenomenon of nature which depends on the presence of neither a special life-substance nor a life-principle. The phenomenon of life appears, as all other phenomena, if its conditions are present; it disappears, if its conditions are absent, and so far as science now goes, life has never been discovered but as a continuation from, or a development of, prior life.

The new view of the immanence of life in nature makes it necessary to distinguish between life in a broader, and life in a narrower, sense. Life in a narrower sense appears in the two organic kingdoms as vegetable life and animal life. The lowest kind of organic life exhibits irritability, and sensitiveness to light and warmth, etc. In the animal kingdom, sensitiveness develops sensation and consciousness. Life in the narrower sense, or organic life, in all its wonderful forms, has been developed by imperceptible degrees from life in the broader sense. Life in the broader and broadest sense will be found to be more and more uniform, while the highest branches of organic life admit of an almost infinite variety of form. The most primitive and at the same time most intense life must have existed on earth when our planet was still in its gaseous state. The death of this igneous form of life was the birth of the organic form of life.

For the purpose of defining the conception of life in the broader sense in its most essential feature, we cannot better characterize it than as self-motion, or spontaneity.

By self-motion, or spontaneity, we do *not* mean a motion to which there is no prior motion and which thus originates out of itself without a cause, or without another motion. Self-motion is used in distinction from a movement by push. Suppose, for instance, that the sun in its progress happens to cross the path of a comet, and, being the greater mass, attracts the lonely wanderer. If the attraction of the comet is due to a quality of the comet and of the sun, it is self-motion or spontaneous motion; but if both bodies are inert, it is due merely to the push of ether. In either case, whether the motion is spontaneous, *i. e.*, due to an intrinsic quality, or whether it is transmitted by a pressure from without, it could never originate without a cause. A motion of some kind, a change of position, must have happened. This change of position, in our instance the progress of the sun, would be the cause of the comet's self-motion.

One of the several objections against the ether-hypothesis as presented by Le Sage, is that it considers matter as dead and the world as a lifeless mechanism which must be set in motion by pressure from the outside. It was invented in order to account for motion in inanimate masses. Le Sage thought to get rid of the idea of self-motion and of an animated universe. He attempted to explain the Universe mechanically—an error in his time very excusable—and did not see that a mechanical explanation is impossible.

Mechanics is the science of motion. Every motion can be expressed in terms of time and space. Every motion is determined by its path and velocity. Accordingly it can be computed with the assistance of mathematical and arithmetical rules. There is no motion, neither that of live organisms nor that of dead machines, which does not comply with mechanics: self-motion, as well as the transmitted motion of merely mechanical movements, is determined by the law of mechanics. But this truism is not iden-

\* Mr. Spencer sums up his opinion in these words: "In brief, a thing cannot at the same instant be both subject and object of thought; and yet the substance of mind must be this before it can be known."

tical with an explanation of life from mechanical laws. Mechanics is not the *scientia ultima*, the ultimate *raison d'être* of natural phenomena. It only represents one aspect of natural phenomena. A mechanical explanation of the world would be possible, if the world consisted of purely mechanical phenomena. But purely mechanical phenomena do not even exist.\* Mechanics is an abstract science that investigates into the law of motion in its abstractness.

The indisputable truth that the universe with its life and motion cannot be mechanically explained has induced some philosophers to speak of hypermechanical processes in nature as if motions existed that could not be computed by mechanics. The word hypermechanical conveys the idea that it has to do with mechanics of a higher degree where the usual laws of motion are annihilated and some incomprehensible mysticism takes their place to account for certain peculiar phenomena of motion.

The problem under discussion will find further elucidation by a comparison of mechanics with other formal sciences—especially logic. Logic is also an abstract science. It treats of formal thought abstractly. Thought has to comply, and does comply, with the laws of logic. Of course thought does not always comply with the rules of logic; it drops often into illogical fallacies. But that is no exception from the rule that logic expresses the law of formal thought abstractly; for every error in real thought, every wrong conception in our mind, even every material disorder in our brains, will lead to wrong conclusions which appear to sound thinkers as illogical. This exception is no other than that of a machine which is out of order so that its mechanical result, in full accordance with the laws of mechanics, is not what it ought to be.

Great philosophers have tried to understand the universe logically. They were confident of constructing a universe out of pure thought and of deducing existence (or being) from reason. This kind of philosophy, obviously erroneous and yet so natural in its time, is called ontology (from *ὄν, οὐσία, ὄν, ὄντος*, being), because real being or reality was derived from abstract being. The most famous and perhaps most consistent, and grandest system of ontology is that of Hegel, who belongs to the generation following the era of Kant. Yet so little was Kant understood at the time, that Hegel grew prominent and more renowned than Kant ever had been during his life. But the spirit of Kantian criticism grew also; it grew like an oak, slowly but strongly, and one sentence in his "Critique of Pure Reason" so shook the system of Hegelian ontology that it tumbled together like a house of cards. This sentence of Kant's declares that "all knowledge *a priori* is empty and cannot give information about things."

Knowledge *a priori* Kant calls in other places formal or transcendental knowledge, and transcendental in Kant's terminology does not denote anything transcendent or mysterious. Transcendental logic, or pure logic, treats of the form of thought only, and abstracts form from the contents of thought altogether. Therefore, pure reason useful as it is for its purpose if employed for criticism and as a regulator of correct thinking, is useless for the purpose of ontology.

In opposition to the futile method of the ontologist, those thinkers who instinctively felt that logic could not answer the ultimate question about the existence of the world—such men as understood the depth of the problem, yet were unable to solve it—denounced reason as altogether insufficient and even erroneous. They spoke of a superior and divine reason in opposition to our weak human reason, as if reasons of different kind could exist.

The idea of hyper-mechanical motions is shaped after the pattern of such a supernatural reason, which is conceived to stand in

contradiction to human reason. Hyper-mechanical is just as self-contradictory as hyper-logical, hyper-arithmetic, or hyper-mathematical. All attempts to construe Riemann's ingenious idea of a curved space into a hyper-mathematical space-conception are vagaries and will be recognized as such by every one who is familiar with Grassmann's *Ausdehnungslehre*, which will receive a closer attention in a later number of THE OPEN COURT.

Monism, as editorially represented in THE OPEN COURT, keeps equally aloof from ontology, which is an overvaluation of reason, and from mysticism, which is an undervaluation of reason. The universe, in its existence as a living whole, is accepted as a fact, but the order and form of the universe can be comprehended and investigated.

By the form, for instance, of planets, we understand their shape as globes (or rather as spheroids); by the form of their motions we understand their paths, which are conic sections. We cannot comprehend why planets materially exist; their material existence, that their mass exists at all, is a fact; but their existence as planets, why they exist in the shape of spheroids, and why they travel in paths of conic sections can very well be comprehended under the supposition that their masses are in motion and possess a certain quality, which we call gravity.

Intelligibility involves regularity of form, or order. Chaos is unintelligible, but order can be comprehended. Let us bear this truth in mind when we attempt to solve the mystery of life. Science has solved many problems of psychology, physiology, and biology, but the solutions have always been such as account for certain forms of life. The evolution theory, so far as it goes, explains how the human form has developed from the most simple forms of protoplasm. Every living particle of man's body is protoplasm of a certain form; and science, when showing how this form must have developed, has solved the problem of the Descent of Man.

Now, it is contended that while the problem of the Descent of Man may have been solved, the problem of Life remains unsolved, because the origin of protoplasm is not yet demonstrated.

This is true; but it must be remarked that the problem to be solved is rather the origin of the form of protoplasm than the origin of life. The spontaneity of living substance is found in the kingdom of inorganic nature also. A base and an acid rush toward each other and combine in the form of a salt. As soon as we know what the molecular forms of bases and acids look like, we may be able to comprehend why they combine into substances of a new form, which have the properties of salts. If the science of molecular chemistry (which does not yet exist) should succeed in a discovery of this kind, the problem of the formation of salt crystals would be solved and the affinity of bases and acids would have found its explanation. But the problem of why the atoms of a certain shape fit to atoms of another shape, is different from the other problem: Why do the atoms rush towards each other at all?

Mr. Salter asks: "How can a body move itself?" The fact is, the body moves; and our problem is: Does the body move because it possesses a certain quality which is intrinsic in the body, or does it move because it is pushed by a pressure from without? The problem is by no means solved, but there is no reason why in time it should not be solvable. Our opinion is, that the atoms, as well as the masses of matter, possess spontaneity or the property of self-motion, which is akin to what in the higher forms of natural phenomena in the organic kingdom is called life. Self-motion is, therefore, life in a broader sense, and the phenomena which are exhibited in protoplasm must ultimately find their explanation from its form as a special and complicated instance of the simpler self-motions of inorganic substances.

Our chief objection to the mechanical explanation of life by *vis a tergo* is, that it leaves the problem for whose solution it is invented, untouched. If all the atoms of our body acted only be-

\* E. Mach, "Die Mechanik in ihrer Entwicklung," p. 457: "Rein mechanische Vorgänge gibt es nicht." "Rein mechanische Vorgänge sind also Abstraktionen, die absichtlich oder notgedrungen zum Zweck der leichteren Uebersicht vorgenommen werden."

cause they are set in motion from the outside by the pressure of ether, feeling as well as consciousness would remain unexplained. In that case the ether would possess spontaneity, and not the atoms. If it were so, the ether around us and within us might feel and become conscious, but not the atoms that build up our body, and the problem of the origin of psychical life would be obscured than ever. The origin of life would not be explained. On the contrary, by the assumption of dead and inert matter, life would become an impossibility.

The existence of life being a fact, and all supernatural or dualistic theories being inadmissible, we see no simpler solution of the problem than that of considering life in its broadest sense as an immanent property of matter. As such it remains what it ever has been, a fact ascertainable by experience. All explanations of the higher life in plants and animals will have to be confined to demonstrating how the higher forms of life originate from uniform life by showing the continuity of all life and the development from its simplest forms of spontaneous motion to its highest form known to us in the human will, which under circumstances will rise to heroic heights.

Monism, by accepting the idea that nature is alive, does not return to the old mythological standpoint. The characteristic feature of mythology is the fact that things are considered as animated *like ourselves*. The savage has sufficient power of generalization, as Mr. Spencer would express it, to see the similarity between ourselves and things; but he lacks the power of discrimination, which is indispensable to scientific investigation, to appreciate the difference between the babbling brook and a prattling girl; he hears in the murmur of the water the voice of a nymph. Monism, by explaining the truth that lies at the bottom of mythology, will afford the only means of liberating our minds from its errors, for mythological errors, it is true, are lurking everywhere in our conceptions and in our words. It would be impossible to clear language of mythological comparisons and similes without sweeping it entirely out of existence. If we tried to use language that is free from mythology, we would be obliged to invent a new Volapük—a language that has no historical development, that is not infected with the errors of the past, but will be understood nowhere.

Is it necessary to create such a language, a philosophical Volapük? Probably not. It is sufficient to show the traces of mythology and to explain their origin. We still speak of sunrise and yet we know it is the earth by its rotation that causes the appearance of the sun on special parts of its surface. We know it, and every child now knows it, without taking offense at the inadequacy of the expression.

We make bold to say there is no word in any language which is not from some point of view an inadequate, or a mythological, or a dualistic expression. If we employ the term life in its broadest sense as spontaneity or self-motion, we are conscious of using a mythological expression. The same is true of such words as affinity in Chemistry, attraction and repulsion in Physics, of the sexes in Botany and in innumerable other cases. To speak of failures in the empire of nature where there is neither will nor consciousness is a mythological expression also which is quite allowable if it cannot be misunderstood.

Anthropomorphism is not only allowable and justifiable, it is even indispensable to a proper comprehension of phenomena external to us. Man is a part of nature and man's whole existence must be understood as a special form and combination of certain natural phenomena. A direct knowledge of nature is given to us in our consciousness only; and this consciousness must be used in order to interpret the other phenomena of nature. Accordingly, the natural development of human comprehension will lead us through anthropomorphism, of which science will free us step by step, from which, however, we never shall nor can be severed entirely; for there is a truth in anthropomorphism which is fully explained by

the doctrine of monism that Nature is one great and living whole of which man is a part—such a part as contains in its form the quintessence of nature's life.

P. C.

## COMMENTS ON THE EDITOR'S VIEW OF CAUSALITY.

BY DR. EDWARD BROOKS, OF PHILADELPHIA.

WITH EDITORIAL REMARKS.

I have read with great interest the editor's clear and able discussion of the problem of causality, and while agreeing with many of his statements, there are a few points to which my mind does not at present assent. I take the liberty of calling attention to a few of his statements, with the desire of a fuller elucidation of the subject.

1. In No. 55 you say "effect is a new arrangement of things," but "never an object, or a thing;" that "the statue, as a thing, is not the effect;" that "the effect is the special form of the wood, clay, stone, or bronze." Now, it seems to me that by *statue* we always mean the "special form" of the material, and not the material itself. I ask, who carved this marble statue? or, who cast this bronze statue? and I mean—not who made the marble, or the bronze—but who shaped them into the form which we call a statue. No one would for a moment suppose I meant by my inquiry who made the material out of which the statue was formed. The statue, it thus seems to me, is properly and necessarily to be regarded as the effect; and when I inquire who made the statue, I am inquiring for a cause of which the statue is the effect.

[The statue, as commonly understood, comprises both the form and the material of which it is made. In the main point we agree fully with Dr. Brooks: The statue, so far as it is the effect of the sculptor's labor, is the *form* of the statue. In this instance the distinction is obvious enough; but it has to be pointed out in simple instances, in order to show that the same also holds good in other more complicated instances.—Ed.]

2. Again you say: "The sculptor is not the cause;" but "the sculptor's labor is the cause." Well, what or who is the cause of the sculptor's labor? If you pass backward along the chain of causation towards the origin, do you not find the sculptor a link in the chain; and, as he is the source of the labor, is he not as much of a cause as the labor of the sculptor? If there had been no sculptor there could have been no "sculptor's labor," and thus no statue as an effect. It seems to be, therefore, that it is entirely proper to speak of the sculptor as the cause of the statue. He produces the statue; it is the product of his brain and hands; and he is, therefore, the source or cause of it.

In your example of a loaded gun and the deer, you say "the pull on the trigger is the cause." But the pull on the trigger is an effect caused by a volition of the mind. This volition of the mind is an effect produced by the mind; so that the most prominent link in the chain of causes is still found to be the mind, or in other words, the person. This is not only philosophy, but the basis of law, for it is the person and not the "pulling of the trigger" that would be held responsible for the violation of law if it were unlawful to kill a deer.

It seems to me that any course of reasoning that tends to disprove the above conclusion would tend to prove that the "pulling of the trigger" was not the cause of the killing of the deer. Thus the pulling of the trigger was followed by the fall of the hammer, this by the explosion of the cap, this by a spark that ignited the powder, this by the explosion of the powder, and this by the motion of the bullet; now here are several links in the chain, and we inquire which of these is the cause of the killing of the deer—the motion of the bullet, or the explosion of the powder, or the spark from the cap, or the explosion of the cap, or the blow of the hammer, or the pulling of the trigger? Is it not more reasonable to say that the man who pulled the trigger shot the deer and was the cause of the killing of the deer?

[Here it appears how necessary a disjunction between form and substance is. Causation being the progress of motion, a cause must always be a motion or a change of place, an alteration of some kind in a configuration of certain circumstances; but never a thing or a person, never a substantial entity. Certainly, if there had been no trigger there could not have been a pull on the trigger. Nevertheless, the trigger is not the cause, but the pull on the trigger. The cause of volition of the mind is not the mind itself; but, as a rule, a desire. The causes that move the mind to volition are properly called motives. The sculptor is as little the cause of his work as the trigger can be called the cause of the pull at the trigger. Dr. Brooks maintains that the sculptor forms a link in the chain of causation towards the origin. Let us see. The cause of the manual labor is the mental labor of the sculptor's imagination, including the work of modeling. And the cause of the sculptor's mental activity (which obviously consists in motions also) is perhaps an order from a patron or a demand of some kind among the public at large. And this demand, which is again a motion of a peculiar kind, is perhaps the effect of a certain idea which has become popular for some reason or other. Such ideas as excite popular interest are called "movements." Thus we can trace causation back *ad infinitum*. How far it should be traced depends upon the circumstances of each case; but always we shall find the causes to be motions of some kind. Without motion no change, and without change no causation.]

[Popular usage calls natural laws also the causes of phenomena for which they serve as explanations. We object to this usage because causes, as defined in No. 55, and natural laws are radically different things. If both are called by one and the same term, we shall understand neither the one nor the other, and causality will remain a profound mystery.]

[The person committing a crime is not a cause. The cause of a criminal's act is his motive. But, of course, the criminal is answerable for his deed. The motive is nothing but a transient phenomenon of nature (a psychological phenomenon), and so are all causes; all causes are transient natural phenomena involving some change of place.]

[In every chain of causation, we can trace a progress of motion. Every prior event is the cause of the subsequent events. Which two events should be selected and named "Cause and Effect" depends upon the proper tact of the observer. That which should be designated as cause and effect must be equal in importance, or must stand in a certain relation; e. g., 'intention' and 'end attained.' It depends, of course, on the purpose for which the statement, or an enquiry, is made.]

[We take the liberty to omit Nos. 3 and 4 of Dr. Brooks's comments, since they have reference to the expression "being suspended" in No. 58, which, in the mean time, had been corrected in No. 59, on page 1256.—Ep.]

5. "Gravity," you say, "is an abstract conception."—Is it not more than this? Is it not an existence independent of the mind concerning it? We have a conception of force; are there not forces which exist independent of our conception of them? Would not some force, which we call gravity, exist even if there were no mind to conceive it?

[Gravity is an abstract conception, and as such it has been abstracted from reality. Gravity represents a quality of real things, independent of our conception, as has been stated in No. 58, pp. 1240-1241. Gravity, though it is in so far real, is not a cause, not a transient phenomenon, but an always existing quality of nature; while gravitation is a natural law formulated to account for the stone's fall and all other phenomena of gravity.—Ep.]

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXIV—Continued.

The guests had left, and Ilse was sitting alone in her room. What had she done? Become the confidant of a man implicated in a bloody deed, the secret adviser of a lawless action. She, a woman, was the confederate of a strange man; she, the helpmate of one who should be the guardian of the laws, had become the abettor of a crime. What dark spirit had infatuated her when she confidentially held counsel with the stranger in whispers on a subject which she could not venture to confess to her husband? No!—he who had drawn her into this was not a stranger. She had from her childhood heard of him with deep interest; he was the future ruler of her country, and would be there master of life and death. From the time she first knew him, so touching in his joyless youth and in the weak helplessness of his position, she had been tenderly solicitous about him; and from that day she had always found in him an amiable and pure mind. She was now trembling with anguish for him. She had driven him to his fate; she bore the guilt of an action that was considered unseemly for one in his position. If from her advice evil befell him—if the opponent of the poor, weak youth should kill him,—how could she bear it on her conscience?

She sprang up, and wrung her hands. Her husband called her, and she shuddered, for she felt herself guilty in his sight. Again she asked herself: "What bad spirit has distracted me? Am I no longer what I was? Ah me! I have not acted as becomes a Christian woman, nor as a careful wife who opens the shrine of her soul to one alone. Yet," she exclaimed, raising her head, proudly, "if he were again to stand before me, and again ask whether he should act as a man or as a coward, I would again and again say the same thing. May God forgive me!"

When Krüger entered the Prince's bedroom to undress him, the latter laconically charged him with a commission that greatly astonished the lackey. But as he saw himself thereby confirmed in his confidential position, he promised obedience and silence. He extinguished the lamp, and went to his post. An hour after, he introduced the student, who had been brought by Gabriel through a back-door, into the bedroom of the Prince. There a conversation took place in a low tone, the consequence of which was that the student hastened from the house in great excitement, and commissioned Gabriel, who was waiting, to order a cab to be ready at an early hour in the morning near the corner of the next street.

A serious company, the flower of the different corps and associations, tried fellows of daring aspect,

\* Translation copyrighted.

were assembled at early dawn in the hall of a tavern some distance from the town—an impressive sight for every student heart. On this day most of the sanguinary agreements of the memorable evening were to be settled in their proper order. The first matter in hand concerned the academic honor of the Hereditary Prince. The combatants were drawn up, dressed in their fencing attire; each one stood, with his seconds and umpires, in a corner of the room; the physician—it was the old Teuton of the fiddle—had prepared his apparatus in a corner, and looked with grim satisfaction on his impending work, which promised him new and instructive cases. But the Arminians were unappeasable: once more their seconds addressed themselves to the referees, and complained that the Prince was not there, at least, to acknowledge his representative by his presence. They therefore demanded that the impending combat should not be reckoned for him, but accounted as a personal struggle between the two students, who had frequently come athwart each other in various delicate relations. As the Markomanns had not clear consciences, having equivocally contrived to evade the question, they now proposed that the Prince should subsequently meet the seconds at some place to be agreed upon, where the customary reconciliation should take place.

This was discussed with much bitterness, but briefly, as the hour demanded. Suddenly the freshman, a young Arminian, who kept watch outside, knocked twice at the door. All stood motionless. But the seconds gathered the swords together and threw them into a dark closet, while our student, who, as backer for his comrade, was binding silk about wrist and arm, sprang quickly to the door and opened it. A slight figure in a cloak and felt hat entered. It was the Hereditary Prince. He removed his hat: his face looked paler than usual, but he spoke in a composed manner:

"I have come to you in secret; I beg that the gentlemen present will permit me to take upon myself the responsibility of giving satisfaction and will show me due consideration if I prove unpractised in any of the customary formalities; it is the first time that I try my skill."

There was a silence so profound that one could hear the slightest stir. All present felt that this was a manly act. But Beppo, the Markomann, stood confounded, and began:

"Your Highness's presence now removes the only obstacle to our proceeding with the duel. I insist that the course determined upon be not reversed," and in a lower voice he added, "I beseech your Highness, not to do what is so plainly unnecessary; it will cast upon us all a responsibility that we dare not assume."

The Prince answered firmly: "You have fulfilled

your promise; I am as grateful for the will as for the deed. But I am resolute." He took off his coat, and said: "Put the bandages on."

The second of the Arminian turned towards the umpire, saying, "I beg to inform our opponent that not a moment is to be lost; we are not here to exchange civilities; if the Prince wishes to have satisfaction himself, we are ready."

The Markomanns prepared the Prince, and one must acknowledge that the brave fellows did it with as anxious solicitude as if they had in fact been warriors of the race whose name they bore, and were preparing their young king's son for deadly single combat.

The Prince stepped up to the mark; the weapon trembled in the hand of his second, a scarred veteran, as he took his position beside him. "Ready!"—"Go!" The blades whistled in the air. The Prince did not behave badly; a long habit of cautious self-command stood him in good stead; he avoided exposing himself dangerously; and his second drew upon himself a sharp warning from the umpire for inconsiderately exposing his own person within reach of the enemy's blade. The Arminian was far superior in strength and skill, but he afterwards acknowledged to his intimate friends that it had quite disconcerted him to see the princely scion within reach of his broadsword. After the fourth pass, blood streamed from Ulf's broad cheek on to his shirt. His second demanded the continuation of the fight, but the umpire declared the quarrel ended. As the Prince stood still in his place the sword fell from his hand, and there was a slight tremulous motion in his fingers; but he smiled, and there was a pleased expression on his face. In one short quarter of an hour a boy had attained the self-reliance of a man. Before the Prince turned to his antagonist he embraced the Markomann, and said: "Now I can thank you from my heart." The umpire led him to his opponent, who was standing ill-humoredly before the Doctor, but yet could not suppress a smile that gave him some pain, and both shook hands. Then the Arminians approached to greet the Prince, while the umpire called out "Second event."

But the Prince, who had resumed his mantle, went to the director of the duels, and began: "I cannot go away without making a great request. I was, unfortunately, the cause of the painful occurrence that has occasioned this discord among the students. I well know that I have no right here to express any wish, but it would be a pleasant recollection forever for me if I could bring about peace and reconciliation."

At this moment the Prince might have made any demand upon his Markomanns, and even the Arminians were impressed by the extraordinary event. A murmur of approbation passed through the room, and

the umpire exclaimed in a loud voice: "The Prince has spoken well." The gloomy looks of some individuals were disregarded; the seconds and seniors held a consultation upon the spot, and the result was that the impending challenges were amicably settled, and a general reconciliation brought about.

The Prince, surrounded by the Markomanns, left the house and jumped into the carriage awaiting him. Krüger opened the bed-room door to him.

The Chamberlain had been much surprised this morning at the long repose of his young master; but when he came to breakfast he found his Prince sitting comfortably at the table.

After Krüger had gone away, the Prince began: "The duel has been settled, Weidegg. I fought it out myself." The Chamberlain stood up, horrified. "I tell you it because it could not long be kept a secret. I hope that the quarrel among the students will be settled by it. Do not say anything against it, nor be annoyed at the matter. I have done what I considered to be right, or, at all events, what was least wrong, and am happier than I have been for a long time."

The Markomanns had begged of all present to give their word that the events of the morning should not be spoken of, and one may assume that every one kept his promise. Nevertheless, the news flew quick as lightning through the University and city, that the Prince himself had composed the quarrel by his valiant and manly conduct. The Chamberlain perceived from the indications of pleasure from the Markomanns, and the friendly greetings which his young master received in the street, and still more from the altered demeanor of the Prince himself, that the secret duel had had a good result, and this reconciled him a little to the vexatious occurrence.

When the Prince some time after visited the Rector's house, he was led into the latter's study, and Werner greeted him, smiling. "I was obliged to inform the government of what had lately taken place, and to add, according to the unanimous sentiment of the students summoned to appear before me, that your Highness had, by your interposition, contributed essentially to the restoration of peace. It has become my duty to express to you the warm acknowledgment of the academical authorities. I venture to give expression to my own wish, that all that your Highness has gone through on this occasion may ever leave an agreeable and also profitable recollection."

As the Prince bowed to Ilse, he said, in a low voice: "All has gone off well, I thank you." Ilse looked proudly at her young Prince. Yet she had not recovered from the fearful anxiety of the previous day, and she was more reserved with him than usual.

## CHAPTER XXI.

## CHAOS.

Spring smiled cheerfully on the country, the flowering shrubs and the beds in the garden combined their colors brilliantly; this year, starlings actually sang in Mr. Hahn's cages, and ranunculi and other wild flowers in the meadow in front of Mr. Hummel's garden rejoiced in the moist warmth. It was a pleasant time for our academical citizens; the quarrels of the winter were settled, the beadles put on their night-caps at ten o'clock, and the lectures of the Professors went on smoothly and pleasantly.

The Rector also enjoyed the repose, and he needed it, for Ilse saw with anxiety that his cheeks were thinner, and that in the evening a lassitude came over him that formerly he had not known.

"He ought to rest from his work a few months," advised the physician; that will lend him new life and strength for years to come; every man of studious habits requires such relaxation two or three times during his life; traveling would be the best thing."

Felix laughed, but his wife kept this counsel faithfully in mind, and endeavored, meanwhile, as often as possible, to draw her husband from his books into the air. She put her arm within his and took him into the wood and green meadows; she pointed out to him the butterflies that fluttered over the wild flowers, and the flights of birds that enjoyed themselves in the warm sun-light.

"Now is the time for that restlessness of which you once told me. Have you not noticed it?"

"Yes," said the Professor, "and if you will go with me, we will, at least in fancy, travel together into foreign parts."

"Will you take me with you?" exclaimed Ilse, delighted. "I am like the woodchuck: I only know the hole from which my master brought me, and the cover of the cage in which I am fed. If I could have my wish, I should like to see snow-capped peaks rising high above the clouds, and abysses of immeasurable depths. But from the mountains I would descend to olive-trees and oranges. For years I have heard of the men who have lived there, and have seen how your heart leaps for joy whenever you speak of the blue ocean and of the grandeur of the old cities. I would gladly see all this, and hear you talk and feel the pleasure which you would have in revisiting the scenes so dear to you."

"Very well," said the Professor; "to the Alps and then to Naples; but in passing I must work a few weeks at Florence upon Tacitus."

"Ah!" thought Ilse, "there is the manuscript again."

They were sitting under a large oak, one of the giants of the Middle Ages, that towered above the new

generation of trees in the forest, as the cupola of St. Peter's does above the towers and roofs of the Holy City.

When they came out from the copse into the open space, they saw, amidst the flowers in the meadow, the livery of a lackey, and then perceived the Prince and his attendant, together with a proprietor from a neighboring village. The gentleman approached and greeted them.

"We have a design upon some hours of your leisure," called out the Chamberlain to the Professor, and the Prince began:

"I wish to invite some of the ladies and gentlemen of the University to an entertainment in the open air, as I cannot have the pleasure of receiving them at a house of my own. It will be a small party, and as rural as possible; we thought of this spot, as your wife had often extolled it. I would be grateful for your assistance and advice as to the arrangements."

"If your Highness wishes to please the ladies, you should also invite the children. If it is at the same time a children's party, your Highness may be assured that it will leave a pleasant impression."

This was agreed to. Dainty invitations were sent to the Rector and Deans, and the Professors with whom the Prince was personally acquainted, and their families, to an entertainment in the open air. The idea was approved by great and small, and gave rise to pleasant anticipations among the acquaintances of the Rector's wife.

Laura had received an invitation, and her pleasure was great. But when in the evening it appeared that the Doctor was not invited, she was quite put out.

"I do not mean to be his advocate," said she, to Ilse, "but he is precisely in my position; and if I am asked on your account, he ought to be for the sake of your husband. Their having neglected to do this is want of tact, or something worse; and, as he is not asked, I am determined not to go; for, let Fritz Hahn be what he will, he has not deserved a slight from these people."

In vain did Ilse try to explain to her that the Doctor had not visited the Prince, from whom the invitations came. Laura remained obstinate, and replied:

"You are an eloquent defender of your Prince, and more acquainted with the customs of great people than I had supposed. But when the picnic-day comes I shall feign illness, you may rely on that. If my friend over the way is not invited I shall not go. But do not tell the Doctor, lest little Fritz should fancy I do it for love of him; it is not friendship for him, but displeasure at the Court people."

One Sunday there drew up in the neighborhood of the great oak, first a large van with Krüger and a cook, then the Prince's equipages bringing the ladies

and gentlemen, and an omnibus adorned with garlands and wreaths brought the children of the different families. A tent had been set up in the meadow, and a little apart, concealed in the copse, a wooden hut was erected as a temporary kitchen; a band of music was stationed in the wood and welcomed the parties as they arrived. The Prince and his Chamberlain received their guests near the wood, and conducted them to the centre of the picnic-grounds, where a prodigious work of the highest confectionery art formed the lighthouse, in the neighborhood of which they all dropped anchor. Soon there was a clatter of cups, the unavoidable preparation for thorough German festivity. In the beginning the company were solemn; there was something unusual in the arrangement of the fête which occasioned reflection. But when Raschke, raising the flaps of his coat, seated himself on the grass, and the other gentlemen followed his example and lit the cigars which were presented to them, the meadow assumed a bucolic appearance. Even the Rector sat on the turf with his legs crossed in Turkish fashion; near him the Consistorial Councillor on a chair; and somewhat further off, on the trunk of a shattered tree, the still hostile Struvelius, with his bristling hair and silent manner, like the sorrowful spirit of an old willow. Apart from them, but enthroned on a high ant-hill, over which he had spread his pocket-handkerchief, sat Master Knips; he held his slouch hat respectfully under his arm, and rose whenever the Prince approached. Meanwhile the latter exerted himself to entertain the ladies, with whom he had been a favorite since the occurrence of last winter, and to-day he completely gained the hearts of both mothers and daughters. Ilse and he worked together with a mutual understanding; Ilse, elevated by the thought that people were pleased with her Prince, and he happy at heart that he had some work in common with the Rector's wife.

Never yet had he felt on such an intimate footing with her as he did to-day. He looked only at her, he thought only of her. Amid the buzz of conversation, amid the sound of the music, he listened to every word that fell from her lips. Whenever he approached her he felt a glow of transport. In plucking a leaf from a tree, the lace of her sleeve passed over his face, and the touch of the delicate texture brought the color into his cheeks. Her hand rested a moment on his as she offered him a ladybird, and the slight pressure made his heart beat fast.

*(To be continued.)*

Still in the paths of honor persevere  
And not from past nor present ills despair;  
For blessings ever wait on virtuous deeds,  
And, though a late, a sure reward succeeds.

## BOOK REVIEWS.

LOUISA MAY ALCOTT, "THE CHILDREN'S FRIEND." By Ednah D. Cheney. Illustrated by Lisbeth B. Comins. Boston: L. Frang & Co.

The recent death of the author of "Little Women" has been a great loss to juvenile literature, and a short biography of Miss Alcott's life, with extracts from her works illustrating her life, will be a welcome gift to our children and perhaps not less so to the many men and women whose memories dwell with love in Miss Alcott's beautiful stories. Mrs. Ednah D. Cheney, a life-long and intimate friend of the Alcott family, has prepared the sketch, in which she gives us the key to the wonderful success of Miss Alcott. The book is embellished with a handsome frontispiece and many pen illustrations by Miss L. B. Comins, representing views of two of Miss Alcott's homes and the family burial-spot in Concord, Mass. In addition to the simple but attractive story of her life we find an appendix of several poems, partly by, partly to Miss Alcott. The artistic form of appearance, worthy of the renowned house that has published the volume, is the more remarkable as the price is only one dollar.

O. C.

The point of special interest in *The Art Amateur* for October will be to many the notices of Prof. Morse's collection of Oriental Ceramics, which, we are glad to hear, has been purchased by a wealthy Boston lady, through whose public spirit and generosity we hope it will ultimately find its place where it belongs, in the Boston Art Museum. Reference is also made to his article in the September number of *Harper's Magazine*, which must be a very interesting one. The same subject is treated more fully in the talk with Tadamas Hayashi on Oriental Ceramics.

The various departments of the magazine are filled, as usual, with much that is entertaining and instructive, but we are sorry to find the subject of Biography of Contemporaneous Painters rather neglected of late. French writers are publishing admirable sketches of those artists whose names are becoming familiar to us by their work, and the *Amateur* could gratify a reasonable curiosity by reproducing or condensing them for American readers.

If the *Amateur* professes to give information in regard to art instruction in answer to serious queries, we think it should not dismiss the subject by saying the "Boston Art School is not known to us," and recommending the School of Fine Arts at the Conservatory, while making no mention of the "School of Art" at the Museum of Fine Arts, which has been pronounced one of the very best in the country, or of the Lowell School of Design, to say nothing of other schools which would seem well adapted to the questioner's purpose.

Would not a list of the well-established schools of art and design in the different cities, with some statement of the peculiar merits of each, be a very valuable source of information to those wishing to learn to draw thoroughly and well.

The Crayon Portrait Study, by L. Horowitz, is very good. Edward Moran's Marine Painting is very delicate in color and is free from the usual faults of printed landscapes. It has much poetic atmospheric effect. It well illustrates his long and valuable article on Marine Painting. The Night Hawk illustration is very bold and free, and the various studies in landscape are interesting and instructive. There are many good designs, but we do not like to see the head of the venerable "father of his country" hammered out on a plaque. Such misappropriations always remind us of the witty clergyman who refused to buy a moral pocket-handkerchief, saying: "The Lord's prayer isn't a thing to be sneezed at."

E. D. C.

## NOTES.

In answer to a question of X. F. P. O., of Columbia, Mo., we will state that the subject of Monism is treated in No. 8, "Monism,

Dualism and Agnosticism"; No. 24, "Monism and Religion"; No. 25, "What the Monistic Religion is to Me"; No. 27, "Goethe's Monism"; No. 30, "Superstition in Religion and Science"; No. 33, "Monism and Philology"; No. 35, "Idealism, Realism and Monism"; No. 40, "The Nature of Mind"; No. 47, "The Oneness of Man and Nature"; Nos. 53, 54 and 55, "Monism and Religion. A Rejoinder, With Editorial Remarks"; No. 56, "Religion and Science. A Résumé."

## PAMPHLETS ON LIVING QUESTIONS.

- Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents; 10 copies, 50 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents; 10 copies, 50 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents; 10 copies, 25 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents; 10 copies, 25 cents.  
The God of Science. By Francis Ellingwood Abbot. Price, 10 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents; 10 copies, 25 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents; 10 copies, 50 cents; 100 copies, \$3.00.  
The Bible and Science. By John Weiss. Price, 10 cents.  
The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents; 10 copies, 25 cents.  
Evolution and Religion. By John Fiske. Price, 5 cents; 10 copies, 25 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.  
Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.  
An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents; 10 copies, 25 cents.  
Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourne and Prof. Asa Gray. Price, 5 cents; 10 copies, 25 cents; 100 copies, \$1.00.  
Messianic Expectations. By Rabbi Solomon Schidder. I. Introductory, 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents; ten sets for \$1.00.  
The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents; 10 copies, 25 cents.  
The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Jones. Price, 10 cents.  
A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## The SAFE SIDE

A THEISTIC REFUTATION OF THE  
DIVINITY OF CHRIST

BY  
RICHARD M. MITCHELL.

IT IS SAFE TO KNOW THE TRUTH.

Price, Cloth, \$1.50 postpaid.

For Sale by CHARLES H. KERR & CO.,  
CHICAGO.

#### CONTENTS.

Chapter I.—Guiding Nature of the Mental Faculties.
Chapter II.—Natural Depravity.
Chapter III.—The Reasoning and Religious Faculties.
Chapter IV.—The Christian Religion.
Chapter V.—The Witnesses and Imagination.
Chapter VI.—John the Baptist.
Chapter VII.—Cause of the Crucifixion.
Chapter VIII.—The Teachings of Christ.
Chapter IX.—Josephus.
Chapter X.—Josephus and Jesus of Tiberias.
Chapter XI.—St. Paul.
Chapter XII.—St. Paul and the Ascension.
Chapter XIII.—Faith.
Chapter XIV.—The Fourth Gospel.
Chapter XV.—The Question as Met by Modern Authors.
Chapter XVI.—Inertia of Ideas.
Chapter XVII.—Conversion.
Chapter XVIII.—Worldliness.
Chapter XIX.—The Safe Side.
Chapter XX.—Immortality.
Chapter XXI.—Supernatural Supervision.

### Three Introductory Lectures

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

159-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

#### PRESS NOTICES.

- "Full of novel thought."—*Chicago Herald.*
- "The subject is discussed with great clearness and simplicity."—*Book Chat.*
- "The absurdity of the theory is manifest."—*New York Science.*
- "The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic.*
- "Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon.*
- "The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times.*
- "The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star.*

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.  
"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its columns. For rates, etc., apply to

TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social, and economic questions.

P. O. DRAWER F.

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

PROF. E. D. COPE.

In Number 23 Professor E. D. Cope treats of "Evolution and Idealism," and finds in the evidence of evolution the refutation of the doctrine of Idealism. He concedes that much of what we consider the objective world is unreal and has no existence, except, as we perceive it, like the snakes, for instance, to the victim of *delirium tremens*; and he agrees that "the properties of matter" owe much of their character, and even their existence, to our senses, which give matter all its qualities, or, at least, modify and change them according to the number of our senses and their ability to perceive. Yet, for all that, he says: "If a given supposed object be purely a mental state on the part of the subject, a rational cause for the production of that state is wanting."

With great self-confidence, Professor Cope says: "Evolution gives the *coup de grace* to idealism of the consistent type. In the gradual unfolding of organic life it sees the two universal facts, subject and object. It sees them interact and influence each other," and further on he says: "It is equally competent for the materialist to deny the existence of mind as for the

idealist to deny the existence of matter. The materialist beholding the imperfection of the senses may pronounce them to be, one by one, incompetent witnesses, and declare them to be illusions. But the fact is, both exist, object and subject, matter and mind."

MONCURE D. CONWAY, on Agnosticism, in No. 47.

Mr. Moncure D. Conway, in reference to the philosophical exposure of Agnosticism in the editorial article of Nos. 43 and 44 of *THE OPEN COURT*, declares that the Unknowable cannot in the least concern the religious nature. Only weariness of wing can have brought free thinkers to seek rest on this raft. Religion does not follow abstract and vague gods, it follows Jesus, Buddha, Mary, who may be known and loved. On the truth and moral value of these great figures, man can base his life. Mr. Conway concludes with the remark that the ethical side of monism has not as yet been made clear. Nature seems predatory and cruelly impartial between good and evil. Adherents of error survive more comfortably and increase more extensively than the disciples of truth. May it not be more truly said that there is a moral law in man to which nature must conform in order to be elevated and transfigured to a nobler existence? Mr. Conway's critical remark if it were unanswerable from the standpoint of Monism would drive religion and philosophy back into the dualism and supernaturalism of former times. And truly the supernatural, if it is justifiable at all, must be recognized in the moral nature of man, unless man is proven to be a part of nature. The editor's answer to Mr. Conway's criticism, in the same number, expatiates on the Oneness of Man and Nature, thus showing that humanity, culture and civilization are but a higher stage of the natural, and that morality does not stand in contradiction to, but is an observing of and a conforming to the cosmoical order of the All.

ERNST MACH.

Ernst Mach (Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch) explains in his essay *Transformation and Adaptation in Scientific Thought*, (in Nos. 46 and 48), one of the most characteristic ideas of modern science—an idea that lies, so to speak, in the atmosphere. "Knowledge," he says, "is an expression of organic nature." The law of evolution, which is that of transformation and adaptation, applies to thoughts just as well as to individuals or any living organisms. A conflict between our customary train of thought and new events produces what is called the problem. By a subsequent adaptation of our thought to the enlarged field of observation the problem disappears and through this extension of our sphere of experience the growth of thought is possible. Thus the happiest ideas do not fall from heaven, they spring rather from notions already existing. From this standpoint the narrow conception of egotistic views disappears. "The person" is comparable to an indifferent and symbolical thread on which are strung the real pearls of life—the ideas that make up the changing content of consciousness. Humanity in its entirety is like a polyp plant; the material and organic bonds of union have been severed, but by this freedom of movement, the psychical connection of the whole has been attained in a much higher degree.

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."<sup>1</sup>

PROFESSOR WILLIAM D. GUNNING.

BY FREDERIC MAY HOLLAND.

AN ADDRESS WRITTEN FOR THE MEMORIAL SERVICE TO PROFESSOR WILLIAM D. GUNNING, HELD AT CAMBRIDGE, MASS., AUGUST 5TH, 1888.

## INTRODUCTORY HYMN.

O Earth, thy past is crowned and consecrated  
With its reformers, speaking yet, though dead:  
Who unto strife and toil and tears were fated,  
Who unto fiery martyrdoms were led.

O Earth, the present too is crowned with splendor  
By its reformers battling in the strife;  
Friends of humanity, stern, strong, and tender,  
Making the world more hopeful with their life.

O Earth, thy future shall be great and glorious  
With its reformers toiling in the van;  
Till truth and love shall reign o'er all victorious,  
And earth be given to freedom and to man.

That majestic Sphinx,\* the guardian angel of these peaceful dwellings, asks a question far more difficult than the old Theban riddle. Why, she says, is life so incomplete? Why is this silent city peopled with children who had scarcely given any sign of what they were capable of becoming, with young lovers who saw nothing but roses around them as they closed their eyes, and, sadder still, with men and women who were already in the full tide of usefulness and honor? Our friend, in whose memory we meet, was an unconscious prophet of his own untimely end, when he said, in a brilliant article in *The Index*, "*Finis* is a word which nature never spoke." "This creation is incomplete. It is no miracle, no theophany. It is the passing phase of a scheme which is developing from a background of eternity." "Man is still incomplete," he adds, "a foundation whose completion transcends the powers of nature."

What I honor most about our friend's life, is that it was one which could not be completed. He left his work unfinished in his sixtieth year. He could not have finished it if he had reached four-score years, or even a century. And this was not because he did not labor zealously and patiently. Look at the records of his boyhood. See him, despite his fondness for society, preferring books to play or supper. See him delighting in nothing so much as in roaming the woods and fields in search of rare plants. See him, a little

later, always keeping an open book beside him on his tailor's bench. Such tastes did not suffer him to sit there long. In 1854, we find him a graduate, at the unusually mature age of twenty-six, from Oberlin, then famous not only for sympathy with the slave, but for hospitality to women. He had already done some teaching and made a study of law; and that fall he took part, as an opponent of slavery, in the campaign which triumphed in the election of his candidate, Governor Chase, of Ohio, afterwards Secretary of the Treasury. Mr. Gunning soon found that his true field was not law or politics, but science. In 1859, he was busy lecturing and investigating in the service of the State Board of Geology of Illinois. He had studied comparative anatomy in New York City, before he came, in 1863, to Cambridge to hear Agassiz, who spoke highly of his powers. Four years later he was working in London, and talking with Huxley and Herbert Spencer. He was an early and open advocate of evolution; and this highest result of thought formed a frequent theme of the brilliant lectures which he delivered during the last twenty years all over the country, from Massachusetts to California. High praises are given by Unitarian and Orthodox clergymen,—I mention this because it is even more to their credit than his,—not only to his lectures but to the book which he published in 1877, under the title of "*Life History of our Planet*." The *Popular Science Monthly* calls this "a successful attempt to popularize a great branch of science without sacrificing or cheapening it," and adds that "the author has invested the great historical problem of the earth's past life with unusual interest and attractiveness." This volume is soon to be reprinted and accompanied by another, made up of contributions to the periodical just mentioned, to *The Index* and to *THE OPEN COURT*. Among the characteristic titles are these: "*The History of Niagara Falls*," "*Have Plants a Pedigree?*" "*The Sisterhood of Worlds*," "*The Sun in Religion and Science*," "*The Moon in Life and Death*," "*The Evolution of God*," "*Old Morals and New Ethics*," "*Prophet and Sibyl*."

But it would be doing more justice to Prof. Gunning to quote him than to talk about him. In various sermons and lectures he says: "One of our poets, in a scene in which angels meet from different spheres,

\*A huge granite monument facing eastward, near the entrance to the chapel in Mt. Auburn, commemorating the preservation of the Union, and the Emancipation of the slave, executed by the sculptor Martin Milmore. Designed and given by Dr. Jacob Bigelow.

describes an angel standing aside from his companions with folded wings, bowed head, and tearful eyes. And the angels said: 'Who is that?' And another angel replied: 'It is the angel of the earth. She is always weeping.' "O my earthly friend and brother! The angel of the earth should be known by all the celestials as the 'Glad Angel.' If she is tristful, her tears flow over the \$300,000,000 in the coffers of one man more than they flow over the empty coffers of another. Her tears will never dry till such crime against humanity, as \$300,000,000 to one man is impossible. A smile should chase back her tears every day a man invents a machine to abridge the labor of men. Let the higher enjoyments of one bring the largest meed of joy to the many. Wipe the grime from the brow of the toiler, weary and heavy-laden, and make the angel of earth the glad angel." "So will the dream of to-day be the life of some glad tomorrow." "O Prophet! O Sibyl! Through the mists of earth thou didst see the city of God. Echoes from another shore of being fell upon thine ears. Flashes from hills of light beyond the vale fell upon thy eyes. On our ears, dulled by din of the marts of trade, by furnace blast and whirr of machinery, thy message falls low and inarticulate. It will yet blend with the voice of science, and the symphony will be as balm on hurt souls of men." "Science came among men as a slayer of gods. She laid her hand on the sun, and found him the bubble of a gigantic earth; she laid her hand on matter, and found it a shadow cast by force; on force, and found it a mode of motion; on lightning, and found it not; on light, and found it vibration of ether; on darkness, and found it quiescence of ether. At her touch, mystery after mystery melts away, but only to reappear in one universal mystery."

I remember no articles in *The Index* and *THE OPEN COURT* better than Professor Gunning's. They were full of important facts, told in the most interesting way possible, and written with a plain purpose of always telling the whole truth on the subject, and not keeping the best part back for that more convenient season which never comes. I was recently reading an essay by a lady who says that all disease is due to artificial habits of life, and justifies herself by asserting that wild animals are never sick. This assertion seemed incredible; but I could not make out the precise truth, until I happened to open a back number of *The Index*, where Professor Gunning calls attention to the fact that of several hundred lions and tigers shot by a French expedition in Algiers, every one had something the matter with its lungs. I also remember his saying that man would be the gainer for exterminating all the plants and animals, except about one species in five hundred. These and similar statements were meant to expose the common misrepresentation

of the earth, as providentially adapted to all the wants of man, and of nature as divinely perfect. This pious optimism assumes in the interest of religion, that whatever is, is right. Men are taught to accept all natural phenomena as perfect. It is but one step farther to accept all social institutions, especially those of great antiquity, as perfect also; and the result is opposition to philanthropy and reform. Nothing is more essential to progress and improvement than to believe of the world, that, as our friend says: "It is not good; but it is the raw material of good. Its excuse for being is that it is not always to be." Thus our friend served the cause of humanity in his uncompromising loyalty to truth. No wonder that, highly as physicians and college presidents enjoyed his lectures, he never held a permanent professorship in any college. It is a great pity, for no one could have done more to save young men and women from the sad mistake of thinking science dry or dismal. He would have shown them that nothing has such thrilling interest. But this was made impossible by passages such as I have just quoted. It is easy to see why, when we remember that, close to these very grounds, resides one of the most original and scholarly of living metaphysicians, a man of spotless character, burning zeal for imparting knowledge, and great success as a teacher. One of the dreams of his life was to be professor of philosophy in some university; but he never has been, and never will be. He deliberately made it impossible by taking the unpopular side in obedience to conscience, while a Unitarian clergyman. The same influences which have kept Frank Abbot from doing the work for which he was pre-eminently qualified as a Harvard professor, kept William D. Gunning also from his rightful place. It is due to his memory to say this plainly. We honor him all the more for making great sacrifices in the cause of truth.

It is pleasant to find him, after retiring for some years to rest from lecturing in Florida, return once more to the platform as speaker to an Ethical Society in Keokuk, Iowa. His exposition of the eternal principles of morality from the standpoint of science was a great success. Catholics, Orthodox Protestants, and Free-thinkers listened eagerly to his lectures. Men, women, and children gathered in classes, which he always met faithfully, no matter what might be the state of his health. He had been for some ten years troubled by symptoms in his throat which now developed into bronchitis. He had to leave Keokuk, but he could not give up his work. He accepted a call from Unity Hall Society, in Greeley, Colorado, and came there last January, a sick man. The trustees urged him to rest; but he felt too heavy a burden of thoughts which he must speak out. Twice he mounted

the platform, to be more impressive than ever before. He had already announced his third subject for the next Sunday, "Calm after Storm," when he was seized with the attack which carried him in six days, on March 8th, forever beyond all life's storms.

For him the storm has passed away. And after it, what? The calm of silent night? The calm of a summer noon, amid the fragrance of Paradise gardens, and angelic symphonies? His own choice would be neither of these. He would say, "No calm for me, but steady sailing onwards, through new realms of knowledge and duty!" Has he had his wish? We can at least believe that beyond the veil, there is no failure or disappointment, as there is no sickness, or pain, or sorrow. It is safe to make such denials; but what can we affirm? Still the Sphinx sits silent. Her lips do not open. Her riddle remains unsolved.

I cannot even think of our friend as completing his work, for I know that it was of a kind which must always be incomplete. When a theory is complete, it is laid aside and forgotten. By and by perhaps, it is taken up again, but only to be torn to pieces. All the field of knowledge is strewn with the fragments of philosophies and theologies, which, as soon as they were finished, gave place to new ones, destined likewise to pass away. I say this only to call attention to our friend's good fortune, in having given his life to a work which never can be finished, and which therefore must continue to interest the best thinkers so long as man endures. It has always done so. Long before there were any writers on science, long before there were any books, perhaps even before there was any articulate speech, in those dumb ages of human life, compared with which all history seems petty as an item in a newspaper, men were learning by sight and touch of the outer world. The earliest knowledge came through observation and experience. The most sure and useful knowledge always has. Modern science is merely preserving, interpreting, and enlarging the results of the primeval and eternal method, which is much more honored to-day than it ever has been before, since men began to record their thoughts. All that is built in this field becomes part of a structure which will outlast every other edifice. What Professor Gunning discovered in the Gulf of Mexico, or in Buzzard's Bay, has just as much authority as if it had been announced by Aristotle. What interest and value his observations have to-day, will remain imperishable. All the scientific knowledge of to-day will be part of the knowledge of the future; and much of it will prove more precious then than now. The scientist rests from his labors; but the work of science goes on continually. His name is treasured up with love and honor by those who follow him. His observations and discoveries are used again and again as

seed-grain, to yield harvest after harvest of new truth. Business, politics, and fashion, metaphysics and theology, all move in the paths which science marks out. All men do homage to the scientist, some delighting to honor him, others paying all the more sincere a tribute, because it is perfectly unconscious. His memory is enshrined in the grandest of mausoleums, the only one which can be called eternal. This is our friend's immortality. We need not try to honor his memory. He has made it permanently honorable. We can only hang our little wreaths of everlasting upon the stately monument which mightier men than we reared long ago.

## CLOSING HYMN.

O word divine, like healing balm	Who never mourned hath never known
To hearts oppressed and torn, Thy heavenly consolation falls, "Blessed are they that mourn!"	What treasures grief reveals,— The sympathies that humanize, The tenderness that heals,
To every hope by sorrow crushed A nobler faith succeeds; And life, by trials furrowed, bears The fruit of loving deeds.	The power to look within the veil And learn the heavenly lore, The key-word to life's mysteries. So dark to us before;

Hath never known how full of strength  
Our human spirits are,  
Baptized into the sanctities  
Of suffering and of care.

## GHOST STORIES.

A STUDY IN FOLK-LORE BY L. J. VANCE.

PART III.  
(Concluded.)

Glend. I can call spirits from the vasty deep.

Hot. Why, so can I, or so can any man;

But will they come when you do call for them?

(Henry IV, Part I—Act III. Sc. I.)

VIII. Finally we reach those ghosts that 'needs come from the grave to tell us this.' Ghosts of this kind come because they cannot help themselves. They are subject to the wishes and whims of their lord and master.

Athwart ghost stories in every clime and in every age comes the shadow of the man-who-talks-with-the-spirits. Such a man, like Owen Glendower, is not in the roll of common mortals. Like him, magicians loudly boast of their power to call spirits from "the vasty deep." They bring not only storm and sunshine, but they can bring from the grave spirits, good, bad, and indifferent. They go through certain mystic rites and secret ceremonies, whereby they converse with bodiless beings, "as with familiar friends."\* There is hardly a tribe so rude, so barbarous, that has not its Medicine-man, Meda, Jossakeed, Shamán, Angakok, or whatever name for magician, necromancer, 'medium,' we may take. When the Jesuit missionaries visited the Indians of North America they were surprised, to say the least, to find that the different tribes had 'medicine-men'—*jongleurs*, as Père Le Jeune

\* Schoolcraft, IV, p. 647; IV, pp. 490-498.

calls them.\* Yet, what Le Jeune regarded as peculiar to the Indians is familiar enough to uncivilized and civilized folk in all quarters of the globe.

Now, some of the queer doings of the savage necromancers who converse with ghosts, find fitting parallels in the doings of the 'professional' mediums, who call up disembodied spirits. Mr. Woods has recently printed an account of the manner in which the Shamán, or doctor-wizard of the Thlinkets goes to work.† "These Shamáns," he says, "claim to be able to see the 'life,' or soul leaving the body, or being dragged from it by spirits. . . . It is their business to seize the soul with the mouth and breathe or force it into the body." To this he adds: "I only saw one Shamán exorcising, and I do not believe he would have continued, had he known I was observing him. He kneaded, pounded, yelled, chanted, frothed, swayed to and fro, played tunes all up and down the suffering patient, blew in his mouth and nostrils, and literally worried the life out of him. In general practice, the Shamán continues till the wretched patient declares himself better."

A very similar description of the medicine-man's doings is given by Mr. Im. Thurn.‡ In this case the 'wretched patient' was Mr. Im. Thurn himself. Now, among the Indians of Guiana the doctor-wizards are called Peay. Having had a headache all day, Mr. Im. Thurn went to the Peay, and asked him to drive out the bad spirit that caused his pain. He was taken in the evening to the Peay's hut, and there went through a most remarkable series of crucial experiments. After the place had been darkened, a succession of horrible noises began; now low, mysterious whistlings and then loud, unearthly peals of what seemed laughter; at one time he would feel the near presence of some invisible being; at another time, the light pressure of a ghostly hand passed over his brow. This strange sort of hypnotism continued all through the long hours of the night, and when morning-light came, much to Mr. Thurn's relief, he was asked whether or not he was better. Replying in the negative, the Peay said he did not know how that could be, and thereupon produced a caterpillar or worm which, he said, had caused the ache.§ The whole thing, concludes Mr. Thurn, "was a very clever piece of acting and ventriloquism."||

From the same quarter comes a somewhat different kind of a savage ghost story. The story is told by W. Wyatt Gill and James Chalmers in their 'adventures

in New Guiana."\* "Last night, after turning in," they write, "we heard a peculiar noise as of some one in great distress, then loud speaking in a falsetto voice, and knew then what was up,—we had a spiritist in the village, and revelations were now about to be made. We were all named, and the places we were to visit. I felt somewhat anxious as to the revelation, for if it should be the least doubtful as to our going, no native would . . . stir with us. However, the revelation on being interpreted to us by Kena was all right. . . . The spirit dilated at some length on the good qualities of foreign tobacco, and the badness of the native stuff. . . . While at the morning coffee he (the spiritist) came and sat down along side of us, and we learned from him that the spirit of a deceased friend comes into him, and then things are revealed; the spirit speaking through him. He said that when we were at Ekiri, a few weeks ago, he knew it, and told the people of the village of it." Again, the authors write that, "our spiritist gave us a very short and indistinct *séance* last night. A man speared the other day in a Wallaby hunt, he told us was dead. He seemed to be raving a good deal."†

Once more, if the reader thinks that Indians are not familiar with some of our best known 'professional' spirit-tricks, he is mistaken. Time was when the celebrated 'rope-tying' trick was explained by the agency of spirits. Then the Davenport Brothers came and performed the same bit of jugglery unaided by any spirits. Col. Garrick Mallory has recently written an account of a wager made about the year 1858, between one Beaulieu and an Indian jossakeed at White Earth Agency, an abridged account of which is as follows:

"A medicine-lodge was made. The interior diameter was less than four feet, covered with blankets and birch-bark from the ground to the top, leaving an orifice of about a foot in diameter open for the ingress and egress of spirits, but not large enough for a man's body.

"A committee of twelve was selected to see that no communication was possible between the jossakeed and confederates. These twelve men were reliable people, one of them being the Episcopal clergyman of the reservation. The spectators were several hundred in number, but stood off, not allowed to approach.

"The jossakeed then removed his clothing, until nothing remained upon his person but the breechcloth. Beaulieu then took a rope (of his own selection for the purpose) and first tied and knotted one end about the ankles; the knees were then securely tied together; next the wrists; after which the arms were

passed over the knees, and a billet of wood passed under the knees, thus securing and keeping the arms down motionless. The rope was then passed around the neck again and again, each time tied and knotted, so as to bring the face down upon the knees. A flat stone of black color—which was the jossakeed Manedo, or amulet—was left lying upon his thighs. The jossakeed was then carried to the lodge, placed inside upon a mat on the ground, and the flap-covering restored so as completely to hide him from view.

"Immediately loud, thumping noises were heard, and the framework began to sway from side to side with great violence; whereupon the clergyman remarked that this was the work of the Evil One, and it was no place for him; so he left, and did not see the end. After a few minutes of violent movements, and swaying of the lodge, accompanied by loud inarticulate noises, the motions gradually ceased, when the voice of the juggler was heard telling Beaulieu to go to the house of a friend near by, and get the rope. Now, Beaulieu suspecting some joke was to be played upon him directed the committee to be very careful not to permit any one to approach while he went for the rope, which he found at the place indicated, still tied exactly as he had placed it about the neck and extremities of the jossakeed. He immediately returned, laid it down before the spectators, and requested of the Jossakeed to be allowed to look at him, which was granted, but with the understanding that Beaulieu was not to touch him.

"When the covering was pulled aside, the jossakeed sat within the lodge, contentedly smoking his pipe, with no other object in sight than the black stone Manedo."\*

A variant of the above performance took place at Odanah on the Bad River Reservation in Wisconsin, and is narrated by Col. Mallory as follows: "The Shamán was tied much as before mentioned, but with all of his clothes on; a fish-net being tied above his clothes, enveloping the whole person; and horse-bells were attached to his body, so as to indicate any motion. When examined afterwards, the clothing had been stripped from his person, the nets, and ropes, and bells placed in a separate pile in the lodge, and the clothing was found by direction under a designated tree a mile off."

Before passing from this branch of the subject, let us note some savage *séances* on a level with "manifestations" which the Psychical Societies in England have investigated so learnedly. We might take the *séance* witnessed by Mr. Brough Smith, in Australia,† where the sorcerer, "lying on his stomach, spoke

to the deceased, and the other setting by his side, received the precious messages which the dead man told." We might, also, give the experiences of Dr. Moffat with African jossakeeds, well worthy of recital. But instead, I give two short but lively accounts of savage *séances*, which may well hold their place by the side of any "authenticated facts" furnished by the Psychical Society.

The first account is taken from Auckland's "Old New Zealand," and is told by the Pakeha Maori, an English gentleman, who lived among the natives as one of them.\* Among the New Zealanders the medicine-man goes by the name of 'Tohunga.' The exhibition took place in a darkened village-hall, where the spirit of the Pakeha Maori's own friend was called "from the vasty deep" by the Tohunga. "Suddenly, without the slightest warning, a voice came out of the darkness. . . . The voice was not the voice of the Tohunga, but a strange, melancholy sound, like the sound of a wind blowing into a hollow vessel." 'It is well with me: my place is a good place,' said the spirit. "The spirit gave answer to a question which proved to be correct, and then 'Farewell,' cried the spirit from deep beneath the ground. 'Farewell,' again, from high in air. 'Farewell,' once more came moaning through the distant darkness of the night."

The second account is taken from Mr. Howitt's "Kamilaroi and Kurnai."† "The fires were let go down. The Bira-ark (sorcerer) uttered the cry of 'coo-ee' at intervals. At length a distant reply was heard, and shortly afterwards the sounds as of persons jumping on the ground. A voice was heard in the gloom asking, in a strange intonation: 'What is wanted?' Questions were put by the Bira-ark, and replies given. At the termination of the *séance* the spirit-voice said: 'We are going.' Finally, the Bira-ark was found in the top of an almost inaccessible tree, apparently asleep." Mr. Howitt adds, 'it was alleged that the ghosts had transported him there at their departure.'

A variant of the above *séance* is recorded by Mr. Howitt in the "Journal of the Anthropological Institute." "A man who was present in the camp on the occasion of one of Mundanin's performances, said as follows: 'In the night his wife shouted out, 'He is gone up.' Then we heard a whistling in the air, first on one side of us, then on the other, and afterwards as of some people jumping down on the ground. After a time all was quiet. In the morning he found Mundanin lying on the ground near the camp, where the 'Mrarts' (ghosts) had left him. He had a big log across his back. He seemed as if asleep, and when we woke him up, and took the log off him, he began

\* Another account of the rope-trick, by an Angekok, is given in Crane's "Hist. of Greenland."

† "Aborigines of Australia," Vol. 1. pp. 107-109.

\* Auckland, p. 138.

† P. 231.

to sing about the 'Mrarts,' and all he had seen above."\*

What can be said of savage ghosts that come when you do call for them? They are kith and kin to 'professional' ghosts. What do we think of such ghost stories? Well, they are on a par with the "recorded instances" of performances given by our latter-day 'mediums.' Suppose, at the close of a *séance* in the Academy of Music, Miss Kate Fox should be found in the top of a telegraph-pole, in front of the hall, apparently asleep? We should say that her exhibition of "powers" was no greater than that given by the Australian Bira-ark. If this view be correct,—and it is,—modern 'manifestations' become plain enough when put side by side with similar manifestations among savage men.

Remember that ghost stories of this kind were perfectly familiar to the ancient Greeks and Romans. Perhaps the liveliest account of an ancient *séance* is told in one of the dialogues of Lucian. In the *Philopseudes*, Kleodemos says, that he saw a Hyperborean conjurer flying and walking on the water. "What!" says his astonished listener, "you saw the Hyperborean man flying and walking on the water?" "To be sure," replied Kleodemos, "but what's the use of talking of such trifles, considering what other manifestations he showed us—sending loves, calling up dæmons, raising the dead, and bringing in Hekate herself visibly, and drawing down the moon?" The speaker says that the conjurer had his four minæ down for sacrificial expenses. "He then made a clay Cupid, sent it flying through the air to fetch the girl whom Glaukias had fallen in love with, and, presently, lo! she was knocking at the door!"

It was against the magical practices of these pagan conjurers that the Fathers directed much of their energy and a great deal of their thunder. And we find that the sharpest and shrewdest opponents of the Early Church were these very conjurers who attempted to show that the so-called 'miracles' were in their *répertoire*. Yet, in a few hundred years, their Christian successors claimed to do what the Fathers had vehemently denied. Thus, mediæval mystics enjoyed all the attributes commonly ascribed to jossakeeds, or medicine-men. They could call up spirits from the deep, could converse with the dead, and could enter the abode of the disembodied spirits.† They manufactured homunculi, and learned to make magic ointments, by virtue of which they sailed through the air.

Consequently, the literature of the Middle Ages is full of stories of half-starved saints who held mystic intercourse with bodiless beings, of fat-witted sinners

who practiced the 'Black-art.'‡ Still, the sinners knew just enough science to make their art look black to the common people. They 'passed the nights of years in sciences untaught.' Hence, there arose the superstition among the folk that deep learning was necessary for an exorcist. Indeed, in the 'Comedy of Errors,' the schoolmaster, Pinch, is introduced in this rôle. In 'Hamlet,' the rough soldier, Marcellus, alluding to the ghost, says:

"Thou art a scholar; speak to it Horatio."

Another mediæval belief was, that only those born with certain spiritual gifts could exorcise disembodied spirits. The *Malleus Maleficarum*, the orthodox authority, declares that 'holy men' were by spiritual sorcery marked with the stigmata.

Such a belief has survived, for example, in negro folk-lore. According to the negro superstition, only those "born with a caul" can converse with ghosts. In Mr. Jones's recent volume of "Negro Myths," we have July's declaration that "people wuh no bin born wid caul kin yeddy (listen to) sperit, but dem can't shum" (see them). "Me an' sperit good fren"—and this is what all medicine-men say.†

But, passing down to modern times, a great revival of ghost stories of this kind took place after the wondrous revelations of Emanuel Swedenborg, in the last century. Here was a man who, like July, was good friends with the spirits. Here, too, was a man who drew no hard and fast line between the spectres of his imagination and the visions of his reason.‡ Swedenborg claimed that to him was given the power to enter the spiritual world, and to see what was going on there. "The spirits," said he, "knew no other than I was one of themselves." From these and other similar statements Swedenborg simply claimed to see, talk, and walk with his spiritual companions—just what every ghost-seer has always claimed,—no less, no more.

Let us give, by way of concluding this comparative study of ghost stories, a short account of the modern *séance*, and see how it compares with the savage. It is abridged from Walter Thornbury's description of a *séance*, in 1871:

"I went up into a stuffy parlor, and found about fourteen people, nervous and evidently uncomfortable. Presently, Messrs. A. and C. (two young men) entered, seated us around a table, and requested us to

\* For a brief summary of this period in Europe, see Mr. Lecky's "History of Rationalism," Chapter I, "Magic and Witchcraft," while for ghost stories see Glanville's "Sacerdismus Triumphatus," Bodin's "Démonomanie des Sorcierers," Madden's "Phantasmatia"; Thiers, "Traité des Superstitions," and Garinet, "Hist. de la Magie en France."

† "The manner in which a man became a Bira-ark was generally believed to be, that being found alone in the forest by the 'mrarts' (ghosts) they took him up with them and taught him." A. W. Howitt in *Journal of Anth. Inst.* Vol. XIII, p. 196.

‡ Dr. Maudsley, ("Body and Mind") makes out a *prima facie* case of madness against Swedenborg.

\* On Australian Medicine-men; or Doctor and Wizards of some Australian tribes." A. W. Howitt, "Journal," Vol. XVI, p. 23.

join hands. The gas was turned down, and the *séance* began. A. was at one end of the table, facing C., at the other. . . . All at once Mr. C., at the further end from me, began to gurgle and groan like a person in an epileptic fit. Some one cried: 'Turn up the gas!' It was done, and we beheld the medium with his head twisted in the folds of a red tablecloth. . . . Things looked dull. All at once we were hailed by one of the most tremendous gruff bass voices that ever hailed a man-of-war. John King, the favorite spirit of Mr. A., had appeared with a grumbling announcement of his presence. 'Who is this John King?' inquired one of the party. 'He lived about three hundred years ago,' said some one in the dark. On John King growling that there he was and what did they want, a skeptic exclaimed, in a dramatic manner: 'Rest, rest, perturbed spirit.' . . . After a few minutes there were sounds of violent blows, and several skeptics were struck on the head, a sofa-cushion was flung at me. A man near me said, he thought he felt a cold breeze passing over his hands and a cold finger touch his. . . . A lady requested that 'Kate' appear. Kate is Mr. A.'s second 'familiar.' Presently, a little whiffing voice announced Kate. By and by two stones were thrown violently on the table, but no one expressed audible alarm. . . . Sometimes I fancied the table jerked, or reared a little; sometimes I thought I heard animal feet pattering up and down the table. . . . No more voices coming, Mr. A. proposed our changing places 'to improve our conditions,' . . . but no result came.

Here ends our comparison of stories of ghosts that 'come when you do call for them.' The gist of the whole matter has been briefly but clearly stated by Mr. E. B. Tylor, who studied the subject from the anthropological standpoint:—"Suppose a wild North American Indian looking on at a spirit *séance* in London. As to the presence of disembodied spirits, manifesting themselves by raps, noises, and other physical actions, the savage would be perfectly at home in the proceedings, for such things are part and parcel of his recognized system of nature. The part of the affair really strange to him would be the introduction of such arts as spelling and writing, which belong to a different state of civilization."<sup>7</sup>

There are some things 'Shamán,' and 'medium' can do, but a great many things they can not do. What they can *not do*, has been quaintly summarized by the 'Melancholy' Burton thus: "And yet for all this subtlety of theirs, as Lysius well observes, Phys. Stoicor. lib. I. chap. 17, neither these magicians nor devils themselves can take away gold or letters out of the mine or Crassus's chest, *et clientelis suis largiri*; as Bodin notes they can do nothing *in judicium decreta aut panas*, . . . they cannot give money to their clients,

alter judge's decrees, or councils of kings, these *minuti Genii* cannot do it, *altiores Genii hoc sibi adseruunt*, the higher powers reserve these things to themselves." Anat. of Melanch., Part I. Sec. 2, Sub. 3.

Now, the method of folk-lore is to compare ghost stories wherever we may find them. My general thesis has been, and is now, that the difference between the savage ghost story and the ghost story of civilized folk is one of degree, not of kind. We believe that stories about ghosts arose in savage minds, which drew no hard and fast line between dreams and realities, which believe in a "choir invisible," while notions about the shades or spirits of the departed were vague, confused, and irrational. Holding this, we have found that the stuff of ghost stories—the mind-stuff as the Prof. Kingdon Clifford might call it—is everywhere the same. It is the world over as with us, "*c'est partout comme chez nous*!"

But it may be asked, how did it ever come that notions of ghosts were born in the savage brain? How do you account for the "facts" adduced by Messrs. Gurney, Myers, and others? To answer the first question is no part of our business.

As to the "facts" collected by a great number of psychical inquirers, a word may be said. We agree that there is a great mass of evidence from persons who declare that *they* actually have seen beings and things materialize out of nothing. They ground their belief on the solid basis of their senses. That is right enough; but can the senses be misinformed?

That is to say, can I doubt my own eyes? Now, the *rationale* of seeing is pretty well known. We know that light emanating from each point of an object falls upon the eye: that it passes through several lenses and humors and is made to converge upon a point in the retina, where a picture is formed as in a camera-obscura: that the object is thus placed in direct communication with the brain. Beyond this we do not know. No one can say just how the image on the retina is connected with the impression on the brain. When a person tells us that he "sees" an object, let us say a ghost, his belief may come from some external object acting upon his brain through the eye, or it may proceed from some *other action* upon the mind.

Let me illustrate. If a blow is struck on the eye, a man says that he "sees," and he may 'see' things, too, which have no visible existence. An electric current applied to the nerves of the eye may also cause a man to 'see': if applied to the nerves of the ear he may 'hear' sounds and noises amid the deepest silence. To sum up: a man 'sees,' as he truly believes, objects which actually have no visible existence: he 'hears,' as he firmly believes, noises and sounds which likewise have no audible existence.

Truly, our world is full of sights and sounds that

<sup>7</sup> Primitive Culture. Vol. I. p. 155.

are within the ken of some, but beyond the ken of others. Thus, a ghost story is a good deal like Keat's

"Doubtful tale from fairy-land  
Hard for the non-elect to understand."

The non-elect can better understand

'The tale  
Of horrid apparition, tall and ghastly,  
That walks at dead of night, or takes his stand  
O'er some new-opened grave, and, strange to tell,  
Evanishes at crowing of the cock.'

For they know that ghost and goblin cannot bear the strong morning sun-light, and so vanish at the crowing of the cock at the dawn of day.

#### THE MEMORIAL SERVICE TO PROF. WM. D. GUNNING.

The Memorial Service upon the interment of the remains of the late Professor William D. Gunning, whose death occasioned so lamented a loss to the world of advanced Free Thought and the friends of Ethical Culture, was held at Cambridge, Mass., on the 8th of August of the present year. The services were singularly impressive. Prayer was offered by Rev. Dr. Holland of Concord, Mass. The two beautiful and appropriate hymns, printed in this number of *THE OPEN COURT* at the beginning and close of Mr. Frederic May Holland's Memorial Tribute, were expressively rendered by lady members of the Ethical Society of Boston. The Service of Song was due to Mrs. C. M. Bisbee. In a touching address, Mrs. Bisbee spoke as follows:

"All sorrow is sacred, and when a great presence like that of our friend is taken from our midst, one feels so inexpressibly sad that words, the tenderest, seem irreverent. We are tempted to ask: Why all this sacrifice? Why this apparent break in Nature's course? The death of Mr. Gunning came to me in this way. Just as ethical culture demanded a broader basis, one free from the sectarianism of philosophy as of theology, its able representative in the West and advocate of this higher platform, is withdrawn. I feel the loss to our New England States, for the letter I have in hand (dated December 12, of last year) promises, if possible, co-operation with our Boston Ethical Society in an earnest Spring Convention. What help for a grief like ours? I find it first of all in the invariableness of law. Brother Chadwick has said: 'Invariable law is but the scientific way of saying Everlasting Faithfulness.' What can be more inspiring than perfect confidence in this? I find help again in the enthusiasm of our friend for good—an enthusiasm so pure and so intelligent that it leaves a trail of light behind. I believe his genius has brought that 'great and commanding moment in the annals of the world' which Emerson calls a 'triumph of enthusiasm.'"

### CORRESPONDENCE.

#### PROF. W. D. GUNNING.

To the Proprietor and Editor of *THE OPEN COURT*.

DEAR SIR:—On August 8th, Memorial Services were held at Mt. Auburn Cemetery, Cambridge, Mass., on the interment of the remains of the late Prof. William D. Gunning. As you have already noticed in *THE OPEN COURT*, his decease occurred at Greeley, Colorado, March 8th of this year. I send you some local newspaper reports, and Mr. Fred. May Holland's manuscript address, written for the occasion, not before in print.

There was a paper which, had Prof. Gunning continued with us, he would have given you in due time. It was the treatment, or rather reconciliation, of the differences in the arguments of Dr. Montgomery and Prof. Cope, as published in *THE OPEN COURT*. It was matured in his mind, but his social work, and sudden

physical decline, prevented the writing out, or committing the points even verbally to me. \* \* \*

Had I been aware what was in store—that the close of my husband's life was so near, I could have accomplished the writing of the Cope-Montgomery article. But he was surrounded by the demands of social labor which allowed no time for a thought of the end to creep into my mind. Hope always sustained me, at least until the final attack, six days before the close. He was convinced for a long time that the disease, bronchitis, would conquer at last. Still he never acted the part of an invalid. He mingled in society—and sustained his desk work until a month before the close. It is but another expression of the "Incomplete."

With earnest wishes for the success of your journal, I am truly yours,

MARY GUNNING.

WALTHAM, MASS.

#### MR. SOL. LEVY IN REJOINDER TO "WHEELBARROW."

To the Editor of *THE OPEN COURT*:—

This is not a personal controversy with "Wheelbarrow." I am not fighting men, but contending for principles. Funny stories and humorous episodes of "Wheelbarrow's" life will be of little value to the solution of serious problems.

I can give not one, but many, instances where economy has had the effect of reducing wages, and I hope that after having demonstrated this it will be easier for my opponent to treat this "doctrine" courteously. The reason cigars are made at such pitiable wages, where formerly people in this industry enjoyed comparatively fair earnings, is, that many Bohemian workmen have come over who are more economical and whose standard of living is considerably lower, to whom a filthy room in a crowded tenement is both a shop and a "home," and who force the American workmen to either accept their standard of living or go into other occupations. The wages of Pennsylvania miners have been reduced to about a dollar a day, by getting frugal and economical men from Italy and Hungary. These people, by denying themselves every comfort, still manage to save some money, which again has the tendency to further reduce wages.

So, in all branches of production and in all countries, the facts are patent that the strictest economy, long hours of labor, and low wages go hand in hand. According to "Wheelbarrow's" logic, the highest wages ought to be paid in China. What class of people is more economical, more sober, and more industrious? Yet it avails them nothing. Certainly, no one advocates extravagance or intemperance. I consider sobriety a virtue, but sobriety does not mean abstinence.

I have slightly misquoted Col. Ingersoll, having quoted from memory. To show how even a great lawyer and a man of rare accomplishments is liable to lose his reputation as a scholar when confronted by "Wheelbarrow's" school of political economy, I here quote the exact language in reference to the point under dispute. "The capitalist comes forward with his specific. He tells the workman that he must be economical, and yet, under the present system, economy could only lessen wages. Under the great law of supply and demand, every saving, frugal, self-denying workman is unconsciously doing what little he can to reduce the compensation of himself and his fellows. The slaves who did not wish to run away helped fasten chains on those who did. 'So the saving mechanic is a certificate that wages are high enough.' Does the great law demand that every worker live on the least possible amount of bread? Is it his fate to work one day that he may get enough food to be able to work another? Is that to be his only hope—that and death?" (Some Interrogation Points, *North American Review*, March, 1887, page 226.)

But this is not to be done by throwing chunks of wisdom at the head of the laborer by preaching temperance, frugality, and self-

denial, by telling him to be good, virtuous, and economical; it can only be done by restoring to labor its natural rights, by opening up the storehouses of nature, by giving labor a chance to employ itself.

What is more unnatural than a laborer forced into idleness? Mr. Powderly tells us that there are more than a million of people out of work. Is not labor the creator of all wealth? The factor that satisfies our wants and administers to our desires? Are all our wants satisfied, all our people fed, clothed, or housed? Why, then, cannot labor employ itself to satisfy its accounts? The answer is plain. Because land, the indispensable passive factor of production, without which labor cannot engage in creating wealth, is fenced in; the treasures of nature are locked up and the monopolist holds the key, and before the laborer is permitted to work, he must pay blackmail for the use of what is his own to an equal extent with all.

This is the cause which we single-tax men have attempted to remove; not that we believe it to be a cure for all ills, but we hold it to be the most fundamental reform, one that must precede all others, and that will make all other reforms easier. Seeing the human miseries it causes, we see the happiness its removal would bring; but he who can see only in it a mere fiscal change, who judges the benefit of this reform by the amount of dollars it will bring into the public treasury, who considers it a tax on the products of labor, a "punishment" for the use of the soil, will certainly look with a feeling of contempt mingled with pity upon our enthusiasm, to his mind so out of proportion to the results to be obtained.

Every reference to the scheme is a proof that "Wheelbarrow" mistakes both its purpose and effect, and hopelessly confuses a tax on land-values with a tax on land.

He makes it appear that only Mr. George's disciples believe that land values should be taxed to the last penny, thus implying that Mr. George himself entertains no such idea. "We hold," says Mr. George's *Standard*, "that to tax land values to their full amount will render it impossible for any man to exact from others a price for the privilege of using those bounties of nature in which all living men have an equal right of use; that it will compel every individual controlling natural opportunities to either utilize them by the employment of labor or abandon them to others; that it will thus provide opportunities of work for all men and secure to each the full reward of his labor, and that as a result involuntary poverty will be abolished and the greed, intemperance, and vice that spring from poverty and the dread of poverty, will be swept away."

This simple, just, but radical reform, Wheelbarrow terms "the most tremendous feat of engineering ever done by mortal." How singularly all such reasoning conflicts with the well developed and mature opinions of scientific writers may be seen from the following quotations from Herbert Spencer (*Social Statics*, Chap. VIII): "Such a doctrine is consistent with the highest state of civilization; may be carried out without involving a community of goods and need cause no very serious revolution in existing arrangements. The change required would simply be a change of landlords; separate ownership would merge into the joint-stock ownership of the people.... instead of paying his rent to the agent of Sir John or His Grace, he would pay it to the agent of the community.... A state of things so ordered would be in perfect harmony with the moral law. Under it all men would be equal landlords, all men would be alike free to become tenants."

All monopolies rest directly or indirectly upon the land monopoly. That gone, Wheelbarrow cannot point out one monopoly that can stand this change.

But it is said land values are nothing but the products of labor, and therefore in taxing them we will still be taxing industry. If Wheelbarrow can prove this I shall become his disciple to his position on the labor question, whatever that may be. Products of

labor are the results of human exertion, the expenditure of human muscle and mind upon natural resources, the raw material of nature transformed, blended, fashioned, or formed by human exertion for the purpose of satisfying human desires. Land values, however, are not the product of human exertions; they are not a product at all, but simply a value that attaches to the bare land by the growth of a community. The taking of this fund, made by all for the use of all would not be a tax at all but in the correct sense of the term would simply be rent.

Thus it will be seen that this progressive political economy is based, in the last analysis, upon absolute justice, equality, and a clear perception of the rights of man. For it is as true to-day as it was a hundred years ago when the French national assembly declared that "ignorance, contempt, and neglect of human rights" is the sole cause of public misfortune.

SOL. LEVY.

### MONETARY PROBLEMS.

A SERIES OF QUESTIONS ADDRESSED TO "WHEELBARROW."

Mr. Wheelbarrow:—

1. Is a sound financial system the greatest of superstructures upon which any good government rests?
2. Is there a shorter, as well as a better, method of accounts than with money as a circulating medium?
3. Is money, as a circulating medium, other than a representative of value?
4. If there be those who can expand, or contract, the volume or amount of money, and they should so contract said volume or amount, would, or would it not, hamper all persons engaged in adjusting their accounts with others by the use of said circulating medium?
5. If those having said circulating medium should say to those needing it for the purpose of adjusting their account with their fellow, come, you must, by our law, have this circulating medium, in order to adjust your account with your fellow, and while I am aware you cannot afford to pay so much for the use of it, yet, if you will pay our price, we will help you out this once, and that price should be three times what the party could afford to pay, what effect, if any, and more especially if the controller of the volume continues so to act, will such and kindred acts have in driving the buyer of it to poverty?
6. What would you say, if there should be such persons with such a power, as to its being a safe one for them to exert or use?
7. If money be a representative of value, or short method of accounts, what, if any good reason, can you give for such costly representatives as silver and gold?
8. If the increase of wealth in a nation per year be represented by the gain per cent. upon its principal, is, or is it not, true that but the three classes, agriculture, manufacture and mining, create that nation's wealth?
9. If the remaining class, commerce or the wealth-distributors, should take a greater rate than the other three get for their distributing process, will the one not become wealthy and the other three go to poverty?

C. B.

WHEELBARROW IN REPLY.

To the Editor of THE OPEN COURT:—

What have I done that those questions should be thrown at me? I am innocent both of monetary science and political finance. The banker's grammar is very hard Greek to me. The prickly phrases that bristle all over the tree of gold and silver knowledge sting me like the blackberry-thorns of years and years ago. I have never been initiated into the esoteric mysteries of money. The occult jargon of "circulating medium," "measure of value," "double standard," "ratio of exchange," "elastic limit," "minimum reserve," "multiple tender," and all the rest of it, is a perpetual headache to me. I cannot tell the difference between an

obolus and a kobang. I know no more about "Gresham's law" than Gresham did. But the moral "standard" of money may be as plain to me as to the banker or the statesman, perhaps plainer. By that standard all "circulating mediums" must be tried.

It would be easy for me to say, "give it up," and thus escape those conundrums, but that is an ignoble retreat, and especially where the questions include a compliment, implying a belief in the inquirer that I am competent to answer them. This compliment is gratifying to me, and it would be ungracious not to say so. When Mr. Toots was asked, "What are you going to do with your raw materials when they come into your ports in return for your drain of gold," he boldly answered, "Cook 'em." So I will at least attempt an answer though I may fire as wide of the mark as Mr. Toots himself.

I am always a little suspicious of hypothetical questions, and questions which conceal within them an expression of opinion, or the statement of a fact, because a man unskilled in the artfulness of logic, may in his answer unintentionally confess the fact, or subscribe to the opinion. It may be that I am walking into an ingenious verbal trap, but whether or not, I will at least be as brave as Toots.

To the first question I answer, No! I am sure good governments have superstructures greater and stronger than financial systems. It appears to me that financial systems are merely expedients of government. They are only agencies created by government, for purposes of national housekeeping.

The second question is not clear as it might be, and perhaps in trying to answer it I may be springing a dead-fall for myself, but I do not know of any shorter or better way of keeping accounts than with money as a circulating medium.

To the third question, I answer, Yes! It will circulate as a "medium" all round the world by force of its own actual positive worth, when it cannot travel the length of a street as a "representative" of value.

I tread with caution all around the fourth question. I think it conceals a trap big enough for a grizzly bear, let alone Bre'r Rabbit. It begins with "volume or amount of money," and ends with "said circulating medium." Do "money" and "circulating medium" in this question mean the same thing? However, giving the language a liberal construction, and supposing it means the metal coins, and the paper "circulating medium" known as currency, I answer in the affirmative. It would work very great injury to the community if any persons had the power to expand or contract the volume of money, at their own will; and among those persons I include the person called "government," the most dangerous of them all. At the same time I do not see how it is possible to expand money except by digging it out of the ground and coining it. This kind of expansion is always a public benefit, while the expansion of paper credits, which pass under the name of money, is very likely to be an injury, especially to the poor, and all who live by wages.

The fifth question I suppose refers to the rate of interest for money, and suggests, again, the hard bargain between Shylock and Antonio. I wish I knew some way by which those "having said circulating medium" might be induced to share it with those who have none, or, at least, to lend them some of it without exacting usury, but I fear I shall never discover the way.

The sixth question assumes that there are persons who have the privilege of expanding and contracting the circulating medium at will, so that by making money scarce and dear they may exact extortionate usury and oppress the poor. In answer to the question, I promptly say that, if there are persons possessed of such a dangerous power, it ought to be taken from them. It is not a safe one for them to "extort or use;" at least, it is not a safe one for those who happen to be scarce of "circulating medium."

The seventh question assumes that money is only a represent-

ative of value, or short method of accounts. I think that metallic money is all that and something more. It has value of itself outside and beyond its money uses, and that is the reason why it has always been the money paramount. It is "a thing of beauty and a joy forever." Silver and gold are not "costly representatives." They are costly actualities, and in this very costliness lies their supremacy as money.

Is it fair to demand of me *good reasons* for using silver and gold as money? "If reasons were plenty as blackberries, I would not give you a reason on compulsion." To demand *good reasons* is a species of compulsion. I can only render such reasons as I have. They may be good, or they may be bad. The jury, the readers of THE OPEN COURT must decide. I might answer from the books, as we answer our adversary's move when we play a game of chess by letter. I find by the books that the reasons for using gold and silver as money are their superior homogeneity, utility, portability, cognizability, indestructibility, divisibility, stability, and ductility. These ought to be convincing, but I have others. For thousands of years all other kinds of money have rendered homage and confessed allegiance to gold and silver for the privilege of circulating as money at all. For ages, all other kinds of money have come to gold and silver to be measured, and to receive their tickets of "ratio." Men instinctively trust in gold as the foundation and basis of all money, and as the safest of all. Their faith in other money rests on gold as its ultimate redeemer, and unless that promise of redemption, appear somewhere about it, all token, credit, promissory, representative, and substitute money stands condemned by common consent. You may demonetize gold by statute, and it will stalk through the marts and markets, lord paramount of money, in defiance of the law. It is natural money by the constitution of commerce, by the common law of the world.

The eighth question demands my surrender to the combined powers known as Agriculture, Manufactures, and Mining. I am not ready to give myself up. I admit that so far as human labor makes the wealth of a nation those three powers give more than others to the aggregate fund, but they do not contribute all. Hunting, fishing, and some other human activities contribute something, and there are agricultural products, manufactured articles, and minerals whose value consists more in the labor of those who distribute them than of those who raise them, fabricate them, or dig them out of the ground. For instance, Nature has established coal cellars in different parts of the country and filled them full of coal. Underground Pennsylvania is one of those coal cellars. Now, the value of that coal up stairs at the mouth of the pit is not only what the laboring miner has given it, but also what the capitalist who sunk the shaft, and the engineers who contrived the means to reach the coal, have given it. The value of it in Chicago is what all those together and the distributors have given it by their joint exertions, and the distributor may have furnished the larger share.

To the ninth question, I answer that the hypothesis appears to me to suppose an impossibility. The last value of an article is the price paid for it by the consumer, and that price includes the reward of everybody who has had anything to do with it. Commerce can get its own share and no more. It cannot get the share of the farmer, the manufacturer, or the miner. If it could, they would consume their own products, and commerce would cease to be. Each of the "three classes" gets the price of its product at the farm, the shop, or the mine. The "wealth distributor" then takes charge of it, and carries it to the dearest market he can find. He charges "whatever the traffic will bear," and the consumer pays it all. The bridge between the original producer and the final consumer may be long or short, and the person who carries the "projuice" over it may be an extortioner, but after all, he cannot get any more than the traffic will bear. That the profits may be more fairly shared by the other "three classes" is the ob-

ject of state railroad-regulations, inter-state commerce laws, and similar contrivances, some of them wise and some of them not. Whatever rate the wealth distributor may charge for his work, it does not follow that therefore the farmer, the miner, and the manufacturer must "go to poverty."

It may be that there is no common agreement between my questioner and me as to what really constitutes money. He may recognize many potencies as money that I reject, and after all, we may be strangers to each other's meaning, like two men trying to converse together in different languages. I remember long ago, when I was meandering through France, how vexed I used to be at the stupidity of the French people, who could not understand their own language when spoken to them by me. So, I fear my questioner may be vexed at my dullness because I do not understand exactly what he means by money.

There are many "circulating mediums" of bad character traveling about as money, and they are doing a very extensive business on false pretenses. Certain substitute money, having served for a time in that capacity, declares itself real money, is recognized as such, and does a great deal of mischief before it can be arrested and suppressed. For this, government is responsible. It has usurped prerogatives and powers that belong to omnipotence alone, and with cheap money it has cheated the poor man out of his wages. It was a daring and arrogant usurpation when governments declared money to be a legal-tender in payment of debts, for by doing so, they made a political standard of honesty, elastic, uncertain, and shifting from time to time. This despotic legislation has thrown the whole system of human dealing into a chaos of moral confusion. Governments declare tobacco, coon-skins, rum, promissory notes, and various other things to be legal-tender in payment of debts, and the consequence is, that the sense of moral obligation is weakened among the people.

I do not mean to say that it is not within the legal province of the supreme power in the state to close its courts to creditors, and declare that certain coon-skins, or other legal tenders, having been offered them, their debtors are free, and their debts paid; but, in the dominion of morals, the act is absolutely void. There justice reigns, and a debt is not paid until the moral obligation it contains is cancelled. Great as this government is, it is not able to pay any man's debt by statute. It may declare the debt expunged, satisfied, wiped out, even "paid," but only the debtor can pay it. The moral confusion in these cases arises from the use of the wrong word, "payment." A debtor, finding that his debts are "paid" by legal force, is apt to think that the moral obligation, as well as the legal obligation, has been discharged by the laws of his country, when, in fact, the moral obligation can be discharged by himself alone. "I owe you nothing," said a dishonest debtor to his creditor, "that note was outlawed last week." In like manner the bankrupt, having passed through the court, thinks that he owes nothing and that all his debts are paid.

It was a fantastic dream of the alchemists that by chemical expedients they might change the baser materials into gold, but it is a more irrational fanaticism that believes in the power of governments to create money that will pay debts. All the resources and skill of the alchemists failed, and there is no political alchemy that can perform this miracle. Right here, perhaps, my questioner and I find ourselves trying to converse together in different languages. He may mean one thing by "money," and I another. Until we can reach a common understanding as to what really constitutes money, we shall have no foundation whereon to build "a sound financial system."

WHEELBARROW.

O virtue, virtue! as thy joys excel,  
So are thy woes transcendent; the gross  
Knows not the bliss or misery of either world.

THOMSON—*Agneumion*.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXV—Continued.

"The ladybird knows your Highness's future," said Ilse. "You should ask it: Ladybird, ladybird, shall I be happy long?—one year, two years? and so forth, till it flies away."

The Prince began the sentence, but had not arrived at the first year when it flew away.

"That does not apply to you," said Ilse, laughing, to console him. "The little creature was angry at me yet."

"I had rather bear the misfortune myself," said the Prince, in a low tone, "than that you should suffer it."

While Ilse, startled at the deep meaning of his words, turned to the ladies, he stealthily picked up the kerchief that had fallen from her shoulders, and, behind a tree, pressed it to his lips.

Still merrier did the young people become, when from the hut behind the bushes two men stepped forth with red-coats and drums, and invited them to try their skill at the popinjay. The Chamberlain took the superintendence of the boys, and Ilse of the girls; foresters and lackeys helped with the cross-bows; the arrows struck incessantly on the body of the bird, for the hitting was made easy, and those who did not win could admire the prizes, which were arranged on two tables. Everything went on smoothly, as is fitting at Court fêtes; the lackeys moved incessantly among the company, with every imaginable refreshment; the splints from the popinjays fell like hail, and the Prince distributed the prizes to the children who thronged round him. Bertha Raschke became queen of tournament, and a little son of the Consistorial Councillor her consort. The children, carrying their presents, followed the drummers with joyous shouts up to a long table, where a supper was prepared for them. They were to sit down with the king and queen in the middle. The foresters and lackeys served the different courses. The Chamberlain could not have devised anything better to please the parents; and the fathers walked behind the chairs and enjoyed seeing the little ones drinking harmless wine out of the crystal glasses, their rosy faces expressing delighted astonishment at the beautiful china and silver dishes. They soon became merry; finally the little Consistorial Councillor proposed the health of the Prince; all the children cried "Hurrah!" the drummers drummed, the music struck up, and the parents stood round thanking the giver of the feast. Ilse brought a garland of wild flowers which the ladies had woven, and begged permission of the Prince to put it upon him. He stood amidst the happy party elevated by the innocent joy of all around him, and by the re-

\* Translation copyrighted.

spectful attachment which was visible on all countenances. He looked at Ilse with silent thanks, and without apparent cause his eyes filled with tears. Again the children screamed out "Hurrah!" and the drums beat.

A horseman in strange livery galloped out of the wood; the Chamberlain, in consternation, approached the Prince, and handed him a letter with a black seal. The Prince hastened into the tent, and the Chamberlain followed him.

The wild flowers had brought the young gentleman no good fortune. The pleasure of the *fête* was over; the company stood in groups about the tent, uncertain and sympathizing. At last the Prince and the Chamberlain came out. While the latter turned to the Rector and to those who surrounded him, Ilse saw the Prince at her side with deep sorrow depicted on his countenance.

"I beg of you to excuse me to the ladies, as I am obliged to depart immediately: my sister's husband has died, after a short illness, and my poor sister is very unhappy." In great agitation, he continued: "I myself knew my brother-in-law only slightly, but he was very kind to my sister, and she felt happier with him than she had ever been in her life. She writes to me in despair, and the misfortune is for her quite inexpressible. Under existing circumstances she cannot remain in her present abode, and I foresee that she must return to us. It is our bitter fate always to be tossed about, never to remain quiet. I know that I shall meet with a similar misfortune. I feel myself happy here,—to you I can confess this,—and I regret to say that this death makes it very uncertain whether I shall ever return. I go to my sister to-morrow for a few days. Pray think of me kindly."

He bowed and retired into the tent, and in a few minutes his carriage was on its way back to the city.

Ilse hastened to her husband, who had been requested by the Chamberlain to act for the Prince. It was immediately determined to break up the party: the children were put into the carriages, and the rest returned to the city in earnest conversation.

Meanwhile Laura feigned illness, and sat in her little sitting-room rummaging about among the old ballads. After the meeting in the village garden she had discovered with dismay that, in her anxiety about the Doctor, she had much diminished her treasure: full a dozen of the best were gone, and thus the tie by which she held the collector's heart fast threatened to come to an end. She had, therefore, not sent anything since the drinking-song. But to-day, when the Doctor had experienced treatment that gave her more concern than it did him, she sought for something to console him.

A heavy step on the staircase disturbed her in the

work of selection. She had hardly time to throw her treasures into the secret drawer before Mr. Hummel was at the door. It was a rare visit, and Laura received him with the foreboding that his coming portended serious results. Mr. Hummel approached his daughter and looked at her closely, as if she had been a new Paris invention.

"So you have a headache, and could not accept the invitation? I am not accustomed to that in my daughter. I cannot prevent your mother from allowing her feelings to affect her brains, at times; but I have a right to demand that your head should, under all circumstances, remain sound. Why did you not accept the invitation to the picnic?"

"It would have been an intolerable constraint upon me," said Laura.

"I understand," replied Mr. Hummel. "I am not much in favor of princes, but not much against them either. I cannot discover that they have greater heads than other people. I am therefore obliged to consider them simply as ordinary customers who are not always number one, neither do they always wear number one goods. Nevertheless, when a prince invites you, with other distinguished persons, to a respectable summer entertainment, and you refuse to go, I, as your father, ask you for the reason; and, between you and me, it shall now be no question of headache."

Laura perceived, from the expression of her father's countenance, that he had some other idea in his head.

"If you wish to know the truth, I will make no secret of it. I am not invited on my own account; for what do these people care about me? It is only as the appendage of our lodgers."

"You knew that when the invitation came, and yet you jumped for joy."

"The idea only occurred to me afterwards when—"

"When you learnt that the Doctor over there was not invited," completed Mr. Hummel. "Your mother is a very worthy woman, for whom I entertain the highest respect, but it sometimes happens that one can screw a secret out of her. When you thus ruminate over what neither your father nor the world should know, you should confide it to no one, either in our house or in any other."

"Very well," said Laura, with decision; "if you have discovered it, hear it now from me. I am a plebeian just as much as Fritz Hahn is; he has been in the society of those Court people more frequently than I; their taking no notice of him made it clear to me that they considered one who is his equal as a superfluous addition."

(To be continued.)

## BOOK REVIEWS.

DE LA CLASSIFICATION DES SCIENCES. ETUDE LOGIQUE. By Adrien Naville. Geneva & Basle: 1888. H. Georg. 1 fr., 50c.

The above is an interesting treatise of limited scope upon the important and fundamental question of the classification of the sciences. Mr. Adrien Naville is professor at the Academy of Neuchâtel and is known, apart from other publications, as the author of "*Julien l'Apostat et sa Philosophie du Polythéisme*." Mr. Naville finds the starting-point of a logical classification in these three natural groups: (1) The sciences of the *real*, or sciences of things that exist—History; (2) The sciences of the necessary conditions of the *possible*, or the sciences of laws—Theoretics; (3) The sciences of the *ideal*, or the rules of activity. The successive treatment of each of these three subdivisions is marked by clearness, ease of development, and even a certain grace of literary execution. One finishes this little pamphlet of forty-six pages with the sense of having unconsciously experienced a clarification of ideas in its reading, and we regret that lack of space prevents us from entering into a critical discussion of Mr. Naville's analysis. We may recommend it to our readers as uniting the charm of lucid expression with the more solid merit of logical consistency.

HISTORY OF THE REFORMATION. By Philip Schaff, Professor of Church History in the Union Theological Seminary, New York. New York: 1888. Charles Scribner's Sons.

The author has done a meritorious work in presenting the History of the Reformation to American readers. He makes many investigations from German and other sources accessible, and his ideal enthusiasm for the subject adds a peculiar charm to the book. Prof. Schaff has gone to Europe repeatedly; he searched the libraries for information and visited the classical localities not only where Luther, Zwingli, Calvin, and Knox lived and preached, but also those places where their antagonists, the Pope Leo, Philip II, Ignatius, Loyola, etc., breathed the air of Romanism.

Prof. Schaff correctly says: "The Reformation of the sixteenth century is, next to the introduction of Christianity, the greatest event in history. It marks the end of the Middle Ages and the beginning of modern times. Starting from religion, it gave, directly or indirectly, a mighty impulse to every forward movement, and made Protestantism the chief propelling force in the history of modern civilization."

The Reformation is not only a restoration of early Christianity, but also the inauguration of modern Christianity. And the great movement is not yet closed. Prof. Schaff justly states that "*The Kultur-Kampf* is still going on." He recognizes that the nineteenth century is eminently (like the time preceding the Reformation) an age of discovery and invention, of enquiry and progress.

"And both then as now the enthusiasm for light and liberty takes two opposite directions, either towards skepticism and infidelity, or towards a revival of true religion from its primitive sources."

"The spirit," Prof. Schaff says, "and aim of evangelical Protestantism is best expressed by Paul in his anti-Judaistic Epistle to the Galatians: 'For freedom did Christ set us free; stand fast, therefore, and be not entangled again in a yoke of bondage.'"

We see the progress of the Reformation almost exclusively in this spirit of freedom. Not so our author; and it is here where we cannot follow, but must let him go his own paths. He sees little difference between Romanism and Orthodox Protestantism, and he is right. "What unites them is far deeper, stronger, and more important than what divides them \* \* \* and so the war between Protestantism and Romanism will ultimately pass away in God's own good time." Prof. Schaff is an Orthodox Protestant. He is broad, but not free from dogmatism. He says: "Facts must control dogmas, and not dogmas facts. Truth, the whole truth,

and nothing but the truth, is the aim of the historian; but truth should be told in love."

But nevertheless our author condemns "Rationalism" and seems to be in full sympathy with Luther's invectives against reason. "In his trials and temptations Luther clung all the more mightily to the Scriptures and to faith which believes against reason and hopes against hope. 'It is a quality of faith,' he says in the explanation of his favorite Epistle to the Galatians, 'that it wrings the neck of reason and strangles the beast, which else the whole world, with all creatures, could not strangle. But how? It holds to God's Word, and lets it be right and true, no matter how foolish and impossible it sounds. So did Abraham take his reason captive and slay it, inasmuch as he believed God's Word, wherein was promised him that from his unfruitful and as it were dead wife, Sarah, God would give him seed.'"

Luther called reason "the mistress of the devil," "the ugly devil's bride," "a poisonous beast with many dragon's heads," "God's bitterest enemy," and said "that reason has been and ought to have been drowned in baptism." We must add that Luther's vehement denunciations will be better understood if we consider how they had been provoked. Luther opposed the subjectivity of the *Bildertürmer*, *Schwärmgeister* and *Sacramentirer*, also that of the schoolmen and their Aristotelian subtleties. All these people relied upon reason or upon their own subjective conviction or inspiration. Luther's idea of Christian freedom was not at variance with obedience and objective order. Similarly, Kant's idea of autonomy and freedom of will is ultimately found identical with universal law in spite of all its objective reality and rigidity. Luther himself reasoned on the scriptures very freely, and his criticisms (notably interpretations) are often arbitrary. But he had no patience with men who as a matter of principle identified freedom and anarchy.

Our main objection to the author was stated to be his orthodox standpoint. This fact bears most unfavorably upon the presentation of the subject in that it weakens the scientific spirit of enquiry. He speaks of Reformatory Ages as being "ushered in by a providential concurrence of events and tendencies of thought." The historian has to trace the inner necessity of human development, and to attribute any great accomplishment or progress of humanity to "the design of Providence" must be characterized as an uncritical and unscientific standpoint. If the orthodox views of the author were less pronounced, his book would undoubtedly gain a much larger circle of readers.

P. C.

## NOTES.

Prof. Dr. Alfred Weber, the author of *Die Religion als Wille zum Ewigen Leben*, remarks, in a private letter, relative to the review of his pamphlet published in No. 54, of THE OPEN COURT, as follows:

"Regarding the wish expressed at the conclusion of your review, let me say that my pamphlet is intended as a purely psychological, and not as a metaphysical, study. The theologians and philosophers, who have broached their opinions in such profusion upon the 'Nature of Religion,' tell us, as a rule, what religion *should* be; I meant to tell simply what it *is*—the *real*, the existing religion. 'Our investigation has to do with *real* religion only,' are the express words I use on page 22. But, of course, I intimate thereby—a fact that is perhaps sufficiently known to you through former publications and disquisitions, and which constitutes the fundamental idea of my treatise entitled *L'Economie du Salut, Etude sur le Dogme dans ses Rapports avec la Morale*—that for me, too, an *ideal* 'religion' exists; the religion that the Christian aspires to, but never fully or completely reaches on this side of the threshold of death (*ibid.*). In the place of *Horror* it puts (in so far as it is sentiment) *Amor*; in the place of dualism (in so far as it is a conception), monism; in the place of a priesthood (in so far as it is a cult), the practice of Samaritan precepts.

## A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

CHAS. W. SMILEY, Publisher,

Box 630, WASHINGTON, D. C.

Mr. GEO. WILLIS COOKE will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. Cooke's address is DEDHAM, MASS.

## WANTED!

An energetic and educated person wanted in every town, city and district, to canvass for subscriptions to THE OPEN COURT; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,

Box F., Chicago, Illinois.

Henry J. Ennis,

Attorney and Counsellor in Patent Cases.

Rejected and Complicated Cases a Specialty.

Office: Lenox Building,

WASHINGTON, D. C.

(Opposite the U. S. Patent Office.) P. O. Box 442. Patent Business Exclusively.

## Recent Contributions to 'The Open Court.'

PROF. WILLIAM D. GUNNING.

A Memorial Address by Frederic May Holland.....In No. 61.

Prof. William D. Gunning died at Greeley, Col., on the 8th of March, 1888. His active and exemplary career of sixty years was devoted to the advancement of scientific thought, and marked by an uncompromising loyalty to truth. The memorial address, by Mr. Frederic May Holland, is a just and fitting tribute to a noble life.

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55, 56 and 57.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays will be published at the conclusion of the series.

The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbecomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion.

The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

## THE FOUNDING OF OUR RELIGIOUS FREEDOM.

By MONDREU D. CONWAY. In No. 52 and 53.

Mr. Conway here discusses a subject that the present Centenary Era renders timely and interesting. The glorious immunities of civil liberty that our ancestors wrested from the grasp of feudal traditions and confirmed by constitutional bulwarks, were attended perhaps with greater brilliancy and marked by greater effort of acquisition; but, from the standpoint of individual freedom, liberty of conscience and the principle of religious toleration rank not below them in importance. Mr.

Conway's story is drawn from unpublished sources, from private manuscripts, and is in the main the result of original research. The state of the Church of England in Virginia, the apostolate of Samuel Davies, the religious tendencies of colonial society, the religious profession of men to become so famous in history, of Randolph, of Patrick Henry, of Madison, and of Jefferson—are all described and discussed, and the manner told in which both the institutions and the men of that era affected and influenced the founding of religious freedom in the United States. The new light which Mr. Conway's research throws upon this important chapter of American history, will be welcomed by all.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNER.....In Nos. 37, 41, and 43.

An essay full of fine thought and psychological depth. Carus Sterner well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In Nos. 47, 45, and 46.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## REFLEX MOTIONS.

G. H. SCHNEIDER.....In No. 24.

G. H. Schneider's book, *Der Menschliche Wille*, is one of the most prominent delineations of modern psychological research. The essay on Reflex Motions is a translation of the basic chapter of Schneider's work. It contains the fundamental propositions of physiological psychology.

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.

Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is here made of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with THE OPEN COURT, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## THE INDIVIDUALITY OF ATOMS AND MOLECULES.

REV. H. H. HIGGINS M. A. In Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *bios*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesis endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problem of Memory."

### WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to *The Open Court*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,

Box F., Chicago, Illinois.

Henry J. Ennis,

Attorney and Counsellor in Patent Cases.

Rejected and Complicated Cases a Specialty.

Office: Lenox Building,

WASHINGTON, D. C.

(Opposite the U. S. Patent Office.) P. O. Box 142. Patent Business Exclusively.

Mr. Geo. Willis Cooke will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. Cooke's address is DEONHAM, MASS.

Three Introductory Lectures

—on—

## The Science of Thought.

(First published in *The Open Court* of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

"Full of novel thought."—*Chicago Herald*.

"The subject is discussed with great clearness and simplicity."—*Book Chat*.

"The absurdity of the theory is manifest."—*New York Science*.

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.

"Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.

"The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

### THE LEADING ORGAN

of British Thought on the American Continent

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

T. R. CLOUGHER, Business Manager,  
TORONTO, ONT.,  
or J. WALTER THOMPSON, (Times Building),  
NEW YORK.

# THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING COMPANY.

CHICAGO, ILL.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE READER will find in *THE OPEN COURT* an earnest, and, as we believe, a successful effort to conciliate Religion with Science. The work is done with due reverence for the past and with full confidence in a higher future.

*THE OPEN COURT* unites the deliberation and prudence of conservatism with the radicalism of undaunted progress. While the merits of the old creeds are fully appreciated, their errors are not overlooked. The ultimate consequences of the most radical thought are accepted, but care is taken to avoid the faults of a one-sided view.

## THE QUINTESSENCE OF RELIGION

is shown to be a truth. It is a scientific truth (a reality) which has been and will remain the basis of ethics. The Quintessence of Religion contains all that is good and true, elevating and comforting in the old religions. Superstitious notions are recognized as mere accidental features of which Religion can be purified without harm to the properly religious spirit.

This idea is,

## FEARLESSLY AND WITHOUT RESERVATION OF ANY KIND.

presented in its various scientific aspects and in its deep significance to intellectual and emotional life. If fully grasped, it will be found to satisfy the yearnings of the heart as well as the requirements of the intellect.

Facts which seem to bear unfavorably on this solution of the religious problem are not shunned, but openly faced. Criticisms have been welcome, and will always receive due attention. The severest criticism, we trust, will serve only to elucidate the truth of the main idea propounded in *THE OPEN COURT*.

*THE OPEN COURT* holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of *THE OPEN COURT*.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Monism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the eternal laws of the All.

The work of *THE OPEN COURT* covers a wide field of study and intellectual enjoyment, embracing the whole domain of Moral Philosophy, of Religion, Social Economics and Science. While speculative thought is allowed its proper place in the search after truth, all claims are brought as close as possible to the test of scientific analysis and proof. The articles have been selected carefully from a large number contributed by some of the most eminent men known to the literary world of America and Europe. The translations of the German and French authors have been made by competent scholars, and these translations form a valuable connecting link between the latest philosophic thought of the Old World and the New.

TERMS, \$2.00 PER YEAR. \$1.00 FOR SIX MONTHS.  
\$0.50 FOR THREE MONTHS. SINGLE COPIES, 10 CTS.

All communications should be addressed to

THE OPEN COURT,

(Nixon Building, 175 La Salle Street.)

## RECENT CONTRIBUTIONS TO "THE OPEN COURT."

### THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55, 56, 57, and 58.

Mr. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into microscopic life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling, in proto-organisms is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The correspondence elicited in France by these essays is published in No. 67.

The essays will be published during the month of January, 1899, in book-form; parts that have not appeared in *THE OPEN COURT*, with new explanatory cuts, and a preface especially written by the author, will be added.

### TRANSFORMATION AND ADAPTATION IN SCIENTIFIC THOUGHT.

PROF. ERNST MACH. .... In Nos. 46 and 48.

Ernst Mach, Professor of Mechanics at the University of Prague, author of several works explanatory of the history and philosophy of mechanics, and the first authority in his branch, discusses in this essay an idea that conditions the development of modern scientific thought. The article was delivered as an address by Prof. Mach upon assuming the rectorate of the University of Prague.

### ORIGIN OF REASON.

LUDWIG NOIRÉ. .... In No. 33.

An essay of great importance; will greatly help to explain the views of Max Müller. The same number contains an editorial upon *Monism* and Philosophy, in which is discussed the Identity of Language and Thought, the theories of Noiré and Müller, and the proof with which modern philology has corroborated the monistic conception.

### THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

By S. ARTHUR STRONG. .... In No. 63.

An instructive essay upon the purposes of the Hibbert Foundation, with a review of the recent lectures by Prof. John Rhys upon the religion of the ancient Celts. The original investigations of Prof. Rhys have thrown a new and welcome light upon the forms of belief in ancient Gaul, Wales, and Ireland, and they are regarded as a monumental work in the province of philological archaeology.

### CHRISTIANITY AND RELIGION.

By DR. GUSTAV CARUS. .... In No. 70.

Dr. Gustav Carus, Superintendent General of the State Church of Eastern Prussia and one of the most prominent clergymen of Germany, criticizes the work of *THE OPEN COURT*. The principles of the monistic and melioristic philosophy are discussed in their relation to Science and Christianity. The criticism is pervaded by an earnest, thoughtful, and religious spirit.

In the same number, under the title "The Religious Character of *Monism*," appears an editorial

reply to the above criticism. The position of *THE OPEN COURT* is defended, its tenets justified, and its principles more fully explained.

### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.

FELIX L. OSWALD, M. D. In Nos. 27, 29, 31, 33, 34, 36, 38, 40, 42, 44, 46, 48, 51, 53 and 57.

The Science of the thousand-fold moral effects of physical causes is still a sealed book to a large plurality of our fellow-men. The ethics we have inherited is biased by the tenets of an anti-physical and anti-natural philosophy, and the tendency of the latter has ever been to sanction and exaggerate the physical effects of moral causes. Dr. Oswald says: "Our entire system of moral education needs a thorough revision, and the success of urgent social and ethical reforms depends on the radical reconstruction of moral philosophy on a basis of natural science." The subject is treated in the graphic manner which has ever characterized Dr. Oswald's contributions to the Literature of Natural History and Anthropology. It is marked by the usual wealth of illustration and abounds in felicitous and pertinent citations of historical and natural evidence.

### THE UNIVERSAL FAITH.

By T. R. WARREN. .... In No. 71.

### THE FOUNDER OF THE NINETEENTH CENTURY CLUB.

By MORGUE D. CONWAY. .... In No. 71.

Two important and interesting articles upon the life, work, and influence of the late Mr. Courtland Palmer, of New York, the liberal and high-minded founder of The Nineteenth Century Club.

# THE OPEN COURT.

## WHAT MIND IS.

PROF. E. D. COPE.....In No. 40.

## THE NATURE OF MIND.

By THE EDITOR OF THE OPEN COURT. No. 40  
Professor Cope gives in clear and comprehensive outlines his view of mind; he opposes Materialism and Dualism, stating that "the situation is monistic." However, "as the amount of thought can most assuredly be measured, but the quality of thought can not," the eminent American scientist concludes that "consciousness has a field of its own where it ranges free from the bonds of energy." The directive element (will and mind) is qualitative not quantitative and controls the movements of the non-mental environment. "This statement may be called occultism," Prof. Cope adds, "and I suppose justly. But such is the fact."

In opposition to Prof. Cope, the Editor explains his view of mind. The qualitative faculties are a matter of form. Form is the essential characteristic of mind, and a superior mind indicates a superior form of brain structure. Form is an abstraction from reality and has by itself no efficacy. M. Ribot, the founder of the French school of experimental psychology, is quoted in support of the fact that consciousness by itself is not an effective factor in the motion of our limbs. "The consciousness of mental states may be indispensable for a proper direction of our will, but it does not possess motive power. Prof. Cope's view is considered inconsistent because leading to dualistic statements and to occultism."

A letter from Prof. E. D. Cope, which has reference to this discussion, is published in No. 42.

## FREE-WILL A MECHANICAL POSSIBILITY.

XENOS CLARK.....In No. 39.  
Mr. Xenos Clark here presents in an interesting and attractive manner certain scientific analogies bearing upon Free-Will and Determinism. A novel and ingenious application is here made of the theory of linkages and link-work which of late has so interested mathematicians and been developed with such striking success by Prof. Sylvester. The article will be found to be unusually suggestive, although it is not in concord with *The Open Court*, which, in an editorial of No. 33, admits the truth of both *Free-Will* and *Determinism*.

## THE FUNDAMENTAL PROPERTIES OF MATTER.

J. G. VOGT.....In Nos. 29, 31, and 34.

To the kinetic conception of the world's mechanism Vogt opposes his hypothesis of a continuous world-substance completely filling space and whose sole manifestation of power consists in contraction or condensation. He claims that the kinetic or mechanical theory, which explains organized and spiritual phenomena from inelastic atoms and a purposeless force, is untenable; and that pseudo-morphism, which transforms the most complex conditions and processes of physical life into the elementary substance itself, involves the fallacy of idealism and dualism. As opposed to both views Vogt propounds his conception, which he calls Monism of Reality. He attributes to matter two fundamental properties, motion and sensibility, and deduces from these elementary properties the higher phenomena of intellectual life.

## ETHICS AND PUBLIC LIFE.

W. M. SALTER.....In No. 45.

The well-known lecturer of the Society for Ethical Culture in Chicago bravely probes the wounds of our public life and shows his patriotism by boldly denouncing the evils and wrongs of American politics. But he is no pessimist; he does not despair of improvement and progress. He knows very well that men "of Roman virtue" still exist. Mr. Salter wants to elevate our conception of politics, so that the best men in the community would lose their repugnance to public life; that they would enter it once more to make it great and illustrious.

## THE PROBLEM OF CAUSALITY.

In No. 35 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbekomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion. The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

The comments and discussions elicited by the article on "Causality" will be found to be especially instructive and elucidative. In Nos. 58, 59, and 60, Mr. William M. Salter advances a series of critical remarks, which are replied to in the same numbers by the articles, "Causes and Natural Laws" (No. 50), "Is There Anything Unknowable in Causation" (No. 59), "Is Nature Alive," and "The Stone's Fall" (No. 60). In No. 58, Mr. M. A. Griffen writes a letter upon the same subject; in No. 60, Dr. Edward Brooks, of Philadelphia comments upon the standpoint taken: all of which are accompanied by editorial comments.

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

MRS. EDNAH D. CHENEY.....In Nos. 49 and 50.

In Nos. 49 and 50 *THE OPEN COURT* publishes a paper upon Mr. Alcott's conversations, read by Mrs. Ednah D. Cheney before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1840. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

## DETERMINISM VERSUS INDETERMINISM.

PROF. GEORG VON GIZECKY.....In Nos. 25 and 26.

Georg von Gizecky is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject have been published from E. P. Powell and Xenos Clark.

## THE BASIS OF ETHICS.

### THE SOUL.

### FREE TRADE AND PROTECTION.

By EDWARD C. HEGELER.....In Nos. 1, 15, and 62.

## THE FIELD-INGERSOLL CONTROVERSY

An editorial discussion of the Field-Ingersoll Controversy and of Mr. Gladstone's Remarks upon the same, will be found in Nos. 43 and 44. The questions and issues involved are treated from an independent and impartial standpoint. The inefficacy of Agnosticism to approach a solution of the religious problem is shown; Agnosticism being but a negative view of the world. The true position and significance of both parties in the development of the religious idea are pointed out and each is recognized as important and necessary to the ultimate synthesis of religious truth, a religion which will in due time be good in all.

## ECONOMIC CONFERENCES.

WHEELBARROW.....In Nos. 37, 40, and 47.

The Economic Conferences of Chicago may be hailed as a significant indication of a breach in the barrier between Labor and Capital. The conferences have served as a medium for the open exchange of opinion, where both sides are fairly represented. Wheelbarrow's criticisms are acute and pithy, and merit a careful perusal. The author unites Old Saxon simplicity, sincerity of heart, the truthfulness of honesty and warm sympathy for justice and right.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNER.....In Nos. 37, 41, and 43.

An essay full of fine thought and psychological depth. Carus Sterner well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## THE SPIRITUALIST'S CONFESSION.

By MONCURE D. CONWAY.....In No. 65.

An interesting article upon the recent confession of the Fox Sisters at the Academy of Music, N. Y., with a short historical sketch of the Spiritualist movement in America and England.

## PLANTATION FOLK-LORE.

L. J. VANCE.....In Nos. 41, 45, and 46.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## PUBLICATIONS OF "THE OPEN COURT."

### Three Introductory Lectures

—on—

## The Science of Thought.

(First published in *THE OPEN COURT* of June, July, and August, 1897.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
  2. The Identity of Language and Thought; and
  3. The Simplicity of Thought.
- With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

## The Marriage Problem.

By E. D. COPE, Ph.D.

PRICE, 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.

PRICE, 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Etheism, the Monistic Conception of God.

Single Copies, 10 cts.

## FREE TRADE OR PROTECTION.

BY EDWARD C. HEGELER.

Discussions of political questions have hitherto not been introduced into our journal; but it is obvious that the burning questions of the day must be judged from ethical principles also. It would be wrong not to declare openly what appears to be the right solution of the most practical and important affairs of public life.

Looking at the question of Free Trade or Protection from the religious or humanitarian standpoint, I think that all the different religious creeds agree in this, that the ideal of our efforts must be a higher humanity.

What are higher men?—Men more moral, in the sense generally used, more intelligent and efficient, more skillful in every respect, more civilized, more able in the pursuits of peace as well as war.

How do we produce such men? Shall we realize our ideal by protection, by restricting other nations from competing with us, by taking advantage of temporary international circumstances? I think not. Experience shows that competition is the foundation of progress, including competition in labor, which, however, is kept in bounds by the laborers' striking in order to preserve a certain standard of living.

From this point of view we must give equal chances to all the people of the earth, demanding the same from them in return. When, in 1858, we sent Commodore Perry's fleet to Japan, to open commerce with that country, which from necessity was done with arms in hand, we told the Japanese: "You have no right to exclude us from the soil you hold, you must allow interchange of products, that is commerce, with us. But we will give you an equal chance with us." The principle of this policy was truly ethical. Our people here were benefited thereby, and more so the Japanese, who, after a long protection-stagnation, have entered on a new era of progress.

Though we may now be ahead of the European nations in many industrial pursuits, we must in time linger behind them through the permanent use of the infant's nursing bottle of protection. If we permanently shut ourselves up by a Chinese wall of protection, would

not the European nations, if by and by they settle their internal disputes, have the right to speak to us, as we did to the Japanese? And shall we wait for such an admonition?

I expect that our descendants will then stand up and defend the national honor against such demands. But we will have to fight for a cause that is wrong from the standpoint of a higher humanity. And a constant preparation for such emergencies will make our country a military camp, as is Europe, with all its poverty-producing effects.

Protection is wrong in the humanitarian sense and leads to hostile feelings and war in place of good will and peaceable interchange. The civilized people of the world, in the interest of a higher humanity, ought to compromise their minor differences and with united efforts fill the earth with civilized men.

But I hear the question: "Must we not protect our workmen from European pauper labor?" I ask, is it right that we call and treat as paupers the workmen of those nations whose descendants we are, the native Americans as well as those of foreign birth? And this we are brought to by the protective policy. This policy is wrong by the general ethical law to which philosophy leads, and which is: "Aspire to a higher humanity." We are here in full concord with the old religions. The fourth commandment of the Mosaic law says: "Honor thy father and thy mother that thy days may be prolonged and that it may go well with thee in the land which the Lord thy God giveth thee." And the New Testament says: "Thou shalt love thy neighbor as thyself." These teachings should not only refer to individuals, but afford the soundest foundation also for the international morals of our nation toward our mother-countries. My answer to the above question is: "Our workmen, if we select the right kind of labor, whereto we are most favored by nature, will not be degraded by the labor of the European workman with his economical habits; on the contrary, they will have the benefit therefrom."

Entering now upon the patriotic side of the question, it is our duty, to place the welfare of our whole nation above that of our narrower interests.

Recognizing the wholesome influence of a free

competition with others, we should, from an ethical point of view, consider as beneficial progress every step that brings us (without the recklessness of too sudden changes) nearer to the state of free-trade. Having been requested by the *La Salle Democrat-Press* to explain my views on the tariff question, I have stated them in a letter to the editor of that journal. A copy of the letter is here presented to the readers of THE OPEN COURT.

*Editor LaSalle Democrat-Press:—*

Upon your invitation to give you my views on the issues of the political campaign, I write what follows.

The Democratic party enters upon a policy of reduction of taxes on imports, alleging that the money which is not needed for the economical administration of the government should remain in the pockets of the people. President Cleveland says that too much money in a government's hands has a demoralizing effect upon it.

The Republican party opposes that policy. They will continue to collect the taxes and spend the surplus for unascertained purposes. They say that the reduction of taxes on imports will put our workingmen on a footing with European workingmen—exposing them, it is said, to competition with "European pauper labor."

Let me briefly express my opinion as to the effects of a general reduction of the tariff upon the industries of our country.

*Effects on the Non-Protected Industries.*—The farmer, after a while, will thereby get a higher price for his products—his corn, his cattle, and his hogs. Why? In consequence of a reduction of the cost of transportation East. The reduction of the cost of transportation will follow upon a reduction in the cost of steel rails and railroad-material. In time, too, if railroad employees should be willing to work for less money, consequent upon the reduction of living expenses, that also would help to reduce the cost of transportation.

Such willingness, however, on the part of railroad employees to accept less wages is not to be looked for very soon, for the increased prosperity of the farming interest would be an inducement to abandon railroad-ing for farming, or for such other occupations as directly share the prosperity of the farming interest and together with that are only injured by the tariff. Such occupations are those of the blacksmith, brick-maker, butcher, brewer, carpenter, carriage-maker, clock-maker, coal-miner, cooper, day-laborer, machinist, mason, painter, printer, stone-cutter, teamster, tinner, watch-maker, wheelwright, and nearly every calling pursued throughout the land. And not only will the prosperity of agriculture prevent the lowering of wages

of railroad men by offering them better advantages, but even the railroad interest itself will be able now to do the same. Railroad-ing will directly share the prosperity of the farming interest; as there will be more goods to transport. There will follow an increased demand for new railroads.

Lower wages can only come as the result of a large immigration drawn hither by the offer of plenty of work, together with a lower expense of living than at present obtains. Wages in Europe are at present higher than they formerly were; and besides there are there, as here, organizations for maintaining and increasing wages. European workmen, no doubt, could now easily raise sufficient funds to enable them to come over here in much larger numbers than they actually now do, if they saw a reasonable certainty of improving their condition thereby.

The present difference between American wages and European wages *must* be accompanied by a definite outlook for steady work, as an inducement; otherwise the risk of emigrating will not be run. In the old land workmen can procure many necessities of life, luxuries, and higher enjoyments, at a much lower cost than they can be got here. And then, man does not so easily separate from his native land and all that is dear to him therein, unless with the prospect of substantially improving his condition.

So I expect that wages in general would not be lowered even by a large reduction of the tariff for a good while; and certainly not the wages of those employed in industries that, practically, are not now protected: and the majority of industries are not protected, although their products may be on the tariff-list.

In farming and the non-protected industries I am therefore confident that a reduction of tariff will be a substantial gain to both employers and employed.

I have already shown how much the reduction of the tariff would benefit the farmer in the sale of his products. But his gain would be equally as much, if not more, in what he buys. And this advantage the people generally would have. The farmer would be able to buy most things that he needs at a much lower rate—most things except labor, and labor can be made cheaper only by a large immigration drawn hither by the workingman's condition being better here than it now is.

The largest industry of our neighborhood, next to farming,—the coal-mining industry,—has no benefit from the tariff. Coal will never be brought from Europe to the West. The cost of transportation of coal from the mines to the consumer, as well as the cost of tools, machinery, and lumber, is increased by the tariff, and so are the living expenses of all engaged in the mines. The same is true also of the plow-factory and the clock-factory.

*Effects on the Protected Industries.*—How is it with regard to our protected industries, locally our zinc and our glass manufactures?

#### GLASS-MANUFACTURE.

With the glass-making industry I am but little acquainted, but am under the impression that the individual interests of men specially skilled in glass-manufacture, for instance the glass-blowers, who are not likely to use their skill in other branches of industry, will suffer by the reduction of the tariff on glass. The business may, for a time, be depressed. But such a depression is likely to be only temporary, for, with the increase of the general prosperity of the country that must follow upon a reduction of the tariff, the demand for glass must become greater; so that our inland glass-works will be able to sell their products nearer home, while the foreign glass-works will have to pay the cost of transportation to their ports, the freight across the ocean, the insurance, the freight from our coast to the inland consumer, and also what remains of the tariff to meet the expenses of the government.

#### ZINC MANUFACTURE.

How is it then with regard to our zinc industry? The prices prevailing in the manufacture of zinc, have for a number of years been ruled by existing home competition, and fear of more competition. There are no trusts.

Those connected with the mining of zinc ore, namely, the miners, mine-operators, and mineral-land owners, all well know that the market price of the ore directly fluctuates with the prices of zinc. If the tariff on zinc is reduced, this reduction will fall altogether on the prices of zinc-ore, as it is not likely that the wages in zinc-manufacturing will decline, for a reason already given; namely, that the greater profits (consequent upon the reduction of the tariff) of such pursuits as now suffer by the tariff, will attract workingmen to those pursuits, and thereby prevent a fall of wages in protected industries.

Against this, the probable reduction of the cost of transportation of the zinc-ore from the mines to the smelting-works and the reduction in the cost of transportation of manufactured zinc to the East, will be somewhat of an offset.

Also, if an increase of the general prosperity of the country shall materially increase the inland consumption of zinc, the zinc mined and manufactured here will find its market inland. And supposing sooner or later a large reduction of the tariff, this inland market-price will be the price of foreign zinc, with the remaining duty and the cost of transportation from the coast to the interior added; assuming the coast-cities to be supplied with foreign zinc.

I conclude, therefore, that while the reduction of the tariff on zinc will fall on the price of zinc-ore, the

above-mentioned causes will, if not immediately, yet in the long run, make up a good part of the loss.

What will be the effect of lowering the prices of zinc-ore? The quantity of zinc-ore mined must, for a time, be expected to be materially reduced, as it will not pay to run inferior mines, and as miners and their help are not likely to work for lower wages, with the increased profitableness of other industries, such as farming, coal-mining, gold and silver-mining, all of which suffer by the tariff.

As a consequence of the decreased supply of zinc-ore a portion of the zinc-smelting works, or parts of such works, would be compelled to remain idle for longer periods than is now the case; but this would be only transient, for, as already explained, the increased inland demand for zinc would again raise its price.

#### WHO ARE THE LOSERS?

In view of a general and material reduction of the tariff, who are the real losers (if there are any such)? These, in my opinion, are the employing manufacturer, the mine owner, and particularly the owner of the mineral land, together with such workmen as will, for a time, suffer on account of the temporary idleness of zinc-smelting works, or parts thereof, and are therefore compelled to seek for other work, of which, it is likely, there will be plenty.

In the end also, the capitalistic part of the zinc-industry, that of the mine-owner and of the manufacturer, will be put on a healthier basis than it now occupies. The capitalist now hesitates to make substantial improvements, as he fears that the present high tariffs can only last until the farming and non-protected industries find out that the protected industries are a burden to them.

What I have here argued has reference to a large reduction of the tariff, not the beginning of a reduction, as proposed in the Mills Bill. Instead of opposing a moderate reduction of the tariff, such as is proposed by this bill, we—I mean employers and employed, engaged in a protected industry—ought to be thankful, if the reducing of the tariff is done gradually; unless we are sooner or later to draw down upon us the wrath of the non-protected industries, when the latter have found out more definitely than at present, that for years they have been misled—by many well-meaning men, I allow.

#### THE ETHICAL ARGUMENT.

America is a land favored by nature with a fertile soil, under a temperate climate. A century ago this land was largely the hunting-ground of the wild Indian, and two centuries ago it was so almost altogether. Within these periods the workingmen of Europe came over and settled here, leaving behind them brothers, kindred, and friends in their overpopulated

native land. The descendants of European workingmen who came over fifty years or more ago, are now the native Americans of to-day. We workingmen of the West, to a large extent, came over here ourselves, leaving the land that gave birth to the kindred and friends we left behind us as well as our own selves. Is it right then, that we should say to them: We must be protected from your *pauper* labor! Is not the right way this? That we in our land carry on, in the first place, those pursuits to which nature offers the most favorable opportunities,—which are primarily the production of food,—and exchange that with them for the products of their toil, and so benefit them as well as our own people.

Shall we, through protection, bring up a race of industrial weaklings, fearing an open competition on our own soil with European workingmen, who pay higher prices than we do for food, and who have to pay also for sending over here the products of their toil?

The reader of my argument need not be told that I shall vote for Grover Cleveland and Allen G. Thurman, who, I may say, are, both of them, men fit to be entrusted with the responsibilities of high offices. And for a like reason I shall vote for General Palmer, of whose character, tested ability, ripened and far-sighted views, I hold the highest opinion.

Respectfully yours,

*Edward C. Hegeler.*

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.  
*Part XVI.*

#### SOIL AND CLIMATE. (Continued.)

The Unity of Nature, in the manifestations of her highest and lowest laws, is strikingly illustrated in the analogies of human and animal biology. Naturalists have demonstrated the agency of a chief factor in the progress of evolution from the unmistakable contrasts of continental and insular forms of organic life, and a curiously similar kind of physical influences can be traced in the contrasting types of national development. Several island regions of this planet seem to have tarried behind the general advance of organic evolution. They exhibit a fauna and flora all of their own, as compared with the living forms found in less isolated parts of the habitable globe, but which at the same time bear a remarkable resemblance to the plants and animals of earlier geological periods. Madagascar, for instance, with its vast extent of tropical forests, contains not a single species of monkeys, no kind of antelope, no elephants and giraffes, not even a squirrel, but not less than thirty-five different species of lemurs or night-apes, five peculiar varieties of

carnivora and three species of insectivorous mammals, all of which have become extinct on the main-land of Africa, where their ancestors were ages ago superseded by other and generally more highly developed species of kindred animals.

For undoubtedly similar reasons the superstitions of primitive social institutions of former centuries have held their own among isolated nations, dwelling, as it were, at a distance from the highways of international commerce and less apt to profit by the experience of their civilized neighbors. In Europe, for instance, the stream of international travel reaches its highest water-mark in western Germany, its lowest probably in eastern Portugal. Aside from questions of political and industrial development, we accordingly find in the intellectual progress of those regions a contrast representing a difference of about seven centuries. For one traveler who carried a leaven of skepticism and helpful suggestions to the Portuguese province of Trás-os-Montes, fifty thousand at least visited Alsace and the valleys of the lower Main and Rhine, and the result is seen in the mental status of the Rhineland and East-Portuguese varieties of the Caucasian Race. Within a hundred miles of Frankfort on the Main, a professed believer in witchcraft could not escape the lunatic asylum for twenty-four hours. An attempt to enforce the Sabbath laws of the Scotch kirk-despots would result in an immediate revolution. A papal interdict of any special book would increase its sale about a thousand per cent. Hereditary rank has so utterly ceased to constitute a claim to social prestige that counts and barons cannot hope to assert their prerogatives outside of the army, and have come to consider their titles a positive disadvantage in the competition of intellectual or political life. Even in the smaller communities the expenses of sanitary improvements are defrayed by voluntary contributions. Every school has a free gymnasium and a free circulating library. Freethought is no longer an obstacle to official preferment, and religious persecution would promptly recoil upon the heads of its instigators. Inhumanity is not tolerated even in prisons; cruelty to animals cannot be openly practiced with impunity. Landed proprietors vie in extending the culture of forest-trees, and the woods of the highland districts are protected by the vigilance of special government officials. Attendance at school increases, attendance at mythological establishments decreases from year to year.

An analogous change is going on in eastern Portugal. The Cantabrian Mountains have not wholly barred out the influence of European civilization, and the public burning of a freethinker would probably prevent the further promotion, and might lead to the enforced resignation, of the responsible officials. The number of schools has increased, but so slowly that in

\* Copyrighted.

the district of Braganza (the eastern half of Trás-os-Montes) only about three persons in a hundred *can* read and write, and hardly three in a thousand *do* read such things as newspapers and secular books. A newspaper or book denounced by the clergy would not find one reader among half a million of natives. The belief in witchcraft, amulets, miraculous shrines, and health-restoring relics, is still all but universal. At a word from the leader of a gang of stall-fed monks, a spectator who should refuse to kneel at the approach of their procession would probably be mobbed on the spot. Ecclesiastic drones treat a working man with an insolence equalled only by their crawling submission to the tyranny of their clerical superiors. "Noblemen," too, still abuse their privileges for every sort of ignoble chicanery. The reckless destruction of forests has resulted in droughts and other consequences which the starving rustics seek to avert by prayer-meetings. Epidemics are made a pretext for clerical extortions that often reduce whole families to the alternative of mendicancy or starvation. Disrespect to the person of an ecclesiastic blood-sucker is punished with prompt and exemplary severity, but extreme cruelty to animals (especially beasts of burden) is condoned as a trifling secular indiscretion. Industry is crushingly taxed to support a horde of crapulent mythology-mongers; in short, the country groans under exactly the same subordination of human to clerical interests which blighted the prosperity of the West-German bishoprics about the end of the thirteenth century.

Climatic influences have only a subordinate share in the causation of such results. In a warmer climate than that of mountain-girt Braganza, the city of Barcelona abounds with free-thinkers, religious and political protestants, flourishing schools, flourishing markets and industries, and can boast not less than twenty-eight well-supported periodicals and numerous large private and public libraries. The climates of North-Scotland and South-England represent very nearly the thermal difference of northern France and southern Spain, yet the isolated kirk-slave of Perth and Aberdeen will meekly submit to the insolence of a clerical bully who in railway-blest Kent would be kennelled like a troublesome dog. International Buda-Pesth, with its belt of pleasure resorts and elegant country-seats, is an eastern Paris, while three hundred miles further north the Carpathian highlands shelter the superstitions of the darkest ages. International travel has carried rationalism to the poorest villages of the Swiss highlands, while under exactly the same latitude and with the same conditions of soil and climate the solitude of Austrian Alpenland has made its hamlets as many strongholds of bigotry.

The highways of commerce have always favored

the progress of culture, and the omission of that factor of intellectual development has misled the historian of civilization into all sorts of singular sophisms. Fertility of soil and a genial climate, according to Henry Buckle's theory of social development, will insure an early advance from barbarism to industry and social order: hence the early civilization of Egypt and Asia Minor, and the tardiness of progress in arid Araby and frozen Scythia. In North America, argues the learned historian, there are large rivers on the east, but not a sufficiency of sun-heat, while on the west-coast, where warmth abounds, there is a deficiency of moisture. Hence the universal prevalence of barbarism, in the vast area north of Mexico. Previous to the arrival of Columbus and De Soto the territory now comprising the United States did not contain a single settlement deserving the name of a town. Heat without moisture on the west-coast and moisture without heat on the Atlantic Slope did not favor the development of civilization. But what about the well-watered coastlands of Oregon and northern California, with their more than Italian mildness of climate, we might ask, and what of Georgia, Alabama, Mississippi, West Tennessee and the Carolinas, where an abundance of warmth and moisture and an exuberant fertility of soil were for ages found compatible with a state of absolute barbarism?

The only logical explanation is the remoteness of those regions from the highways of international commerce. With an abundance of game and spontaneous food-crops (berries, wild chestnuts, wild grapes, etc.), and an almost perennial summer, the wild hunter of the southern Alleghenies could satisfy all his wants within a few dozen miles of his native wigwam, and felt neither the necessity nor the inclination to extend his rambles beyond the watershed of his native highlands. Strangers were dreaded as rival hunters. Dietetic fastidiousness and a desire for the products of foreign industry were discountenanced as effeminating vices.

In Mexico, on the other hand, perennial comfort could be secured only by an interchange of the commodities peculiar to the mild summers of the central plateau and the mild winters of the coast plain. After the middle of April the *tierra caliente*, or "hot-land," of the alluvial vega begins to develop a surplus of warmth and insect-life hardly compatible even with the most modest ideas of a paradise. Hundreds of Aztec patricians who had their winter-homes on the Gulf coast, spent their summers in the Sierra, and returned about the end of October when the *tierra fria*, the "frost-land," begins to illustrate the meaning of its name by frequent snow-storms. Fruit and fish were sent from the coast to the highlands; game and pressed snow from the highlands to the coast, which was also visited by Nicaragua slave-dealers and by refugees

from the arms of the warlike Caribs. The slavish character of the natives was incompatible with the development of true civilization: still, in arts, industry and knowledge the Aztecs stood above the Cherokees as the Cherokees ranked above a troop of Abyssinian mountain-baboons.

In South America, too, cities were found only in the neighborhood of the sea—the natural highway of primitive nations not hampered by the jungles of pestilential coast-swamps. Together with venomous serpents and blood-sucking insects, such swamps in the lowlands of the equatorial regions make Nature, in the exuberance of her untamed energy, a decided overmatch for the strength of man. In Brazil and Guiana, the rank luxuriance of vegetation more than defied the subjugating efforts of the primitive forest-nomads who may have roamed the valley of the Amazon for countless centuries; for in the Indian Ocean, too, and within range of a short voyage from the supposed birthland of the human race, two mighty islands, exceeding in their aggregate area all the territories of the Austrian Empire, have preserved the wild freedom of their primeval forests as successfully as the loneliest river-swamps of the Orinoco.

The caprice of despots has occasionally diverted the stream of traffic from its natural highways to arbitrary centres of civilization, as in Northern Russia and in the steppes of Central Asia. Soon after the downfall of the protecting dynasty, such regions of factitious culture are, however, apt to relapse into their primeval desolation, while natural centres of culture seem often almost destruction-proof and civilize successive hordes of barbarian invaders. Constantinople, for instance, has owned the rule of eastern and western savages, of ignorant and inhuman and even of insane tyrants, but thanks to its incomparable situation at the gate of two continents, has never ceased to be a city of cosmopolitan tendencies.

Dr. G. J. Zimmerman observes that "all great religions have originated in the solitude of the wilderness"; yet it is equally true that they found their readiest converts among the inhabitants of novelty-loving cities. Buddhism gained its first stronghold in the capital of King Suddhodana, Christianity in Jerusalem, Ephesus, and Rome; Mohammedanism in El Medina. Vanquished creeds, on the other hand, often linger for centuries among the very rustics who were the slowest in accepting their doctrines. In Italy, Catholicism has now its firmest holds among the natives of the isolated districts that originated the name of *Paganism* (from *pagus*, a rustic hamlet). The light of freethought has dawned in Barcelona and Madrid; but the midnight of orthodoxy still broods in the fastnesses of the Alpujares, where the followers of Islam resisted the inroads of the cross for nearly a century

after the fall of Granada. Traces of Paganism still linger in Sicily and the eastern Balkans, and according to Professor Vambery even in the Lepontine Alps, where the feast of the Baal-fire is still celebrated with rites strongly resembling the incantations of the Druids. In the Sierras of Jalisco the superstitions of the Mexican aborigines still count their votaries by thousands; and after the Nature-worship of Monism has become the religion of educated Americans the doctrine of renunciation will perhaps continue to rear its crosses in the highlands of western North Carolina.

(To be continued.)

## CORRESPONDENCE.

### IS THE SINGLE TAX THE SOLE CURE?

REPLY TO MR. SOL LEVY.

To the Editor of THE OPEN COURT:—

May I offer a few words in reply to Mr. Levy's latest criticism. He says that he can give "many instances where economy has had the effect of reducing wages," and he hopes that, "having demonstrated this," I will treat his doctrine courteously. He demonstrates nothing. He simply makes two assertions, without attempting to support them by any evidence whatever. The first is, that the wages of cigar-makers has been lowered by "economical Bohemian workmen"; and the second is, that the wages of Pennsylvania miners has been lowered by "frugal and economical men from Italy and Hungary." It is not necessary to dispute these assertions because the point in controversy here is not whether the wages of miners and cigar-makers has been reduced, nor whether it has been reduced by "frugal and economical" Bohemians, Italians, and Hungarians, but whether the reduction is caused by their economy and frugality. It is quite impossible that the frugality and economy of workmen can have the effect of lowering their wages. If such a result were possible, all the reasons that regulate wages would be reversed, and economic science would stand on an immoral foundation. For centuries, there have been "frugal and economical" men in every trade and calling. If their prudence lowered the wages of their brother craftsmen and themselves, wages would have fallen long ago to the minimum necessary for existence.

Mr. Levy repeats much of his former argument; and my answer to that will apply to the repetitions also. I will notice a few of his later statements. He admits that in his former article he misquoted Col. Ingersoll, but the reason was that he was a little careless, and "quoted from memory." He now gives us the quotation as amended, being careful at the same time to shelter himself behind the Colonel's back. He adopts the easy stratagem of weak disputants and overwhelms his adversary by taunting him with a sentiment from the writings of some great or famous man. A friend of mine, who worked with me on the same job, used to floor me in debate by the following formula: "Oh, you differ with Henry Clay, do you? Bad for Henry Clay." In like manner Mr. Levy tries to be sarcastic by showing "how a great lawyer, and a man of rare accomplishments is liable to lose his reputation as a scholar when confronted by 'Wheelbarrow's' school of political economy." In other words, "You differ with Ingersoll, do you? Bad for Ingersoll." The sneer is wasted upon me. I have no "school" of political economy.

I admit that Col. Ingersoll is a man of rare accomplishments, but nobody has ever accused him of being a great lawyer, although everybody confesses that he is a brilliant advocate. He is an ornamented soda-fountain, gushing, frothy, and sweet. His "reputation as a scholar" is not heavy enough to hurt him, while his political economy is narrow and illiberal. Last summer he pro-

claimed that the true policy of a nation is to find out what economic scheme will injure another nation, and then adopt it. His code of professional ethics as explained by himself shocks the moral sense. It is beautifully wicked. However, I have no controversy with Col. Ingersoll. I mentioned him incidentally because Mr. Levy quoted him as having said that "The bank book of a mechanic is a certificate that wages are too high." This appeared so extravagantly foolish that I thought there must have been a mistake made by Mr. Levy in the quotation. He now admits that there was a mistake, and that Col. Ingersoll did not say what Mr. Levy "quoting from memory" thought he said. Does Mr. Levy, having found out that Col. Ingersoll did not say it, still think it "an indisputable economic truth"?

Still sarcastic, Mr. Levy sneers at me for "throwing chunks of wisdom at the head of the laborer by preaching temperance, frugality, and self-denial, by telling him to be good, virtuous, and economical." I fear there is good reason in the sneer, and that there is much waste of work in throwing chunks of wisdom at the laborer; but after all, it is better than throwing chunks of unwisdom at him, by preaching that the virtues lower wages, and that all the ills, that he is heir to, can be cured by the magic of a single tax on land.

Mr. Levy quotes from Henry George's *Standard*, a catalogue of impossible blessings that will come to society by taxing land-values "to their full amount," and then reproaches me as follows: "This simple, just, but radical reform, Wheelbarrow terms 'the most tremendous feat of engineering ever done by mortal.'" I fear Mr. Levy is again "quoting from memory," because my remark was directed not at any plans proposed by Mr. George, but at the alarming decision of Mr. Levy, who, for the moment had let the land-tax go, and said that "nothing short of rebuilding our whole social structure will be of any real or lasting benefit to the masses." Considering the many thousands of years it has taken to build our social structure up to its present greatness, I thought that the taking of it all apart again and "rebuilding" it, would be a most tremendous feat of engineering. I think so still, although, no doubt, there are men in New York ready to "put in a bid" for the job.

The quotation from Henry George about "taxing land-values to their full amount," is followed by another, from Herbert Spencer, beginning "Such a doctrine is consistent, etc.," insinuating, of course, the doctrine just previously quoted from Henry George. I think the quotation from Herbert Spencer is worthless in this debate, because Mr. Levy wrenched its head off before he brought it in. The doctrine that Spencer was referring to, was not given. Separated from the context, which would have explained it, the beheaded quotation is tacked on the doctrine of Henry George, concerning the taxation of land-values to their full amount. This is hardly fair to me. In the language of honest Iago, "I like not that." I think the "doctrine" that Herbert Spencer was talking about should not have been suppressed and another one substituted for it, as little Buttercup mixed up those children in the play.

Mr. Levy kindly tries to explain to me the difference between taxing land, and taxing land-values. He clears up the matter in this way. "Land-values are not the product of human exertions; they are not a product at all, but simply a value that attaches to land by the growth of a community. The taxing of this fund made by all for the use of all would not be a tax at all, but in the correct sense of the term would simply be rent." This is like unravelling a tangle by tying a few more double knots in it. The explanations are contradictory. According to Mr. Levy, land-values are produced by the "growth of a community," and yet, he says, "they are not a product at all." A community is merely a collection of human beings, and all values made by the growth of a community are due to human exertions, yet, he says, "land values are not the product of human exertions." If land-values are not a product at all, they are nothing at all, and in taxing them nothing is taxed.

Land-values are incorporeal. They are mere qualities, as intangible as black, yellow, wet, or dry. Human laws have no jurisdiction over land-values separate from the land, because human laws cannot bring land-values under forcible subjection. If the taxes on land-values are not paid, the land itself is arrested and sold in satisfaction of the debt.

Mr. Levy is himself drawn into the whirlpool of his own logic. He spins round and round until different objects appear, all alike to him. Land-values, which are "not a product at all," become a "fund made by all for the use of all," and at last the tax upon this "fund" merges into "rent." In saying this, I do not intend the slightest reflection upon Mr. Levy's logical ability. I think the result was inevitable. The very moment we subject incorporeal "values" to the process of taxation, or to the burdens known as rent, we are compelled to attach them to some substantial reality upon which the penalties of the law may operate. All taxes are nominally upon values, but in reality they are upon things. When the assessor came round last spring, he asked me this question, "Have you a watch?" "Yes!" "What's the value of it?" "Twenty dollars?" And he made the proper entry in his book. It looks like a distinction without a difference, when I am told that the "value" of the watch was taxed, and not the watch itself.

Mr. Levy brings his argument to a provoking anti-climax in the last sentence of his article, where he affirms that "It is as true to-day as it was a hundred years ago when the French assembly declared that 'ignorance, contempt, and neglect of human rights is the sole cause of public misfortune.'" I suspect that this quotation is also made "from memory," although the French National Assembly said many things even more absurd than that, though not quite so ungrammatical. "Ignorance," "Contempt," and "Neglect," are three causes, and as neither of them can therefore be the sole cause, there may be a mistake in the quotation, especially as none of those three causes is the sole cause, according to Mr. Levy. He said in his former article that land-monopoly is the sole cause, and taxing land-values to the last penny the "only remedy." After putting me to the trouble of showing that there is no sole cause for public misfortune, but that there are many causes for it; and after disputing with me down to the very last sentence in his second article, he there abandons his own sole cause and adopts the three different sole causes which he says were declared by the French National Assembly a hundred years ago.

Mr. Levy says that he has no "personal controversy" with me. I have none with him; but as I believe him to be a man who sincerely desires the reformation of our social system, I have a personal appeal to make to him. I implore him to abandon the "sole cause" theory, and the "only remedy" prescription. A man of influence and ability may do great injury to the working-men by telling them that any specific plan of reform must "prejudice" all others. In the great scheme of human progress all the moral forces work in harmony together. Not any one of them has precedence over another! There is no jealousy amongst them, no pushing of each other out of the way. A single wrong fears nothing from a thousand rights disputing among themselves over questions of precedence.

WHEELBARROW.

#### MR. GRIFFEN AGAIN ON CAUSATION.

To the Editor of THE OPEN COURT:—

Objects and events of the phenomenal world, whether they be cause or effect, affect us merely by sensuous excitation and we get from them no direct idea or concept of causation. It is by reflection upon the contents of experience that we notice the chain of sequences in phenomena, and thus form the conception of causation. It is true that we cannot think of particular objects or things as existent solely in and of themselves, but we may and do think particulars without including in our thought any idea of the relation of causation. As, for instance, we may think of snow as

white, or as falling, without having the slightest notion or suggestion of [1] the cause of [1] the snow being white, or of its falling, or of its existence; but we cannot think of snow simply and stop right there in thought without taking into view any of the qualities or relations of snow. Having thought of snow as white or as falling we have not by virtue of the same mental act therefore conceived of snow in and of itself as something white or as something falling, minus all relation real or ideal;—we have, in the first instance, instituted a comparison between snow and other objects of our experience as to the distinguishing quality of color, or, in other words, we have classified it with other objects of like characteristic; while in the latter case (that of falling), we have placed it in relation with time and space along with other objects of experience.

Furthermore, as a matter of fact, but perhaps unconsciously and not in present thought, we have also joined, in the relation of subject and object, the rational self, or the thinking being, and snow as white or as falling. But all these and many other mental acts or states of consciousness may and do rationally take place without any thought or suggestion of causation entering into them. When we ask the question 'why,' we then start a process of reasoning which is very different from the simple perception or conception of phenomena or of phenomenal relations as existent in the physical universe or in ideas. The investigation into the 'why' of any and all facts, things and occurrences, is a mental process [1] which must be conducted under the principle of causation and according to its laws or rules of procedure. [2] Whether this principle of causation has any existence external to the thinking being, there is no direct means by which the thinking being can determine. [3] We simply cognize it as operating within and among our mental processes and conceive it as a necessary part of our mental nature. The inquiry into the 'why' is set in motion not solely, nor primarily, by observation of external phenomena as related to us. The brute may and often does look with keener eyes and hear with sharper ears than man, and in a sense observes or senses natural phenomena, but he does not rise into the domain of reason and seek [1] the cause of things. [4] Man is prompted and impelled to reason as to the cause and nature [5] of the objects and things which he observes about him by the *vis* of his own mind rather than by the external stimulus afforded by natural phenomena. Were he as stolid as the brute, nature's phenomena would appeal in vain to him for a solution of their being, and the principle of causation would be without a subject.

Hence we conclude that the principle of causation arises as a conception in consciousness from the natural constitution of the mind itself, and is simply a category, or pre-established rule, with certain limitations, within which we mentally place certain juxtaposed phenomena.

But the principle of causation, erected by the mind as a necessary condition to reasoning, is something different from an active, producing, or creative energy [6], the cause of all phenomenal being, if, in reality, there be such a cause.

A cause *simply*, real or ideal, is to be distinguished as a factor or an element in nature or metaphysics, amenable to the principle of causation, and may be in and of itself of any conceivable nature or constitution whatsoever. It cannot, however, be a cause, except if be susceptible of motion, since it must move upon the existing state or condition of things, in order to produce any change or effect in or upon that state or condition. [7]

Motion, however real or potent, as an ideal entity, has no existence in the phenomenal world, except as descriptive of phenomena in relation to space and time. It is not a substance and, in the sense of substantial entity, it is nothing; but the term connotes an important relation of matter to space and time. If matter possessed but one relation to space and time, viz., that of fixedness, or "at rest," we should have no conception of motion based upon anything real in the phenomenal world. The mechanical,

chemical, and biological changes which take place in the arrangement and associations of material atoms and bodies in space are effected through motion. In order to produce any change in the relation of matter to space, two things at least are necessary: first, a subject of motion (or of activity), and second, motion (or activity) itself. These two elements, combined and interacting with other subjects of activity, whether in action or at rest, constitute cause in the practical sense. A cause minus the subject of activity would be no cause, and hence a misnomer; [8] it would likewise be a misnomer minus the activity.

If there is no such thing in the universe as creation in an absolute sense, excepting only as to the forms of things, there must still be a point from which a new form begins to be; and, in the domain of thought, the mind itself, creating its own forms of procedure, yet not the subjects-matter or contents of those forms, becomes a true productive cause. [9] We may hence safely infer that the forms of thought, being the creations of intelligence and will, the forms of matter, and of all real being likewise, proceed from some analogous but supreme source of intelligence and will. [10] Man creates a world of thought for himself, in which order, in more or less degree, is immanent. He also observes order, in more or less degree, immanent in the phenomenal world about him. Shall he then say that in the one case he, a thing of will and intelligence, is the author of the order he observes, and that in the other case the order immanent in nature has no intelligent and willing author? [11] Because order is immanent in nature, we are not therefore relieved of the intellectual duty of assigning sufficient cause, [12] or proper origin, or reason, for that order. Order immanent is but order inherent, and I am utterly unable to conceive of order existent anywhere in any form or manner, other than as a product of intelligence and will.

A. M. GRIFFIN.

CHICAGO, Oct. 25, 1888.

#### EDITORIAL NOTES.

[1] We should here substitute, [1] the reason for. [1]

[2] We should substitute in place of this passage the following: [1] which, in every single case, after a statement of the process of causation, must be conducted according to the rules of scientific inquiry. [2] These rules consist in classification chiefly by means of generalization and discrimination.

[3] Causation exists independent of the thinking being, but the process of reasoning does not. The meaning of the expression "principle of causation" is ambiguous.

[4] We should again substitute: [1] the reason or *raison d'être* for phenomena. [2] Animals can observe, and really do observe, the causes of phenomena; but they do not seek for the reasons of phenomena. Schopenhauer relates, that when he pulled back the window-curtains, his poodle searched for and detected the cause in the motion of the string. The experiment as to whether animals search for causes, is easily made. Tie a silk-thread to a bone and throw the bone to a dog. Be careful that he cannot discover the thread. If he commences to gnaw, suddenly withdraw the bone, at a favorable moment, in such a way that he does not notice the motion of your hand which withdraws the bone. It is difficult to deceive the dog; but if the experiment is a success, it will have an effect similar to that of ghost-fright. In one case, I am told, the dog at first jumped after the fugitive bone, but when it escaped again from under his paws without any visible cause, he withdrew howling, and could not be induced to touch it again.

[5] 'Cause' and 'nature' are not identical. Reason (the mental faculty of reasoning) enables man to search for reasons or *raisons d'être*, which explain the nature or qualities of things.

[6] "Energy" is a property of nature, from which, as a reason, we explain why things move. It is no cause; special movements, however, due to energy of some kind, are causes.

[7] The whole paragraph is unintelligible to me, and mere sub-

stitutions, as in the cases above, would not suffice to come to an agreement.

(8) Motion considered by itself is abstract motion, causation considered by itself is abstract causation. But for that reason neither motion nor cause is a "misnomer." Compare, on page 1242 of *THE OPEN COURT*, the editorial remark No. 4.

(9) Mind can be called a cause only when defined as a special kind or form of brain-activity.

(10) If forms of matter proceed from, or are caused by, some activity, this activity need be neither will nor intelligence; nor is there any reason to call it "a supreme source." If they originated from some activity superior to themselves, they would represent a degeneration. Evolution teaches the contrary. Higher organized forms develop from lower ones. Supernaturalism has been used as an explanation of this fact; but in vain. Progress, the miracle of evolution, can only be explained from the changeableness of form.

(11) If some order is produced or caused by an intelligent will, there is no reason for assuming that another kind of order, or even that all order, must have been caused by an intelligent will. On the contrary, we know cases in which the order mechanically results of necessity. And such order mechanically produced is always more accurate than that consciously produced by the effort of an intelligent will. Letters printed from types by a press are sure to be more regular and more accurate in their orderly arrangement than such as are painted or written.

(12) 'Cause' and 'reason' are, according to our view, radically different. So long as their difference is not recognized, the problem of causation will remain unsolved. It is by no means strange that a person who does not adopt this distinction should ultimately have to resort to the explanation of a supernatural author of causation; or, what amounts to the same, he will become agnostic and declare causality to be an unsolvable mystery. Both supernaturalists and agnostics despair of solving the problem; their method of solution is a surrender rather than a real solution and will be discarded as soon as the mere possibility of a monistic solution is conceived.—Ed.

#### CAUSE AND OCCASION.

To the Editor of *THE OPEN COURT*:—

May I speak one word in appreciation of your article, entitled "Is Nature Alive?" That gravitation or attraction, and chemical affinity are akin to what in the organic world is called life, seems to me highly probable, and the best answer to the inquiry after life that I have ever seen. In the article on Causality, page 1267, I think I see an error which, corrected, would strengthen your position as taken in the article on "Is Nature Alive?" You write: "The cause of volition of the mind is not the mind itself; but, as a rule, a desire." Again: "The person committing a crime is not a cause. The cause of a criminal's act is his motive." The "desire" and the "motive," I should say, are the *occasion* but not the cause of "volition" or "crime." The cause is the molecular brain-motion or the person. This would better accord with the "opinion" you express near the close of page 1265, "that the atoms, as well as the masses of matter, possess spontaneity or the property of self-motion, which is akin to what in the higher forms of natural phenomena in the organic kingdom is called life. Self-motion is, therefore, life in a broader sense, and the phenomena which are exhibited in protoplasm must ultimately find their explanation from its form as a special and complicated instance of the simpler self-motions of inorganic substances." There can be no occasion then for "desire" or "motive" to cause volition. Desire and motive are themselves caused by atomic or molecular motions of the brain. Desire and motive are the occasion, but cannot be the cause of volition. This would relieve you from the awkwardness of saying: "The person committing a crime is not a cause. But, of course, the criminal is answerable for his deed." His deed, and yet he

not its cause! A dead motive may be an occasion, but it cannot be the cause of anything. The molecular brain-motions which are the life, as you well say, or the person,—these are the cause of the volition. The "criminal," then, who "is answerable for his deed," is the cause of the deed.

FERRY MARSHALL.

Stowe, Vt., Oct. 21.

[Every occasion is a cause. Occasions are such causes as happen incidentally. 'The arrival of a friend will cause us to remain at a place; but an unexpected occurrence will occasion a delay of business with which we happen to be concerned at the moment.' Accordingly we can use the more general term cause for occasion, but not *vice versa*. 'An accident causes or occasions loss.' But we cannot say 'misfortunes occasion affliction.' Affliction is no incidental but the natural and inevitable consequence of misfortune; and in such a case we can only say 'misfortunes cause affliction.'

It is a matter of course that we have no objection to a loose usage of the word 'cause' in popular speech. In conversational style we may speak of a man as being the cause of his actions. 'Cause' is also used in the sense of 'party principle.' We say, e. g., 'the cause of patriotism is embraced by all good citizens.' A cause may be a lawsuit which we endeavor to win. It is obvious that all these uses of the word are fully justified. But if the word is employed as a philosophical term, we have to define it in such a way as to exclude all ambiguity. If our definition of cause is accepted, then the cause of a man's deed is his motive, which, physically considered, is of course "molecular brain-motion." His character (which is a property of the man) is the *raison d'être*, the ground why he allows himself to be guided by such a motive; and, having a character of that kind, the man is responsible for his actions.—Ed.]

#### BOOK REVIEWS.

L'IDÉALISME EN ANGLETERRE AU XVIII<sup>È</sup> SIÈCLE. By Georges Lyon. Paris: 1888. Félix Alcan. 1 Vol. 7 fr., 50 c.

In the presentation of the work now before us, M. Georges Lyon has done an undoubted service to the history of English philosophy. His design has been, to study in its sources, and to follow in its successive modifications the great philosophical principle that the metaphysicians of ancient Greece had anticipated, and that Berkeley carried to its perfection.

The speculations of Descartes and Malebranche have exercised an exceptionally potent influence upon English thought, and M. Lyon has endeavored to present to the public the prominent features of the various philosophical writings that owe their origin to the inspiration of the authors cited. Though written for the philosophy-reading public of France, its discussions and estimates will be of equal value to the readers of England and America; inasmuch as it treats of authors and works almost as imperfectly understood in the places of their nativity, as in France, where a critical acquaintance with the lesser productions of American and English schools could hardly be expected: we refer to the writings of John Norris, Arthur Collier, etc. American readers will take especial interest in the chapters upon Samuel Johnson and Jonathan Edwards, the illustrious metaphysicians of our colonial period, and will find in this work a just estimate of their importance in the history of philosophy.

MRK.

MEXICO: PICTURESQUE, POLITICAL, PROGRESSIVE. By Mary Elizabeth Blake and Margaret F. Sullivan. Boston: 1888. Lee & Shepard.

We know of no book that gives within so narrow a compass so great an abundance of material for reflection upon the picturesque and political features of our sister republic, as the work before us from the pens of Mrs. Sullivan and Mrs. Blake. Mexico has had

many historians of the romantic epoch of the Conquest, from the quaint old Diaz to the stately and graceful Prescott, but this land of immobility has been singularly unfortunate in its historiographers and chroniclers of subsequent periods. "Although," says Mrs. Sullivan, "hundreds of authors have travelled the country and left their impressions on record, out of the mass of their labor little that is of absolute value can be extracted. . . . Writers in the present century only repeat the narrations of those of the preceding ones." Continuing, the authoress says: "Partly from observation and partly out of authorities selected from various groups,—in an effort to keep clear of partisans against Mexico,—and with the understanding that in statistics estimates must be employed in lieu of ascertained facts, I venture to offer some brief considerations." Then follow remarks upon the constitution and government, religion and education, the economical policy, the manufactures, etc.—all unknown subjects to us, and treated by a writer who has given the public abundant evidence of an authoritative acquaintance with political and economical problems.

The bulk of the book has been taken up by Mrs. Blake in Part I, entitled "Picturesque Mexico." An enumeration of the chapter-titles alone would testify to its attractiveness: "Into the Sun Land"; "Glimpses of a New World"; "Through Lanes and Highways"; "Shrines and Pilgrimages"; "Literary Mexico"; "Blossoms of Verse," etc. We mark it as an interesting book.

THE FAITH THAT MAKES FAITHFUL. By William C. Gannett and Jenkin Lloyd Jones.—SHOW US THE FATHER. By Messrs. Savage, Culthorp, Simmons, Chadwick, Gannett, and Jones.

A collection of sermons which breathe the fresh spirit of Unitarian Christianity. It cannot be expected that they should be entirely free from dogmatic embraces, but their ethical spirit (especially of the first little volume) is refreshing.

THE PHILOSOPHY OF KANT, AS CONTAINED IN EXTRACTS FROM HIS OWN WRITINGS. Selected and translated by John Watson, LL. D., Professor of Moral Philosophy in the University of Queen's College, Kingston, Canada, author of "Kant and his English Critics."

Professor Watson says in a Prefatory Note: "The study of philosophy is of little value if it does not teach a man to think for himself. The process of self-education is necessarily a severe one, and, therefore, distasteful to the natural man. Yet any attempt to evade it by some 'short and easy method' defeats the end. What is required is a process by which the student who is really in earnest may pass, gradually and surely, from a lower to a higher plane of thought. The philosophical writings of Kant, which exhibit in brief the transition from the old to the new, I believe to be a potent instrument for this end. But the struggle upwards must be made by the student himself." Therefore the Professor's plan was, "to set a class of more advanced pupils at work upon extracts from the philosophy of Kant, to watch them as they forced their way through its perplexities, and to put forth a helping hand only when it seemed to be needful." A limited edition of Extracts which had originally been printed for the use of his own students, but were also used in other American Universities, are now out of print, and Prof. Watson has gone carefully over the writings of Kant again, and he adds: "Selecting and re-translating all the passages essential to the understanding of his philosophy. The Extracts have been taken from four treatises—the *Critique of Pure Reason*, the *Metaphysics of Morality*, the *Critique of Practical Reason*, and the *Critique of Judgment*."

"In the translations," the Professor says, "I have sought to express Kant's meaning as clearly and simply as I could, and in no case, so far as I am aware, have I been misled by a pre-conceived theory of what he ought to say."

And he adds: "I believe that what is here given contains all the main ideas of Kant in their systematic connection."

As the writings of Kant, it must be confessed, are "full of confusing repetitions," such a selection as offered in this book is quite commendable for any one who wishes to become acquainted with Kant not through the medium of interpreters but directly with himself.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXV—Continued.

An expression of irony overspread the broad features of Mr. Hummel.

"So that fellow over there is your equal?" he began; "that is exactly what I wished to disabuse your mind of. I should not approve of your regulating your feelings according to that weather-cock over the way. I do not choose that the idea should ever come into the head of Hahn Junior to build an arch across the street, and to wander about in slippers from one house to the other. The thought does not please me. I will bring forward only one reason, which has nothing to do with the old grudge. He is his father's son, and he has no real energy of character. One who can endure to sit year after year in that straw-nest, turning over the pages of books, would not, if I were a girl, be the man for me. It is possible that he may be very learned, and may know much about things that other men care little for; but I have not yet heard that he has accomplished anything by it. Therefore, if that should happen, which will not happen so long as the property over there is a poultry-yard,—if I, Henry Hummel, should consent that my only child should sit knitting stockings in front of the white Muse, it would be a misfortune for my child herself. For you are my daughter. You are just as self-willed as I am; and if you should get among those white-livered people, you would disturb them lamentably, and be very unhappy yourself. Therefore, I am of opinion that your headache was silliness, and I wish never to hear again of like ailments. Good day, Miss Hummel."

He strode out of the door, and as he heavily descended the stairs, he hummed the tune:

"Bloom, sweet violet, that I myself have reared."

Laura sat at her writing-table supporting her heavy head with both her hands. This had been a trying scene. The speech of her stern father had wounded her deeply. But in his depreciating observations on their neighbor's son there was a certain truth, which had already crept like a hateful spider over the bright leaves of her sympathy. He must go out into the world. Her friends below were thinking of going into foreign parts. Ah! she herself, a poor bird, fluttered her wings in vain, for the fetters on her feet held her back. But he could free himself. She would lose him from her neighborhood, perhaps lose him for ever; but this ought not to hinder her from telling him the

\* Translation copyrighted.

truth. She hastily searched among the old sheets; she could find but one ballad, which undoubtedly did not fit the Doctor, inasmuch as it expressed the feelings of a dissolute wanderer. The song was inappropriate, but there was none better. Our ancestors, when not occupied in highway exploits, took little pleasure in travelling. The letter must do the work. She wrote as follows:—

"The summer birds are flying, and man also years after the distant lands of his dreams. Do not be angry with the sender of this, for begging you to imbibe something of the spirit of this song. Your home is too narrow for you. Your merits are not appreciated here as they deserve. You are deprived in the quiet house of your parents of those experiences which a man gains when he forms his life by his own qualifications. I well know that your highest task will always be to promote learning by your writings. That you may do everywhere. But do not think it beneath you to influence younger minds by personal intercourse with them, and to participate in the struggles of their generation. Away, Doctor! the unknown bird sings to you the song of the wanderer. With sorrow will your loss be felt by those you leave behind."

About the same hour, Gabriel was sitting in his room brushing the last specks of dust from his best livery which he had spread over a chair. At his feet lay the red dog, licking his paws and giving utterance to an occasional growl. Gabriel looked contemptuously at the dog.

"You are not handsomer, nor better than last winter. Your knavish nature delights in nothing but eating, and flying at the legs of the passers-by. I have never known a dog so much hated, or who deserved it so well; for your only pleasure is to despise all that is respectable. What is your favorite amusement? When it has rained and a ray of sun attracts people to walk in the wood, you lurk on the steps; and when a young girl appears clad in her light summer dress, then you leap like a frog into the puddle that lies before her, and spatter her dress all over, and I have to fetch a cab to take her home. What did the strolling cigar-dealer do yesterday to provoke you. His chest was standing on the bench in Mr. Hummel's garden, and the prospect of a bargain was certain. The cigar-man went a few steps from his chest to speak to an acquaintance, and you, miscreant, made a spring at the bread and butter lying on the chest, and came with all fours on the glass. It broke, and the splinters mixed with the cigars; you trampled them altogether into a powder, and then returned to the house. You, monster, caused your master to deal roughly with the trader when he complained of you, and the man packed up his wares and went away from our house

with a curse on his lips. On what nocturnal excursion have you been since then? No human eye has seen you."

He bent down towards the dog.

"So this time it has gone into your flesh. I am glad to see you can injure yourself as well as others."

Gabriel examined the dog's paw and extracted a glass splinter. The dog looked at him and whined.

"If I only knew," continued Gabriel, shaking his head, "what pleases the dog in me. Is it the bones, or perhaps some roguish trait of mine that amuses him? He hates the whole world, and even snarls at his master; but he comes to visit me and behaves himself like a worthy companion. And he is still more crazy about my master. I do not believe that the Rector knows much of Spitehahn. But whenever this fiend sees my Professor, he peeps at him slyly from under his shaggy eyebrows, and does his best to wag his tuft of a tail. And when my master goes to the University, he runs after him like a lamb behind its mother. How comes it that this black soul attaches itself to the Professor? What does he want with our learning? They do not believe in you anyhow, Spitehahn."

He looked round suspiciously and hastily donned his coat. Arrayed in his Sunday attire he left the house. The Hahn family were not at home, for Dorchchen was looking out of the dressing-room window. She laughed and nodded. Gabriel took courage, and stepped into the enemies' hall. The door of the room opened. Dorchchen stood on the threshold curtsying, and Gabriel, holding the handle of the door, began, solemnly:

"It would be much more pleasant for me if I could have the pleasure of accompanying you in your walk to-day."

Dorchchen replied, twitching at her apron:

"I have got to stay here to mind the house, but that need not prevent you from going."

"I should then take no pleasure in it," replied Gabriel, bowing, "for I should be always thinking of you, and I had much rather be with you here than only think of you in the open air. If, therefore, you would allow me to stay here a little while—?"

"Why, come in, of course, Gabriel."

"Only to the threshold," said Gabriel, advancing, still holding the open door. "I only wanted to say that the number of which you lately dreamt is not to be found at any of the offices. I have, therefore, taken another, and have had it drawn by a little beggar lad, as that brings good luck. I shall be so pleased if you will play this number with me. It is quite a sum, for it is a whole eighth of a ticket."

"But that will be no good sign," said Dorchchen, with pretty embarrassment.

"Why not, Fräulein? It was a real beggar-boy."

"No, I mean when two play together who love one another."

"Dear Dorchen!" cried Gabriel, approaching nearer and seizing her hand.

A hollow gurgle interrupted the conversation. Dorchen drew back from him terrified.

"It was a ghost," she cried.

"That is impossible," said Gabriel, consolingly: "for, first, it is day-time; secondly, it is in a new house; and, thirdly, spirits generally do not make such a noise. It was something in the street."

"Your being here is a real comfort to me," exclaimed the timid Dorchen. "It is fearful to be alone in a large house."

"To be together in a small house is particularly jolly," cried Gabriel, boldly. "Ah, Dorchen! if we could venture to think of it."

Again a slight rumble was heard.

"There must be something here," cried Dorchen. "I am so alarmed!"

She sprang away from him to the middle of the room. Gabriel took a yard measure, and looked under the furniture.

"So you are there, are you?" he cried, angrily, poking with the yard measure under the sofa.

Spitehahn leaped forth with a bark on to the nearest chair, from the chair on to the console, on which the clock stood; he knocked down the clock, and dashed through the half-opened door.

It was the parlor clock and a wedding present. Mr. Hahn wound it up every evening before he went to bed; it had two alabaster pillars with gilded capitals; the rest was of American wood, and represented a triumphal arch. Now the treasure lay in ruins, the pillars shattered, the woad broken, and the dial split. In the opened works a single wheel whirled with fearful rapidity, all the rest was motionless. Dorchen stood dismayed before the fragments, and wrung her hands.

"The monster," groaned Gabriel, occupying himself in vain with the shattered work of art, and endeavoring with no better result to comfort the poor maiden, who trembled before the terrors of the ensuing hour.

"I had a foreboding," cried Mr. Hahn, on his return home, "that something would happen to-day. I forgot yesterday, for the first time, to wind up the clock. But now my patience is at an end; there will be war to the knife between him over the way and me." He approached the sobbing maid threateningly. "Bear witness to the truth," he cried out; "the court will demand your testimony. Do not seek safety in hypocrisy and lies. Was it the dog, or was it you?"

Dorchen dramatically related the whole transgression of Spitehahn; she poked under the sofa, as if she could draw the dog out bodily; she confessed,

weepingly, to the open door, and explained Gabriel's presence as owing to an inquiry he had made of her."

Mr. Hahn hastened to his writing-table, and wrote a strong letter to Mr. Hummel, in which he related the misdeed, and threateningly demanded compensation. This letter Mr. Ruddy carried off to Mr. Hummel, with a board on which were laid the ruins of the clock.

Hummel read the letter carefully, and threw it on the table.

"I congratulate your master upon his new undertaking for the summer," he said, coldly. "Carry the débris back again; I have no answer for such nonsense. Some people *will* make fools of themselves."

The following day a judicial complaint again raised its Medusa's head between the two houses. This time even Mrs. Hahn was deeply incensed; and when she, shortly after, met Laura on the street, she turned her good-humored face to the other side, to avoid greeting the daughter of the enemy.

Laura received the Doctor's answer to her letter. In a pretty poem the happiness of the parental house was extolled, and he spoke of his great delight in his neighbor's charming daughter, whom the poet saw in the garden among her flowers, whenever he looked over the high hedge. He further added: "The advice which you express so sincerely in your lines has found an echo in me. I know what is lacking in my life. My learning makes it impossible for me to find recognition in wider circles, an honor, which the friends of a learned man desire for him more eagerly than he himself does; it also makes it difficult for me to adopt the academical course to which I have now a call in foreign parts. But the nature of my studies takes from me all hope that any outward results can ever overcome the hindrances which oppose themselves to the secret wishes of my soul."

"Poor Fritz!" said Laura; "and yet poorer me! Why must he give up all hope because he studies Sanscrit? It is not courage that is wanting to these learned men, as father says, but passion. Like the old gods about whom you write, you have no human substance, and no blood in your veins. A few sparks are occasionally kindled up in your life and one hopes they may light up into a mighty flame; but immediately it is all smothered and extinguished by prudent consideration." She rose suddenly. "Ah! if one could but lay hold of Fritz by the hair and cast him into the wildest tumult, through which he would have to fight his way bloodily, defy my father, and hazard a great deal, in order to win what he in his gentle way says he desires for himself! Away with this quiet, learned atmosphere: it makes those who breathe it contemptible! Their strongest excitement is a sorrowful shrug of the shoulders over other mortals or themselves."

(To be continued.)

GEORGE M. GOULD.

In Nos. 24, 25 and 26 Mr. George M. Gould treats of "The Ethics of Economics" rather as a quality absent from our economic system than as a living principle belonging to it. His doctrine is that all things produced by human labor represent the expenditure of human life, and that dollars and dimes, being representatives of wealth or earnings, are as drops of precious human blood. Therefore, in order to a rightful ownership of dollars, we must earn them; we must return to society a share of our own lives equal to the quantity we have received from our fellow men. According to Mr. Gould, whenever we eat or drink we partake of a solemn eucharist, where "the shadowy ghost of humanity calls out to us: 'Take, eat; this is my body. Drink ye all of this, my blood which is shed for many.'" This is not to be understood metaphorically, he says, but as "an exact statement of the fact."

While perhaps the theory of economics presented by Mr. Gould may not be scientifically true in all its parts, the moral he draws from the actual facts of our industrial system is true enough for warning and for guidance. The partnership of capital and labor is the panacea of Mr. Gould, the solution of the labor question. But from his ideal plans of industrial emancipation he excludes unpleasant facts. He allows only profit-sharing to come in, and loss-sharing is never taken into calculation. Yet it is the possibility of loss that has thus far defeated the "co-operation" experiment. It is doubtful if the operatives in any great factory would accept the whole plant as a gift, if compelled to take it on the terms by which its owners run it, the chances of profit and loss.

There is some extravagance in his language, but that is only a measure of his benevolent impatience at the inequalities and wrongs which refuse to be cured by his remedies. That the "ethics of economics" lies in the doctrine of "equivalence for service" is very likely true, but there is a difference of opinion as to the correct measure of that "equivalence," and a still greater dispute as to the means by which that measure shall be legalized and enforced.

EDWARD C. HEGELER.

In No. 15, Mr. E. C. Hegeler explains his view of the soul. The soul, he says, is the form of a very complicated, self-acting mechanism of living substance; a part of its activity is accompanied with feeling; the feelings correspond in form to the most essential parts of the mechanism. The soul, as expressed by Bock, enters into our brain through the gateway of the senses. Reason is formed through the instrumentality of language. Noiré says: "Man thinks because he speaks." Immortality does not only mean the indestructibility of matter and energy but *soul preservation*. It implies not only continuance of life, but life in a special form. We can to a great extent renew ourselves by forming our soul in the growing generations through education and by example. To preserve and to elevate the *quality* of the human soul, that is the basis of ethics.

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. Katzenjammer is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to Katzenjammer. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer's hand was that of Cataline! What Katzenjammer was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost his eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igdrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.  
Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.  
Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.  
A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

An Agnostic View of the Doctrine of Vicarious Atonement. By W. H. Spencer. Price, 5 cents.

Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. James. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts: 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Mico J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 104 pages. Price, 10 cents.

Social Ideals. By David A. Wasson. Price, 10 cents.

The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Grubbine. Price, 15 cents.

Natural Religion. By James Vila Blake. Price, 5 cents.  
The Family Purse. By James Vila Blake. Price, 4 cents.

The Philosophy of a Strike. By N. A. Dunnig. Price, 5 cents.  
Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to *THE OPEN COURT*; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,

Box F., Chicago, Illinois.

Henry J. Ennis,

Attorney and Counsellor in Patent Cases.

Rejected and Complicated Cases a Specialty.

Office: *Lenox Building,*

WASHINGTON, D. C.

(Opposite the U. S. Patent Office.) P. O. Box 112. Patent Business Exclusively.

Mr. GEO. WILLIS COOKE will lecture during the season of 1888-89, as usual. He is prepared to give four lectures on *The Intellectual Development of Women*, and three on *The Poetry of Robert Browning*. He also has lectures on George Eliot, Charles Darwin, Robert Browning, and Emerson. During the past summer he has prepared a new course of four lectures on *The Social History of New England*, in which he will describe the town meeting, the meeting-house, the Puritan minister, and the home life of our forefathers, with the aim of showing how the people actually lived and how American ideas were gradually developed. Mr. COOKE's address is DEDHAM, MASS.

Three Introductory Lectures

—on—

## The Science of Thought.

(First published in *THE OPEN COURT* of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-173 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

- "Full of novel thought."—*Chicago Herald*.  
 "The subject is discussed with great clearness and simplicity."—*Book Chat*.  
 "The absurdity of the theory is manifest."—*New York Science*.  
 "The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.  
 "Max Müller's supremely simple theory is hotly disputed,—but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.  
 "The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.  
 "The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

## "THE WEEK,"

A Canadian Journal of Politics, Society, and Literature.

Published every Thursday. \$3.00 per annum.

"THE WEEK," Canada's Literary Journal, which has entered its fifth year, appeals by its comprehensive table of contents to the different tastes which exist within the circle of a cultured home, and will endeavor faithfully to reflect and summarize the intellectual, social, and political movements of the day.

In politics "THE WEEK" is thoroughly independent. It is untrammelled by party connections, free from party leanings, unbiased by party considerations, its desire being to further, to the utmost of its power, the free and healthy development of the Nation.

C. BLACKETT ROBINSON, Publisher,  
5 Jordan Street,  
Toronto, Canada.

Sample Copies Sent Free on Application.

TO ADVERTISERS.—"THE WEEK" affords an excellent medium for advertisements intended to reach the professional and cultured classes of Canada. It is read by people who can purchase what they want and pay for what they purchase. None but the choicest business announcements will be taken. All advertisements will be set up in such style as to insure "THE WEEK'S" high typographical appearance, and enhance the value of the advertising in its column. For rates, etc., apply to

## THE SPIRITUALISTS' CONFESSION.

BY MONCURE D. CONWAY.

To those who remember the first Rochester rap, the scene at the Academy of Music, on Sunday evening, Oct. 21, was more replete with dramatic effects than any play ever witnessed there. Some were comic; as when five physicians were holding the shoeless foot of a somewhat hysterical woman to find if the hammerings heard through the theatre proceeded from it. Other features of the scene, though they excited the laughter of the young, were not without a certain tragical import for maturer minds; such as the occasional cries from spiritualists in various parts of the house, to whom the whole thing was a ghastly attempt to bury alive their loved ones who had been dead, but who had been restored to them by the faith now pronounced by its founders an imposture and delusion.

The elder of the impostors,—to whose confession assent was given by the younger from the private box where she sat in full view,—solemnly asked the pardon of Almighty God for her career of deception. She also invoked pardon "for those who have opened their hearts to the silly imposture." She did not ask pardon of those she had deluded. There is something so ghoul-like in fattening on graves, so vampyre-like in living on the life-blood of hearts yearning for their departed friends, that pardon could hardly be asked for—unless of so lenient a confessor as her Catholic Father, who told her that "as she was in this business, and did not believe in it, and had to support herself, to charge very high prices, so that it would at least limit the number of [her] patrons."

The confession is brief. The whole spiritualist movement proceed from a cultivated abnormality in the big toe.

The elder woman's big toe sounded like a muffled hammer, but I heard every stroke from the farthest part of the balcony.

That, then, was the Rochester rap, whose effect may be compared to first gun of the revolution—"heard round the world." Who cannot remember the thrill of the tidings that invisible intelligences were signalling their presence through the mediumship of two humble and innocent children at Rochester? The unbelieving made fun of the little Foxes exhibited by their sister Fish as agents of the spiritual world, on

strictly business principles; the critical suggested explanations, among them that now confessed; but thousands eagerly welcomed the theory that out of the mouth of babes infidelity was to be confounded.

From Rochester the spiritualistic sower went forth to sow everywhere the seed which sprang up in ghosts. There was not a house in which people did not try to get raps on their tables. But toes able to hammer were not numerous. Muscles that could tip or turn tables, purposely or unconsciously, were universal; so table-turning was spiritualized. Under the Rochester raps all manner of defunct conjurations revived. Mesmer came from his grave, and began to make his passes in the land of Franklin, despite the quietus given his pretensions by Franklin in Paris. Along with holy hopes and visions, and the mysteries of the unfathomed inner life, hypnotism and hypocrisy, magnetism and imagination, tricks, legerdemain, were thrown into the cauldron which the Foxes set bubbling, and out of it was evolved Spiritualism.

In the forty years since that November when the Fox children were first tested in public,—by committee after committee, with stethoscopes, and even without clothing,—Spiritualism has gained more converts than Christianity gained in three centuries. There must have been a combination of favorable conditions. In the last century similar noises occurred in the Wesley family at Epworth. The Cock Lane ghost in London rapped replies for John Wesley and others, similar to those at Rochester. But those incidents occasioned no religious revolution. Forty years ago the effect can only be compared to the conflagration which the same children, with one spark, might have spread over a prairie. The religious growths must have been dry and combustible.

The age is far past since the toiling and suffering millions of Protestant lands have enjoyed realistic visions of the spiritual world. When the Anglo-Saxon man ceased to kiss the papal toe he became politically erect; he became scientific and progressive; but his rosy heaven has been getting more dim ever since. Spiritualism uplifted once more over our cold and cruel world the heaven of guardian spirits. To my vision there was a phantasmal procession passing across the stage where the medium made confession; of those whose humble lot had been illumined, whose

griefs were rendered endurable by what Emerson called "the rat-hole revelation." Behind these came shining foreheads—William and Mary Howitt, Edmonds, Hare, De Morgan, Varley, Wallace, Oliphant, Crookes; and also poor Zöllner came from his Asylum, leading many whom the raps had deprived of sanity. They all advanced, as if in a Sistine chapel, and solemnly pressed their lips to the Toe of the Fox woman!

According to this confession Cleopatra's nose never made more history in the Old World than the Fox girls' toes in the New. But a suspicion occurred to me that we have as yet only a small part of the confession which these mediums owe to the world they have been humbugging. They were introduced by Dr. Richmond, who is lively and ingenious. He imitated the slate-trick, the name-reading and the bank-note tricks, and showed how easily he could cheat us. But it is doubtful whether Dr. Richmond has been careful not to be deceived himself while undeceiving others.

It was gentlemanly to mitigate a woman's humiliation, but the doctor went too far in saying that Margaret Fox had never claimed that her manifestations were the work of spirits. On November 6, 1884, she was tested by the Seybert Committee in Philadelphia; and although at one point of the *séance* she did say "I do not say the sounds are from spirits," she also said that she had no control over them, and pretended that the spirit of Mr. Seybert used those raps to communicate with the committee. "Every rap," she said, "has a different sound. For instance, when the spirit of Mr. Seybert rapped, if the sound was a good one, you would have noticed that his rap was different from that of another." At another time Dr. Pepper, Provost of the University of Pennsylvania, addressed the spirit of Mr. Seybert: "Harry, will you communicate with me as you promised to do?" The promise had been through the same medium, who now gave responsive raps; then she called for paper and wrote, from right to left, a communication signed Harry Seybert.

It may be mentioned here that the Seybert Committee discovered that the raps came entirely from this medium's person. Dr. Furness, the Shakespearean scholar, with the medium's consent held her foot during the raps, and said: "I distinctly feel them in your foot. There is not a particle of motion in your foot, but there is an unusual pulsation." After this she declined another *séance*.

But although this toe power seems abnormal, and worthy the attention of scientists, it is insufficient as an explanation of the spiritualistic career of these sisters. Dr. Richmond announced that the younger sister assented to whatever the elder said, and Mrs. Catharine Fox Jencken gave visible sign of such as-

sent from her stage box. But Mrs. Jencken must have known, albeit Dr. Richmond did not, that her career is not explicable by toe raps. To her, perhaps more than to any other, is due the deception of the English scientific men by whose credit spiritualism has been able to survive in that country exposures which would otherwise have crushed it. The first scientific convert there was Varley, the electrician.

Nineteen years ago the London Dialectical Society, of which I was a member, appointed a committee to investigate spiritualism; and on May 25, 1869, Mr. Varley gave evidence before it. He gave a memorable account of *séances* with Catharine Fox. "The spirit who was to coöperate with me was stated to be Dr. Franklin. When I appeared the first time with the apparatus at the minute appointed, I was received with a chorus of raps such as fifty hammers, all striking rapidly, could hardly produce.... Miss Fox, you are doubtless aware, is the medium through whom the modern spiritual manifestations were first produced in the United States, and through her mediumship the most striking physical phenomena I have ever heard of were witnessed by my friends Dr. Gray, a leading physician in New York, and by Mr. C. F. Livermore, the banker, both of them shrewd, clear-headed men. During my investigations, Mr. Livermore and Mr. and Mrs. Townsend sat with us. Mr. Townsend is a New York solicitor, at whose house the meetings of the circle were held. Mr. Livermore went and stood by her and distinctly saw a hand, and we all saw a blue light come from under her dress. I have often seen these lights in her presence."

It was, also, at Mrs. Jenckens house, near the Crystal Palace, that some of the wonderful things occurred which Lord Lindsay related to the Dialectical Committee. The celebrated Mr. Home was staying there, but some of the marvels appear to have involved coöperation. Thus, Lord Lindsay, having missed his last train, slept in Home's room, and, just as he was going to sleep, saw a female figure at the foot of his sofa. "She seemed to be dressed in a long wrap going down from the shoulders, and not gathered in at the waist. Home then said, 'it is my wife; she often comes to me.' And then she seemed to fade away."

As no other lady appears to have been in the house than Mrs. Jencken, who now assures us that spiritualism is an imposture, it would be interesting to learn her explanation of this apparition. Obviously, it could not have proceeded from anybody's toe. Nor can it be supposed that the Fox toe is capable of multiplying itself into the fifty simultaneous hammers which Cromwell Varley heard in the presence of Catharine Fox, or of emitting the blue lights seen by him and others coming from under her dress, or of shaping itself to the aerial hand seen by Mr. Livermore.

It is plain, therefore, that the confession of these sisters is incomplete. It is to be hoped that having dismissed lying spirits they will be possessed by the spirit of truth alone. The only compensation they can now give to the world they have so long conspired to delude, avowedly for gain, and for the money they now make by their confession, is that this should be the truth, the whole truth, and nothing but the truth. These "reformed mediums" have been in the confidence of the spiritualist world; they have been intimate with the mediums of Europe and America. If now, as they declare, they have entered on a "holy war" against the movement they inaugurated, let them give the whole thing away. That cannot be done by the physiological curiosity displayed at the Academy of Music. Nor do Dr. Richmond's ingenuities explain the manifestations wrought by Mr. Home and herself in Mrs. Jencken's house. How did Home levitate and elongate? How did burning crystals appear on his head? How was managed that vision which Mr. Jencken attested—"a figure, draped in what appeared like a transparent loose gauze or veil, passed to and fro, imaged on the wall, which had become luminous"?

The solving of some of these mysteries does not concern the mere curiosity of mankind, but their most vital and practical interests. Dr. Richmond exclaimed from the stage: "There has not been a miracle performed for 1800 years. Anybody who pretends to work miracles ought to be in the penitentiary." "How about Miss Fox?" cried a voice. "How do we treat State's evidence?" was the clever retort. But I remarked that the allusion to miracles 1800 years ago was followed by a burst of general and derisive laughter. And what wonder? What are the people to think of miracles of a pre-scientific age, reported only in the century following their occurrence, by tradition from unlearned witnesses who could not be cross-examined, when here, in our time, the very experts of testimony,—lawyers like Judge Edmonds, Mr. Jencken, and others; scientists trained in experimental investigation, like Varley, Hare, Crookes, Wallace,—are found at the feet of vulgar tricksters, where the fraud is veiled with unctious sentimentalism?

What is the value of testimony warped by religious and human emotions? To these lawyers, judges, scientists, the community entrusts issues of life and death. The opinion of Mr. Crookes whether a red spot on a garment be logwood or blood might determine a prisoner's life or death. The late Andrew Leighton, an English poet, eleven years ago demanded through the press: "What is there in Mr. Crookes's expositions of these phenomena which renders his evidence inadmissible or incredible, while his paper on his discovery of the metal *Thallium* and his latest discovery of

the dynamical force of light are accepted by the scientific world with universal acclaim? If he be a competent witness in the one case, is he not equally so in the other?" The only possible reply to this position was that in the case of *Thallium* his discovery was verifiable by any and every man, but the "materializations" reported in his book (*The Phenomena Called Spiritual*) are not verifiable. But it was easy to answer that the unbelievers had not, for verification, gone through the exact and patient experiments which led Mr. Crookes to his discovery. This position, logically weak, was practically impregnable. But where logic and criticism failed the clumsiness of mediums succeeded.

The mediums with whom both Crookes and Wallace conducted their experiments were subsequently detected in frauds, so completely that English spiritualists disowned them. And now the medium whom Varley, an electrician of the Atlantic cable, declared most wonderful of all, avows herself an impostor. Think of a scientist successfully testing the Atlantic cable, but victimized by a girl's toe-joints!

I once asked Professor Tyndall how he accounted for the spiritualistic belief of a certain eminent man of science. He replied: "That man's intellect is a loom. Give him his facts, he will vigorously weave them; but his discrimination as to what are facts is faulty, and he will sometimes weave rotten along with sound threads into his web."

Not long after, a female medium—a favorite with these spirit-scientists—was detected by two gentlemen of the British Museum. While the spirit was walking about the room under a dim light she was clutched by one, and the other, striking a powerful light, revealed the form of the medium,—supposed to be securely bound with sealed knots in a cabinet. The facts were certified in the *Times*. They were admitted. But the scientific man whose judgment Dr. Tyndall questioned wrote a letter to the *Times*, maintaining that the spirit, not being able to materialize that evening, had that evening utilized the medium's body, without that medium's consciousness or knowledge.

What wise spirits! To select for this exceptional performance the particular evening when two scientists were present with apparatus for bringing their medium into disgrace! Yet such was the degree to which emotional enthusiasm could smother the brain which, simultaneously with Darwin, discovered the law of Evolution!

#### THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

BY S. ARTHUR STRONG.

The institution of the Hibbert Lectures may be regarded as supplying a want which would otherwise be

keenly felt in England as compared with France, Holland, and Germany—the want, namely, of some organized and permanent encouragement for the study of religion from the comparative and scientific as opposed to the sectarian or missionary standpoint.

The foundation of the rational criticism of the Bible—the throwing open, that is, to the free application of methods tested and found fruitful in secular inquiries of a field long marked out by a thick wall of traditional prejudice as holy ground—will always rank among the most precious of the many contributions made by Germany to that common fund of deeper culture, maintained, as it were, by international effort, and upon which the liberal education of our own country is becoming more and more dependent, as the insufficiency of our academical machinery to provide for its growing needs is becoming more and more apparent. France and Holland have not been slow to tread the path traced and to a large extent cleared by Germany. Though the glory of the Tübingen school—once so notorious in England—may have departed, its traditions of labor and freedom have found worthy representatives in Leiden: the Collège de France, whose very foundation was at once a promise and a protest, includes in the number of its endowed professors one whose duty it is by widening our knowledge of religions to purify and deepen our conception of religion; but in England—in spite of endowments the magnificence of which the foreigner envies—in spite of the fact that our older academies, unlike their continental sisters, are still mainly true to the religious character impressed upon them at their foundation—it has been left to the generous enterprise of a single person to supply the only permanent means whereby the educated classes of this country can make acquaintance with the results of historical criticism, as applied without prejudice to that subject which to the mass of thinking men is still the most absorbing and important. We are far from defending or even excusing the attitude of the English universities. They have held aloof from a movement which they should have inaugurated: instead of welcoming and supporting a new science, they have regarded its introduction from abroad and rapid growth in a freer air than their own with at best a sulkily acquiescence; but on the other hand, it must not be forgotten that the *libertas philosophandi*, without which in its most absolute form our study is but a mockery and a sham, can hardly be secured and enjoyed by those who through membership of a corporation centuries old are confronted at every turn by prejudices and beliefs which are never slow to assert themselves, but which in the interest of social harmony must be recognized and, if possible, conciliated. From this it would seem to follow that what the young foundation loses in artificial prestige,

it may gain in scope and variety. The occupants of the Hibbert chair enjoy absolute freedom of choice in the matter both of subject and of method. The tone which they adopt is not necessarily one of apology, but, as in the case of the exponents of all other branches of science, is determined by conviction and predilection. They are free from the obligation of serving a particular class-interest by exalting one department of their subject at the expense of all the rest; and the lectures being delivered by a series of scholars, of whom each speaks of that which he has specially studied, represent, as it were in outline, the whole area covered by the science in question.

The volume before us differs in one important respect from all its predecessors—not only in bulk, though it is the largest yet published by the Hibbert trustees—but in its relation to its author. It is the outcome of a labor of love devoted to a task, for which the author's qualifications are superior in kind to those possessed by any former occupant of the same chair. We have watched great scholars as they tried so to piece together the scanty remaining fragments of shattered mosaics as to restore, if nothing else, the outline of the principal forms. In such cases the antiquary has only a partial survival to deal with; and the tradition of the extent and significance of the whole may have been interrupted centuries ago. Habits of thought alien from those of his own land and time, he must present and expound as best he may; putting his ear to the ground, as it were, he has to catch the faint echoes of a buried life.

In the case of Professor Rhys, however, there is one feature which distinguishes him at the outset from scholars confined in their observations to the remote standpoint of an alien. He is bound by the strong tie of blood to the race whose early religious monuments he restores and interprets. Of the languages with which he has to deal, several are still spoken; and though the mythology of the early Celts has been largely obliterated by a Christian overgrowth of almost equal extent and complexity, it has nevertheless left traces in abundance, which are still easily recognizable, in the thought and customs of the Celts of the present day. Hence it follows that, though the worker in the field of Celtic literature who is himself a Celt is not exempt from the difficulties and uncertainties which flow from the very nature of his subject, he can yet claim the balancing advantage that he has access to and can employ a continuous tradition. The bridge spanning the gulf between the present and the past may be narrow; it may not be equally strong at all points; but with care and caution it can be safely crossed.

When it is remembered that the present volume of seven hundred pages is but a tithe of what the author might have given us, had he been free to follow

his own plan as to amount and arrangement, the statement made in the preface that certain of his English friends wondered where he could possibly find material enough to fill six lectures will be fully appreciated. It would in fact be almost impossible to confine within the limits of a precise statement the loosely floating, vaguely held ideas of the ancient Celts and their literature which, in default of exact information, are still current in the minds of educated Englishmen. Some fail to distinguish between Celtic and Norse; others—and these are of the subtler kind—have their suspicions of the political tendency of the study of Irish origins, in much the same way as many 'serious churchmen' are alarmed at the intrusion of unsanctified criticism into regions long comfortably wrapped in the mists of tradition. But even those, *qui severiores Musas colunt*, whose wanderings in search—it may be—of the picturesque have led them to the essays of M. Renan and the late lamented Matthew Arnold, will find an abundance of what is indeed rich and strange in the monumental work of Professor Rhys. Britain for the Britons: and, if the attention of the younger generation of students be only aroused in time, we may yet succeed in keeping the first place in the band of schools who are exploring the antiquities of our own islands. For there seems to be no clear reason either of patriotism or of sentiment why we should continue to allow the negligence with which we are too often reproached, to feed, as it were, the already swollen stream of German chauvinism.

The earliest form of Celtic belief, of which any account has reached us, is the religion of the inhabitants of ancient Gaul. In our survey of this region we have two kinds of information to guide us—the statements of ancient authors, and the testimony, in many cases still obscure and partial, of inscriptions. In the former class the account left us by Julius Cæsar of the Gaulish pantheon is the most important piece of evidence which we possess. The situation of the observer was uniquely favorable. With the practiced eye of a supreme pontiff he surveyed the forms of the Gaulish religion under the direction of one of its own ministers, at a time when, the adoption of the Roman fashion having scarcely begun, it could still be studied in its native dress.

Mercury figures in Cæsar's account as the great god of the Gauls. After him come Apollo, Mars, Jupiter, and Minerva; and the only difference between the Gaulish conception of these divinities and that with which we are familiar in Roman mythology seems to lie in the central and commanding position assigned to Mercury; for, as described by Cæsar, the Gaulish gods possess the same attributes and discharge the same functions as their namesakes of the Roman pan-

theon. But at this point the question arises to what extent does the evidence of existing inscriptions confirm or correct the account of Cæsar. Upon this question Professor Rhys has brought to bear inexhaustible ingenuity and comprehensive learning, and the result of his investigation forms the subject of the first lecture.

In estimating the value of the monuments, two circumstances must not be overlooked. Of those which remain few are in the native language; while all belong to the period of the Roman supremacy in Gaul, when the Celtic deities, if they retained the national style in the matter of outward appearance, had in all cases assumed Roman names, as a sign of their adoption into the central pantheon.

In the case of Mercury the evidence furnished us by inscriptions, scanty though it be, is yet such as to confirm in its main features the account of Cæsar. The epithet *Artaios*, which is read on a stone found near Beaucaumont in the department of the Isère, is connected by Professor Rhys with such words as the Welsh *ar*, 'plough-land,' and interpreted in the sense of the Latin *cultor*. *Mercurius Artaios* would thus be the same as the *Mercurius Cultor* of an extant inscription from Württemberg, from which identity we can gather that the ancient Celts regarded Mercury as the patron of agriculture. In another inscription he appears without a name simply as the inventor of roads and paths; but by far the fullest and most picturesque account of the Gaulish Mercury which has come down to us is from the pen of Lucian, who identifies a god called by the Celts Ogmios with Heracles. Now it is plain from his description of a picture of this Ogmios that no Heracles in the Greek sense was intended; for, though equipped like Heracles with bow and club, the Gaulish god was in other respects so strangely represented as to suggest the idea that the artist had intended by this means to insult the gods of the Greeks and Heracles in particular. A very old man, bald and with the brown, weather-beaten complexion of an ancient mariner,—such was the form given to Heracles by the irreverence and audacity of the Celts. But even this was not the strangest part of the picture; for there was drawn a crowd of men bound by their ears with slender cords, of which the other ends were attached to the tongue of Heracles. In this way he was drawing the crowd after him, which followed eagerly like men unwilling to be set free. Such a picture as this would naturally shock Lucian with his Greek notions of propriety in the matter of artistic presentation; but a knowing Gaul who stood by, observing his astonishment and disgust, volunteered an explanation:

"We Celts," he said, "do not consider the power of speech to be Hermes, as you Greeks do, but we represent it by means of Heracles, because he is much stronger than Hermes. Nor should

you wonder at his being represented as an old man, for the power of words is wont to show its perfection in the aged. So if this old man Heracles, the power of speech, draws men after him, tied to his tongue by their ears, you have no reason to wonder, as you must be aware of the close connection between the ears and the tongue. In a word, we Celts are of opinion that Heracles himself performed everything by the power of words, as he was a wise fellow, and that most of his compulsion was effected by persuasion."

The value for our present purpose of this lively anecdote lies in the word Ogmios and the association of the god thus named with speech and the power of it. For if we seek the equivalents of Ogmios in the language of the Celts of the British Islands, we are led along the lines of phonetic corruption and decay to the Irish *Ogma* and the modern Welsh *oyyd*. The meaning of the latter "in the earliest passages where it occurs, is not easy to fix; but that of 'one skilled or versed in anything, a teacher or leader,' would suit them all. Later, the duties of an 'oyyd' were said to be 'to improve and multiply knowledge'; and it is now the name of one of the three kinds of graduates or professors recognized by the Eistedvod, the other two being bards and druids." In Irish, however, Ogma is the name of an important personage, champion of the Tuatha Dé Danann, and the legendary inventor of the Ogam alphabet. Popular etymology derives Ogam from Ogma, which is impossible; so we must conclude that the contrary relation connects the two forms, and that Ogma took his name from an important attribute or function expressed by the word *Ogam*. Now, as it is improbable that the Celts were acquainted with writing at the time when Ogmios was first so called, it follows that spoken rather than written words will yield the clue to the original meaning of the connection. And, if we assume that *Ogam* denoted fluent speech, a stream of words, we have an explanation of the character and title of the god in complete harmony with the picture described by Lucian as that of an old man eloquent.

Apollo figures in Caesar's list not as the sun-god, but simply as the healer,—a description which is too narrow, as it excludes several divinities who may justly be regarded as sun-gods, and who appear in the monuments in the likeness of Apollo. Of the native names or epithets borne by this divinity the most important were Maponos, Grannos, and Toutiorix. The explanation of Maponos can easily be found. "It is the same word as the old Welsh *mapon*, now *mabon*, 'boy or male child,' which occurs, for example, in a Welsh poem in the book of Taliessin, a manuscript of the thirteenth century." Hence it seems to follow that the deity worshipped by the Celts under this title was regarded as a child—a conclusion which is curiously confirmed by the evidence of inscriptions from the remote province of Dacia. For instance, in *Deus Bonus Puer Posphorus Apollo Pythius*, the epithet *bonus*

*puer* is regarded by Professor Rhys as standing for the Maponos in question. On the meaning of the second epithet, Grannos, we can throw some light by comparing it with the cognate forms, in Sanskrit *ghr̥na* and *ghr̥ni*, in English, *gleam*. As applied to the Gaulish Apollo, it must have had the force of an adjective conveying much the same meaning as the *posphorus* of the Dacian inscription, between the terms of which and the native names of the god another point of contact is exhibited in Mogounus, a title found ascribed to Apollo Grannus in an inscription from the neighborhood of Horburg in the Haut-Rhin. Professor Rhys's philological examination of the word Mogounus is too long to be reproduced here. The conclusion, however, to which we are led through a long series of comparisons is, that underlying Mogounus we have the same idea as that which was established for Maponos, namely boy or youth; so that *Apollo Grannus Mogounus* would be exactly equivalent to *Puer Posphorus Apollo*.

The third epithet, Toutiorix, is found—in the dative case—in a single inscription, *Apollini Toutiorigi*, at Wiesbaden. But the interest attaching to the word is largely due to the fact, that, in its Latinized German form Theodoricus, we are familiar with it as the name of the great king of the Ostrogoths, who, in the fifth century, A. D., conquered Italy, and established the Gothic Kingdom of Ravenna. Now, the High German form corresponding to Toutiorix is Dietrich; and Dietrich von Bern is no other than Toutiorix or Theodoricus of Verona, a point where, as we shall see, the streams of mythology and history meet and blend. For with regard to the conqueror himself:

"It is found that with his history so much unhistorical matter has been incorporated, that modern authors usually distinguish between the historical man as Theodoric the Great, and a mythical personage to whom the name Dietrich von Bern is left. Many attempts have been made to disentangle the legends from the historical portions of the story of the Teutonic conqueror; but it has never been satisfactorily shown why such and such mythic stories should have attached themselves to this particular man. The inscription alluded to yields the key: the historical Teuton bore one of the names of the Gaulish Apollo, and the eventual confusion of myth and history was thereby made easy. This is borne out by the general similarity between the mythic statements made about Dietrich and what is known in Celtic literature about Celtic sun-gods. Among other things may be mentioned his riding into the sea after an enemy, who was only enabled to escape by the intervention of a mermaid, who was his ancestress. As one of Dietrich's solar peculiarities may probably be mentioned his breathing fire whenever he was made angry, and like more than one of the Celtic sun-heroes, he is made to fight with giants and all manner of wild beasts. It has puzzled historians that Theodoric, the grandest figure in the history of the migration of the Teutonic peoples, should appear in the *Nibelungen Lied*, not as a great king and conqueror on his own account, but merely as a faithful squire of the terrible Attila, whose empire had in fact crumbled into dust before the birth of Theodoric. But from the mythological point of view, the subordinate position ascribed to Theodoric is quite correct, and

it serves to show how profoundly the man's history has been influenced by the legend of the Celtic god."

The Celtic Mars is presented to us by inscriptions under many names, of which, perhaps, the most important in its bearing upon Comparative Mythology is *Camulos*. It occurs in the name *Camulodunon* (stronghold of *Camulos*), and is doubtless to be referred to the same root as the Old Saxon *himil*, German *himmel*. This association with, or derivation from, the sky reminds us at once not only of the Indian *Varuna*, but of the Greek *Zeus* and the Italian *Jove*; though the fact that the Romans recognized in *Camulos* not their own sky-god, but their god of war, reveals what at first sight seems to be a marked difference, whether original or developed, between the two pantheons; while the Teutonic *Tiu*—the same etymologically as *Zeus* and *Jove*, and like *Camulos*, god of war—marks, as it were, a point in which the Gaulish and the Roman conceptions meet. In *Camulos*, therefore, "we have discovered the Jupiter of the Celts, and found that Gaulish theology ascribed to him the discharge of functions which the Romans would have regarded as more properly belonging to Mars."

With regard to the god, whom *Cæsar*, on the strength of resemblances which it is now difficult to trace or to restore, identified with Jupiter, Professor Rhys remarks: "I cannot help regarding the Gaulish god whom he equated with Jupiter as far from possessing the importance or rank which that equation would suggest; nor is it improbable that the phenomenon of thunder was treated as one of the forms of his activity." This suggestion in the hands of Professor Rhys forms the starting-point of an investigation which we have not space to follow in detail: we can only call attention to its most important result, the discovery of a Gaulish thunderer, whose name—if the reading *Tanaro* of the Ashmolean inscription can be trusted—shows the same root, and bears the same meaning as the English word *thunder*, German *donner*, Norse *thórr*. No less important and instructive are the steps by which our author—whose mastery is nowhere more conspicuous than in the handling of phonological details—gradually ascends to the form *Eus* (Lucan's *Hesus*) as the name or title of this divinity, Thor's counterpart among the Gaulish thunderers; but, before leaving the Gaulish pantheon, we must pass on to consider briefly the gods of that other or under-world, with which the ancient Celts seemed to their neighbors to be strangely familiar.

Though we find no mention of *Dis* in *Cæsar*'s list, yet we learn from the same authority in another place that the Gauls claimed to be descended from *Dis Pater*, and that to this fact of relationship was due their strange custom of measuring time by nights rather than by days, and, in other respects, of giving

darkness the precedence over light. Ancient testimony being thus vague and incomplete, it is to the labors of modern—chiefly French—archæologists that we owe the discovery not only of the name of this dark divinity, but also of the outward form under which his votaries conceived him. On a Gallo-Roman altar dug up at Paris, and explained, as to the device and inscription it bears, by M. Mowat, we read the name *Cernunnos*, underneath which "is to be seen, bearded and clothed, a central figure whose forehead is adorned with the two horns of a stag, from each of which hangs a torque. The monument is unfortunately in a bad state of preservation; but the head and shoulders are on such a large scale as compared with the other figures on the same block, that the god cannot have been represented as standing or even as sitting on a raised seat: in fact there is no alternative but to suppose, with M. Mowat, that the god was seated cross-legged on the ground, like Buddha."

Two features of this quaint description stand out as being probably of mythological significance, the horns of the god and his sitting, or rather squatting, posture. To the horns we can at once detect an allusion in the etymology of his name; for, in the words of Professor Rhys, "the form *Cernunnos* and the Latinized one *Cernenus* contain the common stem *cern*, which may be assumed to be of the same origin as the native words for the Gaulish horn or trumpet, variously given by Greek writers as *κίρνον* and *κίρνος*; the Welsh and Irish form is *corn*, of the same etymology and meaning as the Latin *cornu*, English *horn*." In the second place, if we admit, with M. Mowat, the squatting posture, we can connect the figure on the Paris altar with certain well known representations of a horned squatting divinity such as those found at Rheims, Saintes, and Vendœuvres-en-Brenne. Applying the data furnished by these monuments to the question of *Cernunnos*, Professor Rhys concludes that the latter was god of the dead or of the under world, and that he was also held to be lord of riches, especially the metallic wealth hidden in the bowels of the earth. At this point the etymology of the words *Pluto* and *Dis* is not without significance, the former being derived from *πλοῦτος*, 'wealth,' the latter being, as it is supposed, a contraction of *divēs*, 'wealthy.' The question, however, what was the exact mythological significance of the undignified attitude and grotesque appendage of *Cernunnos* still presses for an answer.

M. Mowat, relying on the testimony of ancient authors, would explain the attitude as one characteristic of the Gauls themselves, and assigned to *Cernunnos* as the god from whom they claimed descent, the Gaulish deity *par excellence*; while the horns appear to the same authority to be simply a form of the cornucopia or emblem of plenty. M. Mowat seems therefore to assign

the figure in question to the period when Roman forms and symbols had been almost universally adopted by Gaulish artists; while, on the other hand, Professor Rhys in his search for a solution transports us backward through the neighboring region of Teutonic mythology to the far away time before the "Aryan separation."

At the very threshold, then, of the Teutonic pantheon, we come upon an ancient god, whom we find in a subordinate, not to say menial, position, but who before the rise of new divinities had probably seen better days. He was called Heimdal, and out of the scattered and fragmentary allusions to him in Norse literature it is difficult to restore a complete and intelligible picture. Two of his attributes, however, are of importance in our present investigation. He is described as having golden teeth, and as the porter or watchman of the gods. Besides, it is not irrelevant to note that all men without distinction of rank—kings, earls, and thralls—are descended from him.

Now, as the notion of the gods dwelling together in one house with a porter at the gate is a comparatively recent one, we may assume that Heimdal's original occupation was to sit at the entrance of the nether world—a theory with which his golden teeth symbolizing the lordship of wealth or riches would be in perfect harmony. We have, therefore, over against Cernunnos a squatting divinity, lord of wealth, father of all men, and god of the dead; so, if we can trace an allusion to horns in the accounts which survive of him, we shall complete the parallel.

Now it is a curious fact that the two other names borne by Heimdal—Hallinskidi and Heimdali—are both said to mean a ram, from which we may perhaps infer that the god was originally represented under the form of a ram; but the fact that a man's head in Norse poetry is occasionally styled 'Heimdal's sword,' is more curious still, for it clearly points to some famous occasion on which Heimdal fought with a head either his own or another; "but as it is not called a club or hammer, but *hjör*, which meant a sword, also a missile weapon, and even a shield, it is highly probable that the original myth represented him as fighting with no head but his own, the horns on which served him for sword, spear, and shield all at once."

If, therefore, our comparisons be valid, we have established the important conclusion that Gauls and Teutons recognized the god of the dead under the same peculiar form; but the further question—out of what did this conception itself arise,—it is impossible to answer in the present state of our knowledge. Professor Rhys's suggestion, that in the horned divinity of the dead we may perhaps see a relic or descendant of a primeval elk, supporting the base and underlying the substance of the world, is ingenious, and may in

course of time prove fruitful; but the most that can now be said of it is that it is not impossible.

Nothing is more curious and remarkable in the strange jumble of reason and prejudice, fashion and sentiment, called modern thought, than the large and increasing proportion which the religious ingredients bear to the other elements of the mixture. There are persons, who, not content with conjuring from their graves in creed and system the ghosts of the past, must construct by anticipation the religion of the future. In fact, so absorbed are many of us in the contemplation either of what has not yet come or of what will never come again, that the right of what is actually with us—whatever it may be—to analysis and explanation is too readily forgotten. But in this sphere, too, we must protest against invidious distinctions. Of Buddhism, of late years, we have had abundance in all its varieties and from all quarters—so much so that the tide of fashion, turned by the force of an inevitable reaction, has begun to ebb away. With the Norse gods, moreover, we are tolerably familiar, for, in spite of their rough exterior and their savage ways, they have invaded the polite regions of contemporary verse; while their close relations and near neighbors the gods of the Celts, have hitherto suffered from a dishonoring neglect. It is therefore with all the more gratitude that we welcome the learned attempts of Professor Rhys to divest, as it were, of their "purple shrouds" these gods so long buried and forgotten.

#### INTRODUCTION TO A POEM.

LOUIS BELROSE, JR.

When the sad wind, from wandering round the sea  
Or through the regions of eternal snow,  
Tells to the harp its endless tale of woe,  
The chords are moved responsive and set free

A vague and shadowy sound of sympathy.  
Not in skilled measure does their grief o'erflow,  
But artless plaints that dreary-long and low  
Like waves of sorrow die upon the lea.—

Such my poor song; a wind of doleful sighs  
That came distinct above the murmuring  
Of nature's millions, born to agonize,

Swept o'er my heart. O ye, who've heard this thing  
And felt the tears of pity in your eyes,  
Attend my lay: in pity's name I sing.

#### BOOK REVIEWS.

DOCTOR BEN. *Orlando Witherspoon*. Boston: Ticknor & Co.

This is one of the late issues in Ticknor's paper series, a story dealing with Canadian life and character, and adding an unusual element of interest in the character of the unfortunate hero Ben Hallins, whom a severe accident, followed by a long period of illness, had temporarily deprived of the use of his mental faculties. In this study of abnormal mental traits and activities, and the equally faithful description of the character of the villainy-plotting Macral, the main interest of the story lies. C. P. W.

A SHORT HISTORY OF THE WAR OF SECESSION. *Russell Johnson*.  
Boston: Ticknor & Co.

The writer of this excellent and useful work explains in the preface that his first intention was to write a long and full history of the war of the rebellion; but having an opportunity to put his work into the form of thirty articles for the *Examiner* he changed his purpose, being convinced that there was greater need of the shorter history than of a more compendious work. Mr. Johnson's book is written in a style attractive both to young and old, philosophical in tone, by which is meant that the work deals not only with the events and outward cause of the war, but with its inward causes, of clear and concise narrative form, and an admirable general review of the subject.

C. F. W.

Mr. S. Burns Weston in *The Ethical Record* (Vol. I, No. 3) opposes the Utilitarian doctrine, according to which the morally good is explained to be the useful or that which produces happiness.

Mr. Weston says p. 82-83: "The late notorious Jacob Sharp had the boldness to say, that, because he was working for what would be a public good, therefore, the fact that he bribed the New York aldermen should be excused, and not be regarded as either a criminal or an immoral act. And one of the most influential of the New York journals stated that if he had boldly confessed what he had done, when brought before the courts, and declared that he found bribery to be necessary in order to secure a needed public benefit, the public would at least have shown him great indulgence. The idea that immoral means to secure great public benefits are allowable is far too prevalent. It is far better that we do without such benefits than that they be bought at that price."

Mr. Weston substitutes the idea of the perfect as the final aim of life, but every philosophical or religious substantiation of the ethical ideal is repudiated. The idea of perfection ranges morally higher than utilitarianism, but it is too general and too vague to have any definite meaning. Man's ethical ideal is entirely dependent upon his conception of himself, his purpose of life, and his relation to mankind as well as to the universe. Mr. Weston's proposition to study man without taking into consideration the world which has produced him and to constitute man's "final aim of life" by a positive exclusion of any theory of the universe in which man lives, appears to us an impossible task. "We may just as well square the circle or set out in search for the 'thing of itself.' All ethical systems, which lack the basis of a conception of the world (be it called religious or philosophic) are a delusion. It is true that the morals of men are sometimes better, sometimes worse, than the convictions they profess, but as a rule a world despising creed will produce asceticism while an ennobling faith will inspire us with an elevating morality. Ethical systems that are scientifically and philosophically well established will exercise a most beneficial and powerful influence. [For instance Kant's ethics are based on his Transcendental Philosophy and propounded with classical simplicity in his *Grundlegung zur Metaphysik der Sitten*.] But an ethical doctrine which professes to be ethics absolute will remain a shadowy air castle without substantial reality.

MY PREDECESSORS. *F. Max Müller*.

Prof. F. Max Müller found it necessary to write an answer to the numerous critics of his book, "The Science of Thought." "I was not prepared," he says in the *Contemporary Review*, p. 474, in an essay, entitled "My Predecessors," "to find nearly all my critics under the impression that this theory of the identity of thought and language was quite a novel theory, something quite unheard-of—in fact, a mere paradox. This showed the same want of historical knowledge and tact which surprised so many philosophers in Germany and France at the time of the first appearance of Darwin's book 'On the Origin of Species.' Most of the leading reviews in England seemed to consider the theory of evolution as something quite novel, as a kind of scientific heresy, and they held Darwin personally responsible for it, whether for good or for

evil. Darwin himself had at last to protest against this misapprehension, to point out the long succession of the advocates of evolution, from Lucretius to Lamarck and Oken, and to claim for himself what he really cared for, a legitimate place in the historical evolution of the theory of evolution. \* \* Of course, such an expression as identity of thought and language can be cavilled at. If Kant is right, no two things in space and time can ever be 'identical, and if people really take identical in that sense the sooner the word is altogether superseded the better. When we say that language and thought are identical, we mean that they are two names of the same thing under two aspects. There is a very useful term in Sanskrit philosophy, 'apṛithagbhāva' ('the not being able to exist apart'), and it is this, the impossibility of thought existing apart from language, or language from thought, which we mean when we call the two identical. We can distinguish for our own purposes, and these purposes are perfectly legitimate, between the sound and the meaning of a word, just as we can distinguish between the pitch and the timbre of our voice. But though we can distinguish, we cannot separate the two. \* \* We can certainly distinguish the sound of a word from its meaning, but we must not expect to meet with meanings walking about in broad daylight as disembodied ghosts, or with sounds floating through the air, like so many Undines in search of a soul. The two were not two, but were one from the beginning, and the *πρωτον ψευδος* lies in this attempted divorce between sound and meaning.

"All our words are conceptual, all our concepts are verbal."

\* \* The consequences which follow by necessity from this recognition of the identity of thought and language, and which I was anxious to put forward as strongly as possible in my "Science of Thought," may, no doubt, have startled some philosophers, whose chief strength lies in the undefined use of words. But that theory itself could never have startled a careful student of the history of philosophy. It is a very old friend with a new face, and had a right to expect a different reception. \* \* If we use *thought* promiscuously for every kind of mental process, it stands to reason that to say that thought is impossible without language would be absurd. To feel pain and pleasure is an inward mental process, to see and hear are inward mental processes; to stare at the images of present and past events, to build castles in the air, to feed on such stuff as dreams are made of—all this might certainly be brought under the general category of mental activity. For ordinary purposes we need not be too particular about language, and, if people like to call all this *thinking*, why should we object? I, myself, when there can be no misunderstanding, use *thought* in that general sense, and use the word *mind* for all that is going on within us, whether sensation, perception, conception, or naming. I did not, therefore, put on my title-page, "No thought without language," but "No reason without language; and I did so after having defined reason as the addition and subtraction \* of conceptual words.

"Much astronomical observation was required before people could persuade themselves that their evening star was the same as their morning-star, and much linguistic observation will have to be performed before anybody will see clearly that our language is really our thought and our thought our language."

#### NOTES.

The appearance in pamphlet form of M. Binet's articles upon the Psychic Life of Micro-Organisms, will be delayed in order to introduce into the work some additional observations, with a preface by M. Binet, and to procure additional cuts from Paris. We shall publish in the meantime an interesting chapter upon the "Physiological Function of the Nucleus" by the same author, translated from the *Revue Philosophique*.

\* We prefer the expressions "combination and separation" in place of "addition and subtraction."

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXV.—Continued.

Thus did the passionate Laura chafe in her attic-room, and again was her paper moistened by bitter tears, as she sought consolation in heroic verses, and called upon the foreign gods of the Doctor to take the field against the pranks of Spitehahn.

Glorious Indra and all ye divinities shining in heaven,  
That have so often conferred blessings on races of men,  
Haste in rescue to us, for great misfortune doth threaten.  
Ominous shadows of night darken our peaceable home,  
Banish the child from the father; while flat on the door-step outspawling,  
Growleth with vengeful intent fiercely th' insidious cur.

The peace was disturbed not only for the neighbors of the Park street, but also for the young Prince, at whose fête the trouble had begun.

The Prince was detained some weeks from the city. After his return, he lived in the quiet retirement that the duties of mourning imposed upon him. Lectures in his room were again resumed, but his place at Ilse's tea-table remained empty.

On the day when the University prizes were distributed, the students made a great torchlight procession to their Rector's house. The flaming lights waved in the old streets; the fanfares resounded, in the midst of which the lusty voices of the singing students might be heard; gables and balconies were lighted in colored splendor; the marshals swung their weapons gaily, and the torch-bearers scattered the sparks among the thronging crowds of spectators. The procession turned into the street towards the valley; it stopped before the house of Mr. Hummel. Again there was music and singing; a deputation solemnly crossed the threshold. Hummel looked proudly on the long stream of red lights which flickered about and lighted up his house. The whole honor was intended for his house alone, though he could not prevent the glare and smoke from illuminating the enemies' roof, also.

Upstairs some of the rector's most intimate friends were assembled; he received the leaders of the students in his room, and there were speeches and replies. While those assembled were crowding nearer to listen to the speech-making, the door of Ilse's room gently opened, and the Prince entered. Ilse hastened to meet him, but he began, without greeting:

"I have come to-day to bid you farewell. What I foresaw has happened. I have received orders to return to my father. To-morrow I and my attendant will take formal leave of the Rector and yourself, but I wished first to see you for a moment; and, now that I stand before you, I cannot express the feelings that prompted me to come. I thank you for all your kindness. I beg of you not to forget me. It is you who

have made the city so dear to me. It is you who make it hard for me to go away."

He spoke these words so softly that it seemed only as if a breath had passed into Ilse's ear; and he did not await her answer, but left the room as quickly as he came into it.

Outside, in the open place by the common, the students threw their torches in a great heap; the red flame rose high in the air, and the gray smoke encircled the tops of the trees; it rolled over the houses and crept through the open windows, and stifled the breath. The flame became lower, and a thin smoke ascended from the dying embers. It had been a rapid, brilliant glow, a fleeting fire, now extinguished, and only smoke and ashes remained. But Ilse was still standing by her window, and looking sorrowfully out upon the empty place.

## CHAPTER XXVI.

## THE DRAMA.

"He was a tyrant," exclaimed Laura, "and she was right not to obey him."

"He did his duty harshly, and she also," replied Ilse.

"He was a cross-grained, narrow-minded fellow, who was at last humbled; but she was a noble heroine, who cast from her all that was most dear on earth in order to fulfill her highest obligations," said Laura.

"He acted under the impulse of his nature, as she did according to hers. Hers was the stronger character, and she went victoriously to death. The burden of his deed crushed him during life," rejoined Ilse.

The characters which the ladies were discussing were Antigone and Creon.

The Professor had one autumn evening laid the tragedies of Sophocles on his wife's table. "It is time that you should learn to appreciate the greatest poets of antiquity in their works." He read them aloud and explained them. The lofty forms of the Attic stage hovered in the peaceful atmosphere of the German home. Ilse heard around her curses and heart-breaking lamentations, she saw a dark fatality impending over men of the noblest feeling and iron will; she felt the storm of passion raging in powerful souls, and heard, amidst the cry of revenge and despair, the soft chords of soul-stirring pathos sounding with irresistible magic.

The time had indeed come when Ilse could comprehend and enter into the feelings and fate of others than herself.

The bright rays of the midday sun do not always shine upon the paths of man. Not with the eye alone does he seek his way amid the shadows of night, but he hearkens, too, to the secret voices within his breast. From the battle of clashing duties, from the irresisti-

\* Translation copyrighted.

ble impulse of passion, it is not with most men a careful thought or a wise adage that saves or ruins; it is the quick resolve which breaks forth from within like an uncontrollable impulse of nature and which is yet produced by the compulsion of their whole past lives—by all that man knows and believes, by all that he has suffered and done. What forces us to the good or the bad in the sombre hours of trial, people call character, and the changing steps of the wayfarer through life as he seeks his way amid difficulty and danger, the spectator at the play calls dramatic movement.

He only who has wandered amid the flitting shadows of night, and has seriously listened to the secret admonitions of his inmost soul, can fully understand the spirit of others who, in a similar position, have sought to extricate themselves from an intricate labyrinth, and have found safety or met destruction.

Ilse, too, had experienced hours of fleeting terrors; she also had trembled as to whether she had pursued the right path.

The seventh tragedy of the Greek poet had been read; the boldest representation of bitter passion and bloody revenge. Ilse sat mute and horrified at the outbreak of fearful hatred from the heart of Electra. Then her husband, in order to recall her to less anxious thoughts, began: "Now you have heard all that remains to us of the art and power of a wonderful poetical mind, and you must tell me which of his characters has most attracted you."

"If you mean that in which the power of his poetry has most impressed me, it is always the newest form which has appeared to me the greatest, and to-day it is the monstrous conception of Electra. But if you ask which has pleased me most—"

"The gentle Ismene?" interrupted the Professor, laughing.

Ilse shook her head. "No, it is the valiant son of Achilles. At first he was tempted to yield to the cunning counsel of his confederate, and do violence to an unfortunate fellow-creature; but after a long struggle his noble nature conquers: he sees that it will be wrong, and he asserts his manhood by refusing."

The Professor closed the book, and looked with astonishment at his wife.

"There is," continued Ilse, "in the greatest characters of your Greek poet a stern rigidity that frightens me. Something is wanting in all to make them like us; they do not doubt as we do, nor struggle; even when they do right, their greatness consists in their immovable determination to do something fearful, or rigid persistence in stemming a terrible fate. But while we expect that the strong man shall act powerfully, according to his nature, either for good or evil, he does not gain our full human sympathy, unless we

have the certainty that he experiences an inward struggle such as we may ourselves feel."

"Such as we may ourselves feel?" asked the Professor, seriously, laying aside the book. "How do you come by this experience? Have you, Ilse, some secret from your husband?"

Ilse rose and looked at him with dismay.

But the Professor continued, cheerfully: "I will first tell you why I ask, and what I would like to know from you. When I brought you from your country-home you were, in spite of your deep German feeling, in many respects just such as we like to picture to ourselves Nausicaa and Penelope. You freely received impressions from the world around you; you stood sure and strong in a firmly-bound sphere of right and duty; with childlike trust you gathered from the moral habits of your circle, and from Holy Scripture, your standard of judgment and conduct. Your love for me, and contact with other souls, and the insight into a new sphere of knowledge, awakened in your heart passionate vibrations; uncertainty came, and then doubt; new thoughts struggled against old impressions, the demands of your new life against the tenor of your maiden years. You were for months more unhappy than I had any idea of. But now, when I have been rejoicing in your cheerful repose of mind, I find you have acquired a knowledge of human nature that astonishes me. I have often lately seen, with secret pleasure, how warmly you have sympathized with, and how mildly you have judged, the characters of the drama. I had expected that their hard and monstrous fate would have been repulsive to you, and that you would have felt rapid transitions from tenderness to aversion. But you have sympathy with the dark forms as well as with the bright, as if your soul had begun to anticipate that in one's own life, good and evil, blessing and curse, might be associated, and as if you had yourself experienced that man has not to follow an outward moral law alone, however exalted its origin, but that he may at some period be compelled to seek for some other law in the depths of his own soul. But such an insight men can only attain when they themselves experience danger and trouble. It is improbable that this should have been the case with you, unless you have gone through some experience to which I have been a stranger. I do not wish to urge your confidence; I know what trust I can repose in you; but if you think fit, I would gladly know what has given rise to this sensitive feeling for the secret struggles of men who are hurried along by a tragic fate."

Ilse seized him by the hand and drew him into her room. "It was on this spot," she exclaimed, "a stranger asked me whether he should expose himself to the danger of death for the sake of his honor, or

whether he should expose another in his place. I had given him a right to ask such a question, for I had before spoken to him of his life with greater frankness than was prudent for a careful woman. I stood and struggled against the question that he put to me, but I could not refuse to answer; and, Felix, to tell you the truth, I did not wish to do so. I gave him counsel which might have brought him to a bloody end. I gave him that advice secretly, and I became entangled in a fatal web from which I could not extricate myself. I thought of you, but I did not dare to tell you, as you must either have been unfaithful to the duties of your office, or you must for ever have wounded the honorable feelings of another. I questioned our holy teachings: they told me only that my advice was sinful. I was unhappy, Felix, that I had come into this position, but still more unhappy that neither you nor the teachings of my faith could help me out of it. It was no merit of mine that things turned out better than I feared they would. Since that I have known, Felix, what struggles of conscience are; now you know the only secret that I have ever had from you. If I did wrong, judge me mildly, for by all that is sacred I could not have done otherwise."

"And the Prince?" asked her husband, softly.

"He is a good and gentle soul, an immature man, while I was your wife. With him there was no doubt and no struggle."

"I know enough, you earnest, high-minded woman," said the Professor, "I see that, as against your knowledge of life, I can now pack up my books. For of what value is the teaching of books, however good they may be, in comparison to that of life. A foolish student's duel, in which you were the invisible adviser, has done more, perhaps to form your mind, than my prudent words would have done in the course of years. Be of good courage, Lady Ilse of Bielstein; whatever fate may still await us, I know now that you are fitted for inward struggles, and we need not be solicitous about dangers from without. For, however much we human beings may be troubled and agitated here on earth, he who has once learnt to know himself so well that he is able to read the secret writing of other souls, is well protected against the temptations of the world."

What the German scholar said as he now so warmly clasped his wife in his arms was not amiss, only it is a pity that we have no certainty of reading the secrets of other souls; and it is a pity that the greatest knowledge of the secret writing in the souls of others cannot serve us in warding off the storms of our own passions.

The Chamberlain, who now acted as marshal to the Hereditary Prince, was holding a conference with his father upon the concerns of his office. Among other things there was also the question of promoting

Krüger, of butter-machine fame, to higher honors and, what was of no less importance, to the full salary due the valet of an Hereditary Prince. Contrary to expectations the Sovereign was ready to agree to his proposals, and the Chamberlain, pleased at the gracious humor of his master, was about to take leave, when the Sovereign stopped him by the kind remark, "Your sister Malwine, looks ill; does she dance too much? You should take care of her delicate health; nothing would be more injurious to such a constitution than an early marriage. I hope to see her pleasant countenance at Court for a long time yet."

Now Fräulein Malwine was secretly betrothed to one of the Prince's officers; it was known at Court and in the city, but the betrothed were poor, and the consent of the Sovereign was necessary for their union. In order to obtain this it was advisable to await a favorable opportunity. Therefore the Chamberlain was alarmed at his master's words; he perceived a secret threat in them, and while he thanked him for his gracious sympathy, his face betrayed his dismay.

After the Sovereign, by this short turn of the peg, had tuned the strings of his instrument, he continued, with indifference: "If you have a quarter of an hour to spare, I wish you to accompany me into the cabinet of antiquities."

They passed through corridors and halls into a distant part of the castle, where, on an upper floor, a large collection of old coins, carved stones, and other minor relics of Greek and Roman times, were arranged. Many generations of rulers had contributed to it, but the greatest part had been brought by the Sovereign himself when returning from his travels. He had, in former years, taken great interest in the arrangement of these things, and spent large sums in purchasing others; but gradually this fancy had passed off, and for years the feather brush of the curator had only removed the dust for occasional strangers who had happened accidentally to hear of this almost unknown collection, and had honored it with a visit.

The Chamberlain, therefore accompanied his master with the feeling that this unusual idea signified something; and he felt a gloomy anticipation that what was impending boded no good. The Sovereign returned with a nod the low obeisance of the dilapidated curator; he passed in review the long rows of rooms, had some cases opened for him, took in his hand the written catalogue, and examined carefully the gold coins of Alexander the Great and his successors, and inspected a collection of old glass vessels and vases, in which the artistic work of the ancient glass-cutters was particularly striking. Then he asked for the strangers' book, in which the names of the visitors were recorded.

(To be continued.)

STUDIES OF HOLLAND.—By Edwin D. Mead.

I am a good angel  
making a flying trip  
in the interest of education. It is my  
special mission  
to proclaim that no  
family should be without a  
Hoyes Dictionary Holder. As  
an educational force its benefits  
are incalculable. If your book seller  
does not keep the Holder, send to H. H.  
Hoyes, 42 N. Monroe St., Chicago for  
a pamphlet containing a score of wise  
advice answering the question "Why should  
I use a Dictionary Holder?" So I confidently  
believe that no one can withstand the  
seductive arguments herein contained and  
not buy at least six Holders.

## Recent Contributions to 'The Open Court.'

THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 52, 53, 54 and 55.

In the whole domain of Natural Science no field  
of investigation affords such a fascinating com-  
plexity of phenomena or such a varied wealth of  
vitality as the Kingdom of the Protozoans, the mi-  
nute organisms revealed to us by the aid of the mi-  
croscope. They inhabit the water we drink, the  
food we eat, the air we breathe. They live as pa-  
sities in the intestines and flesh of animals, and in  
plants; aid or injure their hosts, as the case may  
be. They lie dormant in a particle of dust, a  
legion in number. They roam free and unconfined  
in a drop of water, to them a world. Infinite in  
number, variety of size and manner of appearance,  
the same being that the unaided vision of man  
cannot alone discover, form so important a factor  
in the construction of continents and in the con-  
figuration of the surface of the globe. They are  
the simplest known forms of life, and every con-  
tribution that throws light upon their mode of ex-  
istence, cannot fail to be of transcendent interest  
to biologist and scientist in general.

M. Alfred Binet, the collaborator of Ribot and  
F. B. C. and one of the most eminent representatives

of the French School of Psychology, has pre-  
sented in this series of articles the results of the  
most recent investigation into this department of  
Life. Every phenomenon that the improved  
methods of microscopic research have shown to be  
indicative of an exercise of intelligence, will, or  
feeling in these minute beings is fully discussed  
and analyzed. M. Binet has added much by these  
articles to the psychology of the microscopic world;  
he has opposed many theories, confirmed others,  
and advanced many conclusions of his own.—The  
articles have been translated from the *Revue Phi-  
losophique*, and the original cuts procured from the  
publishers.

PROF. WILLIAM D. GUNNING.

A Memorial Address by Frederic May  
Holland.....In No. 51.

Prof. William D. Gunning died at Greeley, Col.,  
on the 8th of March, 1883. His active and exem-  
plary career of sixty years was devoted to the ad-  
vancement of scientific thought, and marked by an  
uncompromising loyalty to truth. The memorial  
address, by Mr. Frederic May Holland, is a just and  
fitting tribute to a noble life.

### THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Problem  
of Causality. The surpassing importance of  
this subject renders a clear conception of it abso-  
lutely indispensable to correct observation and  
sound reasoning. Despite this the problem has  
been unbecomingly neglected, and this neglect has  
given rise to innumerable errors and to an astound-  
ing lack of lucidity in scientific discussion. The  
problem is treated with clearness and precision;  
simplicity of presentation being especially aimed  
at.

The comments and discussions elicited by the  
article on "Causality" will be found to be espe-  
cially instructive and elucidative. In Nos. 58, 59, and  
60, Mr. William M. Salter advances a series of criti-  
cal remarks, which are replied to in the same num-  
bers by the articles, "Causes and Natural Laws"  
(No. 50). "Is There Anything Unknowable in Cau-  
sation" (No. 59). "Is Nature Alive," and "The  
Stone's Fall" (No. 60). In No. 58, Mr. M. A.  
Griffen writes a letter upon the same subject. In  
No. 60, Dr. Edward Brooks, of Philadelphia com-  
ments upon the standpoint taken: all of which are  
accompanied by editorial comments.

### DRUMMOND'S NATURAL LAW IN THE SPIRITUAL WORLD.

JAMES HERBIN.....In No. 56.

An instructive criticism of a book "that has cre-  
ated a sensation in certain orthodox circles, and  
which, when superficially considered, has the ap-  
pearance of substantiating certain Christian dog-  
mas by scientific analogies." Mr. Herbin points  
out the inconsistencies resulting from the further  
development of Drummond's doctrines and men-  
tions several natural principles which were not ad-  
mitted into the analogy.

### REMINISCENCES OF MR. ALCOTT'S CON- VERSATIONS.

MRS. EDNAH D. GRENEY. In Nos. 49 and 50.

In Nos. 49 and 50 THE OPEN COURT publishes a  
paper upon Mr. Alcott's conversations, read by Mrs.  
Ednah D. Cheney before the Memorial Meeting of  
the Concord School of Philosophy. Mrs. Cheney's  
recollections of Mr. Alcott lead us back as far as  
the year 1840. The reminiscences cover almost a  
half a century of Mr. Alcott's intellectual life.  
Abstracts are given of his conversations, incidents  
described in which noted contemporaries figured,  
and anecdotes told illustrative of Mr. Alcott's life  
and thought.

Wheeler, in No. 52, contributes an addi-  
tional reminiscence of this "amiable philosopher  
and venerable man."

## LEE &amp; SHEPARD'S NEW PUBLICATIONS.

## A WESTERN BEAUTY.

**DAYS SERENE.** Original illustrations by MARGARET MACDONALD PULLMAN. Engraved on wood by George T. Andrew, and printed under his direction. Royal oblong quarto. Emblematic cover. Twenty-six full-page, original illustrations. Full gilt. Size, 10½x14½. Cloth, \$5.00; Turkey morocco, \$12.50; tree-calf, \$12.50; English-seal style, \$9.00.

## SEPIATINT NOVELTIES.

Something new, attractive, and decidedly original.

**A CHRISTMAS CAROL.** By DINAH MARIA MULLOCK, author of "John Halifax." Illustrated by J. Pauline Suter. Printed on heavy board in sepia tint and gold, gilt edges, ribboned and boxed, \$1.00.

**"A FRIEND STANDS AT THE DOOR."** By DINAH MARIA MULLOCK, author of "John Halifax." Illustrated by J. Pauline Suter. Printed on heavy board in sepia tint and gold, gilt edges, ribboned and boxed, \$1.00.

**ALL AROUND THE YEAR.** A charmingly illustrated calendar for 1889. By J. PAULINE SUTER. Consists of beautiful original designs, on heavy board, in sepia tint and gold, gilt edges, ornamented with rings and chains in silver, with silk tassels, and boxed, 50 cents.

**THE REGAL BEAUTIES.** Printed on extra super-calendered paper at the University Press. Gilt edges. 50 cents each.

A title justly designating one of the most original and beautiful styles of LEE & SHEPARD'S HOUSEHOLD FAVORITES yet offered. The size is large 4to, 22x14 inches. The covers are the best quality of heavy Bristol-board with pebbled surface, ragged edges, and original water-color designs by American artists, each cover containing two beautiful pictures. The following eight favorites have been selected for this unique style:

*Nearer, My God, to Thee; Home, Sweet Home; Dora; by TENNYSON; Rock of Ages; Abide with Me; Curfew Must Not Ring To-Night; O Why Should the Spirit of Mortal be Proud?; The Glorious Song of Old; It was the Calm and Silent Night; The Breaking Waves Dashed High; King David; Wild Belts; Abide with Me.*

**THE DAINY MINIATURES** include twelve of LEE & SHEPARD'S FAVORITES in particularly attractive dress. Covers of heavy Bristol-board with pebbled surface, ragged edges, and decorative illustrations in manifold water-colors and gold.

These little volumes are "as dainty as the leaf of a lily," of exquisite design, each cover displaying a work of art. The favorites selected for this style are:

*Curfew Must Not Ring To-Night; Rock of Ages; Gray's Elegy; O Why Should the Spirit of Mortal be Proud?; Home, Sweet Home; Nearer, My God, to Thee; My Faith Looks Up to Thee; The Glorious Song of Old; It was the Calm and Silent Night; The Breaking Waves Dashed High; King David; Wild Belts; Abide with Me.*

Price, envelope, gilt edges, 25 cents each. Illustrated on every page.

## The "Peerless-Jerome" Art-Books.

## NEW EDITIONS.

All original illustrations engraved on wood. Miss Jerome will publish no new book this season, she being entirely occupied in the preparation of a work for next year which is confidently expected will surpass all her former works.

**A Bunch of Violets.**

Gathered by IRENE K. JEROME. 4to, cloth, \$3.75; Turkey morocco, \$9.00; tree-calf, \$9.00; English-seal style, \$7.00.

**One Year's Sketch Book.**

In same bindings and at same price as "Nature's Hallelujah."

**Nature's Hallelujah.**

Elegantly bound in gold cloth, full gilt, gilt edges, \$6.00; Turkey morocco, \$15.00; tree-calf, \$15.00; English-seal style, \$10.00.

**The Message of the Bluebird.**

Told to Me to Tell to Others. Cloth and gold, \$2.00; Palestine boards, ribbon ornaments, \$1.00.

## LEE &amp; SHEPARD'S GOOD COMPANY.

Neat volumes, good type, cloth binding, 50 cents each.

**Fireside Saints.**

Mr. Caudle's Breakfast Talk, and Other Papers, by DOUGLAS JERROLD.

**The Wishing-Cap Papers.**

By LEIGH HUNT.

**The Lover.**

By RICHARD STEELE.

**Dreamthorpe.**

By ALEXANDER SMITH.

**"Nicht läuten darf die Abendglock' heut' Nacht."**

*"Curfew Must Not Ring To-Night."* (In German.)

Eine Ballade von ROSA HARTWICK THORPE, aus dem Amerikanischen übersetzt von Hugo Erichsen, with all the original illustrations of the English reading. Cloth, full gilt, \$1.50.

## LEE &amp; SHEPARD'S White and Gold Series.

Illustrated, and bound in white, black, and gold, with new and original designs, each \$1.50.

**Adventures of a Chinaman.**

By JULES VERNE. 40 full-page illustrations.

**Lives of the Presidents.**

From Washington to Cleveland, with new portraits.

**Fighting Phil.**

The life of General Philip H. Sheridan. By HEADLEY. With illustrations.

**Perseverance Island, or, The Robinson Crusoe of the 19th Century.**

By DOUGLAS FRAZER. With illustrations.

**Our Standard-Bearer.**

Oliver Optic's Life of Gen. U. S. Grant. With illustrations.

**A Modern Adam and Eve in a Garden.**

By MISS DOUGLAS. 12mo, cloth, \$1.50. Uniform with

**The Douglas Novels.**

12mo, cloth, 18 volumes, \$1.50 each.

**Manners; or, Happy Homes and Good Society all the Year Round.**

By SARAH J. HALE. Cloth. \$1.75.

**The Reading Club, and Handy Speaker No. 19.**

Edited by G. M. BAKER. Paper, 15 cents.

## NEW JUVENILES.

OLIVER OPTIC'S NEW "BLUE AND GRAY" SERIES.

**First Volume—**

**Taken by the Enemy.**

Cloth, illustrated, \$1.30.

**A Start in Life.**

By J. T. TROWBRIDGE. New Volume. Illustrated. Price, \$1.00.

## PENN SHIRLEY'S NEW STORY.

**Little Miss Weezy's Brother.**

By the author of "Little Miss Weezy." Cloth, illustrated, 75 cents.

**The Story Mother Nature Told Her Children.**

By JANE ANDREWS, author of "Seven Little Sisters," etc. Cloth, illustrated, \$1.00; school edition, 50 cents, net.

**The Year's Best Days.**

Stories and Poems for Young People. By ROSA HARTWICK THORPE, author of "Curfew Must Not Ring To-Night," etc. Cloth, illustrated, about \$1.00.

**Up the North Branch.**

By CAPTAIN CHARLES A. J. FARRAR. Illustrated, \$1.25.

## CHRISTOPHER P. CRANCH'S STORIES.

A NEW EDITION.

**The Last of the Huggermuggers.**

Illustrated, \$1.00.

**Kobolotozo.**

A sequel to "The Last of the Huggermuggers." Profusely illustrated, \$1.00.

**The King of the Golden River.**

By JOHN RUSKIN. Cloth, gilt, \$1.00.

## Recent Contributions to 'The Open Court.'

## GHOST STORIES.

By L. J. VANCE. . . . In Nos. 39, 60 and 61.

The object of these studies in Comparative Folklore is not to account for every detail of every wild and senseless ghost story. Their purpose is to classify and compare the ghost lore of civilized and uncivilized peoples, and to show that the legends of the former are evolved from the savage fancies of

the latter. The belief in the power and permanence of the souls of the dead is characteristic of savage nations. These beliefs have been retained by the uncivilized folk of more advanced civilizations, and the senseless parts of their earlier and cruder form. The main thesis of these investigations is, that the "supernatural stuff" of ghost stories is the same the world over,—whether in the hut of Bushman and Hottentot, or in the more elaborate illusions of a modern drawing-room saloon.

## THE ETHICAL BASIS OF CHARITY.

W. ALEXANDER JOHNSON.

The Editor of *The Reporter*, an organ of Organized Charity, Chicago, speaks not only from experience but takes the scientific aspect of this most vital problem. The basis of Charity must not be sought for in the sustenance of a pauper class who would not exist but for charity. The basis of Charity must be sought for in ourselves and our ethical nature. To this truth the principles and methods of doing the work of Charity must conform.

## ROBERTS BROS.' NEW BOOKS.

READY OCTOBER 1st.

### FRANKLIN IN FRANCE.

SECOND PERIOD. From the surrender at Yorktown until his return to America. From original documents. By EDWARD EVERETT HALE and EDWARD E. HALE, JR. With a fine portrait of Franklin in his old age, by Duplessis, never before engraved, and numerous illustrations. 1 vol. 8vo. Cloth, gilt top, uniform with the first volume. Price, \$5.00. This volume completes the work. Also just ready, a second edition of

### Franklin in France, First Period.

Which the *Cambridge Tribune* calls "a valuable and noteworthy addition to the literature of history."

### THE BOOK OF CHRISTMAS.

Descriptive of the Customs, Ceremonies, Traditions, Superstitions, Fun, Feeling, and Fesivities of the Christmas Season. By THOMAS K. HERVEY. With all the original illustrations by R. Seymour. 12mo. Cloth. Price \$2.00. This is a new edition of a clever book by the poet Hervey, long out of print, probably the best account ever written of the now universally celebrated Christmas Season.

### SPARROW, The Tramp.

A Fable for Children. By LILY F. WESSELHOFF. With illustrations by Jessie McDermott. Square 16mo. Cloth. Price, \$1.25. "One of the most thoroughly delightful child stories we have had for many a day is 'Sparrow, the Tramp,' by Lily F. Wesselhoff. It is one of those charming books in which animals talk, and it adds the novel scheme of having them influence the affairs of their human neighbors in a way which will delight the little folks. It is refreshing to find a child's book which is at once so novel and so beautiful as is 'Sparrow, the Tramp,' says the *Boston Courier*.

The illustrious author of "Little Women" read the manuscript of this little story with great delight.

### PRINCE VANCE.

The Story of a Prince, with a Court in his Box. By ELEANOR PENNAB and ARLO FARR. With numerous illustrations by Frank Myrick. Small oct. Cloth. \$1.50. One of the most charming stories of the season for the young folks.

## RAYMOND KERSHAW.

A Story of Deserved Success. By MARIA McINTOSH COX. With illustrations by F. T. Merrill. 16mo. Cloth. \$1.25. "Raymond Kershaw" is a story of brave living, noble action, hard work, and devoted family affection. It begins in sadness and ends in joy, and it is thoroughly sweet, pure, and helpful.

## LEAR'S NONSENSE BOOKS.

Comprising "A Book of Nonsense," "Nonsense Songs, Stories, Botany, and Alphabets," "More Nonsense Pictures, Rhymes, Botany, etc.," "Laughable Lyrics—A Fresh Book of Nonsense Poems, Songs, Botany, etc." By EDWARD LEAR. With all the original illustrations, a sketch of the author's life, and a portrait. Complete in one volume. 12mo. Cloth. Price, \$2.00.

The late Mr. Lear wrote four "Nonsense Books." Two of them are new to American readers, and the four are here reproduced in a compact library form at a moderate price.

## THE PENTAMERON.

Citations and Examinations of William Shakespeare. Minor Prose Pieces. Criticisms. By WALTER SAVAGE LANDOR. 12mo. Cloth. Price, \$2.00. This volume, "Imaginary Conversations" (five vols.), and "Pericles and Asopias" (one vol.) comprise Landor's entire prose writings.

## BEAUCHAMP'S CAREER. THE EGOIST.

Two more novels in the Author's POPULAR EDITION OF GEORGE MERRETT'S WORKS. Already published: "Richard Feverel," "Sandra Belloni," "Harry Richmond," "Rhoda Fleming," "Vittoria," and "Evan Harrington." 12mo. Cloth. Price, \$1.50 each.

Sold by all booksellers. Mailed, post-paid, on receipt of price by the publishers.

## The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.

169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

## PRESS NOTICES.

- "Fall of novel thought."—*Chicago Herald*.  
 "The subject is discussed with great clearness and simplicity."—*Book Chat*.  
 "The absurdity of the theory is manifest."—*New York Science*.  
 "No other writer concentrates so much in such simple language."—*Baltimore Sunday News*.  
 "The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic*.  
 "Max Müller's supremely simple theory is hotly disputed, — but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon*.  
 "The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times*.  
 "The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star*.

THE OPEN COURT.

PUBLISHED EVERY THURSDAY BY

THE OPEN COURT PUBLISHING CO.

EDWARD C. HEGELER, PRESIDENT.

DR. PAUL CARUS, EDITOR.

THE OPEN COURT is a radical journal which holds that Religion and Science, rightly understood, do not contradict each other. The apparent divergencies have arisen from the false dualistic conceptions of world and life; and the Conciliation of Religion with Science is to be found in *Monism*—to present and defend which is the main object of THE OPEN COURT.

*Monism* is that view which recognizes the Oneness of All-Existence.

As a Philosophy, *Monism* is the basis of modern science. It teaches that truth is one and the same. One truth can not contradict another truth. Cognition must agree with facts and be free from self-contradiction, constituting a clear and systematic conception of Reality.

As a Religion, *Montism* teaches that the individual is a part of the whole. The individual must conform to the laws of the All in order not only to live, but also to lead a moral life—a life that is worth living.

The religion of *Monism* thus becomes the scientific basis of Ethics which regulates the relations of the individual to his fellow-beings as well as to the cosmical laws of the All.

Translations from the most prominent authors of Europe have been procured, and efforts are made to present the very best and most advanced thought bearing on scientific, religious, social, and economic questions.

#### RATES OF ADVERTISING.

P. O. DRAWER F.

CHICAGO, ILL.

FORMER CONTRIBUTIONS TO "THE OPEN COURT."

GUSTAV FREYTAG.

Commencing with No. 22 is a philosophic novel by Gustav Freytag. In this refined and interesting story the reader becomes acquainted with some strongly marked personalities, and hears from them some rich and rare philosophy. "What is the object of philosophy?" says Frau Rollmaus to the Professor.

"It endeavors to instruct men in the life of their own spirit, and thus to strengthen and improve them."

In the actions, conversation, and adventures of the characters we see this philosophy guiding, teaching and improving them and us. Here through the easy and pleasant method of novel reading we learn the secret inspiration which produces those wonderful phenomena, which hitherto have been considered the mysteries of life; here we see destiny directed and controlled by law, and all the phenomena of natural and physical life are comprehended as phases of one and the same. This monism or conception of the oneness of all life and all nature pervades all pages of this wonderful work of fiction.

FR. HELBIG.

In Nos. 22, 23, and 24 is a deeply philosophical essay, "The Fool in the Drama," by Franz Helbig, another German scholar whose works refer to the History of Civilization. In this essay are shown in a delightful way the wisdom and the folly of the fool in the drama, and his value, not only to the body politic, but to the morals of human life. In the folly of the fool in the drama we see our own folly; and the satire of the fool administered in jest leaves a lesson behind it that makes us think seriously when he laughter is done.

WHEELBARROW.

"WHEELBARROW" speaks to the laboring men from the standpoint of a laborer, although he does not work with a shovel and wheelbarrow now. In his first essay, published in one of the early numbers of *THE OPEN COURT*, he says: "I sign my name 'Wheelbarrow' because that is the implement of my handicraft or was when I was a strong man. I was by profession a 'railroad man'; my part in the railroad business was making the road-bed by the aid of a pick, a shovel and a wheelbarrow." We quote this passage because from our personal acquaintance with "Wheelbarrow" we understand that it is literally true.

"Wheelbarrow" treats the labor question in a manner peculiarly his own, with illustrations drawn from every-day experience and presenting a moral which may be seen at a glance. He advises the working men in a friendly, persuasive way, and criticizes many of their methods of reform as harmful to themselves, tyrannical and unwise. These essays have been much admired, not only by the working men, but also by men eminent in American literature. In an editorial article on "Wheelbarrow," the *Boston Herald* said: "He possesses in a striking degree the rare ability of being able to treat of complicated matters in so lucid and simple a manner as to make them easy of comprehension to those who have never before given the subject much thought. Last year he published a series of tracts on the labor question which were widely read, but not half so widely as they deserved to be. Treating of his subject from a working man's standpoint, he displayed an extraordinary wealth of apt but homely illustrations."

C. K. WHIPPLE

"Progressive Orthodoxy," by C. K. Whipple, in No. 25, is a very keen and rather sarcastic censure on "The American Board of Commissioners for Foreign Missions." The said "Board" declined to comply with the request of their missionaries to make a few changes in the plan of saving the savages. These innocents, it was experienced, object in an absurd benevolence to the plan of eternal damnation, so as to be lost for Christianity. Mr. Whipple, it seems, did not consider that the Board could not have acted otherwise, for it would have been an outright confession that the savages had converted the missionaries, a most illogical and very improper thing to do.

WILLIAM L. POTTER.

In the leading essay of No. 1, Mr. Potter discusses the question of the relation of individual existence to the aggregating power and well being of society. Nature in this matter should be our teacher, and the spinal world-plan of nature is the method of differentiation. It is a process of concentrating the forces of existence which is done through the process of self-preservation. This principle of selfishness means only, not an end. Without it there would be stagnation, but the individual organism does not exist for its own sake. Nature's aim is higher, broader, richer life. The end of individual existence is the common good, the general well-being, and here is where the law of ethics and the obligations of religion bear upon social problems. Individual self-interest and enterprise only furnish the rough materials for the meliorations which mark the progress of the higher civilization.

## THE MARRIAGE PROBLEM.

BY E. D. COPE, PH. D.

Religion and Love are the two subjects on which it is most difficult to think or to speak rationally, or without prejudice. This is, because the personal interests which both involve, are of a sentimental or emotional nature; secondly, because the facts necessary to the understanding of both questions, are difficult to obtain. Sooner or later experience throws much light on the nature of the passion that expresses itself in marriage, but unfortunately for the inexperienced, such knowledge is for various reasons seldom available for their use, so that correct thinking on the subject has not advanced with the same rapidity as has been the case with many other questions. The fact is, that to-day our civilization is, in this direction, still imperfect, and, in my opinion, in many localities is little better than barbaric. It is barbarism of thought to be seen at both ends of the social scale; in the conventionally orderly, as well as in the socially depraved. But in the former class it is due, rather, to thoughtlessness, while in the latter class it has various causes.

All human institutions rest on a basis of natural law. They owe their existence, as well as their limitations, to unavoidable material conditions. In considering the problem of marriage, I will state first the natural conditions which define it. I will then discuss the various methods of carrying it into effect adopted by mankind. This part will be followed by a consideration of the future of the institution.

### I. THE FOUNDATION FACTS OF MARRIAGE.

In discussing this, as well as other aspects of the subject, I must first ask the indulgence of my readers, if I state many things which are common knowledge, for the sake of completeness. I will also observe, that in order to reach rational conclusions on the subject it is necessary that unreasoning prejudices must be laid aside by both sexes, even what one might call good prejudices, such as gallantry on the part of the man, and conventional reasons for action on the part of the woman.

Of course, the given factor in the subject is the existence of intersexual love. Its strength differs in different races and families; but people, in whom it is

not strong, certainly form a minority of the human race. This is likely to remain the case, since people of cold temperament do not, in the long run, propagate their kind so rapidly, as do others. Of the strength of the passion in both sexes every person of experience is fully aware. Two instances of recent occurrence may be cited. A woman was examined, in New York, as a witness against her husband, who had gouged out both of her eyes in fits of passion. She perjured herself in court by saying, that her shocking condition was due to accident, and was not the fault of the man! John L. Sullivan, the pugilist, lying at the point of death, receives a priest to administer to him the Roman Catholic sacrament of extreme unction. The priest demands, as a necessary condition, that he shall dismiss and discard the lady who attended him, who was his wife except in the absence of the necessary legal authorization. This Sullivan refused to do, preferring to take the (to him) risk of eternal perdition, rather, than turn away, even for a few hours, the woman he loved.

The evolutionist sees in the intersexual passion a mental outgrowth of the physical necessities involved in the function of reproduction. An analysis of the nature of this physiological necessity can only be entered into here very superficially. In non-sexual animals, at the bottom of the scale, the division of one individual into two, has been perhaps a simple rupture, owing to the incapacity of protoplasm to retain its continuity, after a certain bulk has been reached. Wherever there is consciousness, the accompanying strain would occasion pain, and the animal would use some effort to throw off the superfluous part of its substance, the result being a feeling of relief. With advancing complexity of organization this process, like all others, would become specialized, and certain cells only would be discharged as supernumerary and unnecessary to the functions of other parts. Thus reproduction early became a form of relief from a growing body or bodies which occasioned pain or discomfort while present. The origin of the male sex is as yet a total mystery; but the burden of reproduction came to be shared by him also, and it became necessary that he also should obtain relief from discomfort and pain by throwing off parts of his organism.

Whatever might have been the cause of the origin

of a male sex, its result is well understood. Reproduction by two sexes doubles the influences of heredity, and gives the offspring twice as many chances for variation in structure as is possible in reproduction by one sex. The male, moreover, being free from the disabilities and duties of maternity, has always had opportunity for more varied pursuits, and more continuous muscular and mental activity. He has been the hunter and the fighter in primitive society, and in civilization the organizer and the builder of machines, of houses, and of governmental systems. Some women imagine that all these things might have been done by women if they had only been permitted, or had had opportunity to do so, etc. But it is nature that has deprived them of the opportunity, and women's disabilities in these directions are not of human, but of natural origin.

The mutual service rendered by the sexes to each other is so great that the origin of their mutual interest is readily accounted for. Development of the mind has not rendered these services any the less effective, but it has extended the mutual interest to a higher plane. The affection which many of the lower animals display toward each other, as well as to men who give them pleasure, is greatly increased in the social relation of men by recognition of the mystery which surrounds it. The continued devotion of the sexes to separate functions in the social organism has been followed by their better adaptation to those functions and their increasingly greater difference of structural characters. Thus the sexes have become more and more useful, and more and more interesting, to each other. This diversity has distinctly increased among civilized men, as appears from the measurements of various parts of the body, notably of the skeleton, made by Broca, and others.

The intersex interest has an especial and important influence on human mental evolution. Man, like other animals, is lazy, unless stimulated by some urgent necessity. Hunger furnishes the usual goad, but man has had much time on his hands for occupation other than the obtaining of food. In the process of carrying out his various schemes of possession, of control, and of the conquest of nature in different directions, he has naturally come into frequent collision with his fellows. In all times, both ancient and modern, men have been rivals and antagonists in all fields. The stimulus to human development from this source has been compulsory. Men have either grown great under it, or have weakened and died. The struggle for existence is real, and the survivors are "fit"—for something. The relations of the sexes furnish the relief to this picture. So long as each sex has maintained its natural relations to the other, life has been worth living, and other kinds of fitness have been

effective in determining the survival of men. Love has stimulated men and women to good deeds and to good and useful lives; and as a stimulus to the mental faculties it has been second only in importance to the brute force of the struggle for the necessities of life and for power.

In order to retain the important influence of the sex-interest on human development, it is necessary that the sexes should retain their special characteristics and endeavor to maintain the highest degree of mutual utility. This result will be largely attained by natural processes; for a people, in whom the sexes should not easily co-operate, would be likely to diminish in population, or become absorbed by others. But, though nature may not be absolutely defeated, she may be so perverted and misused, as to cause a great deal of suffering to men. And this has occurred in many cases in the marriage relation. But in order to understand just what is practicable in this direction, we may take a glance at the natural characteristics of the sexes. It must be remembered, that in the attempt to generalize, from such a vast number of instances, one can only give averages, and cannot consider exceptions.

In brief, the struggle with nature has given the male of man superior muscular strength and superior rationality. Both have been forced upon him, the first by exertion, the second by experience. Necessity has also compelled him to undergo labor of body and of mind for long continued periods, so that his powers of endurance have been cultivated. Knowing the danger of physical conflict with his kind, he has learned to exercise a certain control of his manners and language. As regards women, their maternal instinct and the care of children have cultivated their affections rather than their rational faculties. Their occupations, although often laborious, have been generally less severe than those of men; hence results their inferior muscular strength, which is from two-thirds to one-half that of a man of the same race and condition. Their affectional nature has led women to cultivate the aesthetic and to excel in the adornment of their persons, and their homes. For natural reasons they have become more cleanly than man, more refined, and more attentive to small matters. The general effect of the preponderance of the emotional element in the female mind is to render it more liable to the temporary loss of the coördinate action of its parts, than in the man. This fact is illustrated in the greater ease with which women fall into tears, syncope, hysteria, etc. On the other hand, women learn many things with great facility, and are quite as skillful in the use of language as men.

The relative peculiarities of the sexes in men differ somewhat in different races. The male Chinaman is deficient in some of the external marks of his sex (as

beard, etc.), and it may be that his mind has a similar peculiarity. But when men resemble the women of higher races in character, we can anticipate that the women will resemble grown up children. It is possible that in some races women are more masculine than is the case elsewhere; but if such be the fact, the evidence is not yet accessible.

The general result of comparison is, that the male of the species man possesses the qualities which give him control over the female, both in body and mind; and through his control of nature which comes of energy directed by persistent intelligence, woman is completely at his mercy. It is sometimes said that civilization has changed this relation, and that the possession of money and machinery places woman on an equality with man in the matter of force. In particular cases such results would follow the conditions referred to, but the general relation cannot be much affected. Money is the representative of organized labor, and it is the male whose labor is most valuable, and it is he who controls and organizes labor. Machinery is purchased by money, and mostly requires strength and precision in its use, so that here also the preëminence of man remains. The number of women who are the architects of considerable fortunes is very small.

But in spite of this subordination, the position of woman is not a hard one. She is so necessary to the man, and when she makes the effort, so pleasing to him, that he makes sure to have her society; and even among the lower races he will support her so far as is necessary to enable him to have her with him. He desires generally to support their children, and will protect both from danger and injury. Among the highest races this sentiment is so developed that the woman entirely escapes the responsibility of support of herself and her children, and thus leads a life that is free from most of the strains and anxieties that naturally fall to the lot of the man. Of course the extent to which women experience this immunity is very various, even in civilized communities. Thus the specialization of the sexes becomes complete, and their minds are modified accordingly. This specialization, it be remembered, is beneficial as an element of evolution, so long as the principle of mutual utility is conserved. It is of course evident that too great a difference of sex characters would destroy mutual interest; and this actually occurs in some parts of the world, where women are secluded, or deprived of the education which is necessary to enable them to be companions of men of intelligence.

The generous elements of the character of the man have been developed by the dependence on him of wife and children; and from a domineering savage he has grown to repose affection and confidence in his

family. This is so much the case that the ordinary customs of civilized peoples give woman a preference in many matters of every-day occurrence, which is an expression of a strong sentiment of especial consideration. That this position of vantage in the esteem of men has not arisen from the exercise of physical or of preponderating intellectual force on the part of women, is a self-evident proposition.

## II. SYSTEMS OF MARRIAGE.

Marriage, as an agreement between men and women for the satisfaction of a passion which they rarely attempt to analyze, may be accomplished in various ways. I premise here that the assumption of the Roman Catholic Church that it is performed for the sole object of propagation of children, is very wide of the truth. This reason is probably uppermost in the minds of very few persons who marry. And, as a question of fact, the production of children is but one of several benefits which it confers on mankind, as has been already stated above.

Marriage may be temporary or permanent; it may consist of one of each sex (monogamy); one man and more than one woman (polygamy); or one woman and more than one man (polyandry); or it may be an undefined and unrestricted relation between different men and women (heterogamy). In human society which is at all organized, a definite relation which shall permit the recognition and support of children is held to be necessary. Men do not take upon themselves the support of the wives and children of other men, and if the fathers of children cannot be determined, their support falls on the mother. Her own support also in that case depends upon herself, and she is forced into a position in the world like that occupied by the man, with the additional burthen of a child, and the disadvantage of inferior strength with which to combat nature. The fact that woman is the child-bearer, and that man is not, renders their relation to the marriage contract different. It also renders heterogamy and polyandry disastrous to the well-being of women and children, while polygamy and monogamy preserve the interests of both. In other words, justice compels the support of women and children by a man, so long as they are known to be his; but when this fact cannot be ascertained, he is under no obligation to do so. On this obviously just principle the vast majority of social organizations have been erected. Polyandry has flourished in a few localities, for limited periods, while heterogamy has been generally outlawed, even among very primitive races. This fact has, however, not prevented the hetæra from having been a more or less conspicuous person in history, and her trade is prosperous to-day in the most civilized communities. This fact results from two causes, apart from want of

self-control, and from poverty. They are, first, the nomadic habits of many men; second, the forced associations imposed by an extreme monogamy. That heterogamy is disastrous to children, and so is inconsistent with a healthy growth of population is clear enough. That it is highly injurious to the female mind is not less certain; and that it becomes finally an insufficient means of support, is also equally evident. It is an institution which might be largely replaced by better systems were rational attempts made to do so. In regions where women are in excess and their surplus is not self-supporting, a voluntary and properly defined polygamy would be better than the state of affairs which now exists. I say *voluntary* polygamy, the adjective of course applying to both sexes. Where the institution at present exists, it is usually voluntary on the part of the man, but not, or but partially so, on the part of the woman. This is a wrong to woman, who should, to a certain extent, have entire liberty of choice in the matter of her marriage. I say to a certain extent, for it might happen, though almost inconceivable, that all the women of a given locality, few or many, might refuse to become mothers. In that case I suppose the scriptural injunction to "increase and multiply" would be regarded by many men as sufficient justification for rape. By others its justification would stand on the same basis as that for the commission of murder in self-defense, or the stealing of bread by a starving man.

The historical origin of monogamy is an interesting question that can be but lightly touched on here. It is easy to understand that among tribes and nations in the state of war which seems to have characterized primitive man, the marriage relation would be more or less unstable. Out of chaos would originate polyandry, polygamy, and monogamy. It is said that polyandry was a result of a deficiency of women, in consequence of female infanticide. It has given way almost everywhere to the other two systems, for the reasons already given. Under polyandry the man has no inducement to accumulate property for children, and industry must ever remain at a low ebb. It is evident that its abandonment must have been partly due to the development of a higher regard for women on the part of men. So, also, the transition from polygamy to monogamy may be regarded as certainly due to the same cause. The development of this interest was naturally accompanied by its complementary trait, jealousy, between men. This increase of the self-interest on the part of men must have been largely due to the advance of woman herself, which I very strongly suspect has ever been the prime factor in social development towards monogamy. In this respect woman leads man, not by direct force, as already remarked, but by the exhibition of those

attractions which are adapted to the wants of his nature.

(To be concluded.)

## FORM AND FORMAL THOUGHT.

### I.

#### KANT'S CRITIQUE OF PURE REASON.

In the introduction to his "Critique of Pure Reason," Immanuel Kant proposes the question: How are synthetical judgments *a priori* possible? On the solution of this problem the whole structure of his philosophy rests, which he characterizes as *Transcendental Idealism*.

'A priori' means 'beforehand,' and its opposite 'a posteriori' means 'afterwards.' To know something *a priori* means to know something before any experience thereof has been had. When we know that the specific gravity of ebony is greater than that of water, we can declare *a priori*, that ebony will not float, but sink to the bottom (the physical law being also considered known). We can even know it *before* the experiment is made. The experiment will afterwards, *i. e.* *a posteriori*, verify our knowledge.

This is the general meaning of the terms 'a priori' and 'a posteriori.' But Kant uses the words in a more limited sense.

In Kant's language the term 'experience' is employed to signify sense-perception. It is not exactly limited to that meaning throughout, but certainly it is always used in opposition to non-sensory or mere formal knowledge. That which produces experience, and which as a reality outside of us and independent of our sensation corresponds to sensory impressions, Kant calls 'matter.' Therefore, we have knowledge of the existence of matter and its different properties 'a posteriori,' or from experience, *i. e.* from sense-perception only.

There is another kind of knowledge, however, which is not sense-knowledge, but formal knowledge. Formal knowledge can be gained by abstraction. The form of things, such as globes, cubes, statues, and other bodies, can be abstracted from their material reality. We can, for instance, think away all things in the world. (We abstract from their material existence.) What is left is 'empty space'; and this conception of pure space is the postulate of a science that is called mathematics. We can abstract, also, from all processes which take place in the world; what is left is the idea of duration only; it is 'empty time,' in which these processes might have taken place. The conception of time, pure and simple, can be conceived as a progress through empty units without reference to real phenomena. Such empty units are called numbers, and by adding one unit to another, we start a process that is known as counting. Counting is the basis of arithmetic. If, again, we abstract from the substance of our thoughts,

the mere forms of thought remain, which, treated as a science, are called formal logic.

It must be remarked in passing that Kant calls space and time 'pure perceptions' (*reine Anschauungen*), while the categories are treated as 'pure conceptions' (*reine Verstandesbegriffe*). This distinction is justifiable for certain purposes, and should not be slurred over by commentators of Kant's philosophy. However, our present purpose is not to explain or popularize the Critique of Pure Reason, but to use its more prominent ideas for propounding our own views which grew out of a study of Kant's Transcendentalism. We may add that every perception, as soon as it is named and clearly defined, becomes a conception. Space can be the basis of mathematics, and time of arithmetic only when both have grown to be clear conceptions.

Formal knowledge is called by Kant a priori, because, if any truth of these formal sciences is established, it will be known to be true for all possible cases of experience, even before the experiments have been made. The rules of mathematics, of arithmetic, and logic, possess rigid necessity and absolute universality. They are the condition of all scientific investigation; for rigidity and universality (*Nothwendigkeit und Allgemeinheit*) in experimental sciences can be realized only through the assistance of the formal sciences. Astronomy and chemistry, for instance, have become sciences only by the application of mathematics and arithmetic; and where can any kind of science be found that could dispense with logic?

A priori, as used in the limited sense by Kant, is purely formal knowledge, while a posteriori is identical with experience. Marks of a priori truths are, according to Kant, absolute rigidity and universality (*Nothwendigkeit und Allgemeinheit*).

Kant has been represented as a philosopher who teaches by his doctrine of the a priori, that man has innate ideas ready in his consciousness. Pure reason, he was supposed to believe, wells up in us as some mysterious power coming from transcendental and most probably supernatural regions. This is absolutely unfounded, as can be learned from the very first sentence in the introduction to his "Critique of Pure Reason":

"That all our knowledge begins with experience there can be no doubt. For how is it possible that the faculty of cognition should be awakened into exercise otherwise than by means of objects which affect our senses, and partly of themselves produce representations, partly rouse our powers of understanding into activity, to compare, to connect, or to separate these, and so to convert the raw material of our sensory impressions into a knowledge of objects, which is called experience? In respect of time, there-

"fore, no knowledge of ours is antecedent to experience, but begins with it."

In order to show that formal knowledge must be distinguished from sensory experience, Kant continues:

"But, though all our knowledge begins with experience, it by no means follows, that all arises out of experience.\* For, on the contrary, it is quite possible that our empirical knowledge is a compound of that which we receive through impressions, and that which the faculty of cognition supplies from itself (sensory impressions giving merely the occasion), an addition which we cannot distinguish from the original element given by sense, till long practice has made us attentive to, and skillful in, separating it. It is, therefore, a question which requires close investigation, and is not to be answered at first sight—whether there exists a knowledge altogether independent of experience, and even of all sensory impressions? Knowledge of this kind is called a priori, in contradistinction to empirical knowledge, which has its sources a posteriori, that is, in experience."

Formal knowledge is independent of sensory experience in so far as we purposely exclude all sensory experience. But, after all, inasmuch as sensory experience is the beginning of all knowledge, a posteriori as well as a priori, to that extent formal knowledge is dependent upon sensory experience (as Kant emphatically declares). Experience is antecedent in time, and from it alone formal knowledge can originate, which—not until a certain height of mental development has been reached—will be separated from the raw material of sensory impressions.

Kant, using the word experience in the limited sense of sensory experience, declares that investigation must go beyond experience in order to find the laws of formal knowledge, or pure thought. He, therefore, called all formal knowledge transcendental, and speaks of transcendental logic, transcendental dialectic, transcendental mathematics, and transcendental arithmetic.

Transcendental is by no means transcendent. Transcendent means unknowable, or what transcends knowledge; transcendental, according to Kant, means what transcends experience. It is not unknowable, but, on the contrary, the basis of all knowledge, and the transcendental sciences treat such subjects as demand (if treated with accuracy) axiomatic certainty. The mysterious has no place in the realms of the transcendental.

The question 'How are synthetical judgments a priori possible?' is to the same purpose as another question of Kant's, propounded in his Prolegomena, § 36, where he asks: "How is nature possible?" When Kant speaks of nature, he refers to our conception of reality, in so far as it is, or can become, the object of science representing the cosmical order of nature. We do not now intend to enter into the details of the problem, as to how far we agree with the sage

\* The word 'experience' is here used in the popular acceptance, being taken as the result of sensory impressions fashioned by pure thought.

\* Here the word is used in the limited sense, as sensory experience.

of Königsberg, and how far we do not agree. But it seems necessary to point out the importance of the problem, on the solution of which the possibility of scientific knowledge depends.

The faculty of thinking in *abstracto* is called reason; and reason (which on earth man alone possesses by virtue of language) can become the basis of science, if by a critical method fallacies and vagaries of reason are prevented. Kant says in the introduction to his "Critique of Pure Reason":

"The critique of reason leads at last, naturally and necessarily, to science; and, on the other hand, the dogmatical use of 'reason without criticism leads to groundless assertions, against which others equally specious can always be set, thus ending un-avoidably in skepticism."

The whole book is devoted to this critique. It shows that pure reason (formal thought) is limited to formal truths only and cannot contain revelations as to the substantial (the sensory or material) contents of our conceptions. This should have been self-evident, but as a matter of fact, philosophers before and even after Kant have most confidently asserted much about God and the world, the human soul, innate ideas, and other things, while their whole reasoning rested upon unwarranted *a priori* arguments. Such philosophers Kant calls dogmatical. Wolf (1679-1754), who had most methodically systematized the metaphysical doctrines of his time, is the most representative dogmatic philosopher.

If we compare our cognition to building material, Kant said, our transcendental knowledge has been employed by dogmatical philosophers for erecting a lofty dome that should reach to Heaven. For this purpose the "Critique of Pure Reason" has found the materials insufficient. Nevertheless, our transcendental cognition is most valuable; certainly it is unfit for the airy castles of supernatural systems; but if employed for its proper purpose, Kant continues, "it very well suffices for a mansion here on earth spacious enough for all our purposes and high enough to enable us to survey the level plain of experience."

Formal cognitions, or conceptions *a priori*, are of themselves "empty;" and sensory impressions of themselves are "blind." If we had only unconnected sensory impressions, we would be worse off than the lowest animalcula or even plants, and the materials of our experience received through our sensory organs would be of no avail. Our formal cognitions furnish the mortar, as it were, of a synthetic method which will enable us to arrange sensory impressions in comprehensively arranged systems. Formal cognition and sensory experience, therefore, are the warp and woof of scientific knowledge. The warp as well as the woof, each by itself, consists of single threads, but in their combination they will furnish a well-woven fabric.

If a philosopher limits his method to sensory experience alone, he will never attain scientific certainty; he can never make definite and positive statements, but will only propose *opinions* which may be overturned on the slightest occasion. Such a one-sided empirical, or naturalistic, philosopher would be guilty of the opposite error of the dogmatist, and while the dogmatist ultimately must arrive at futile assertions, the empiricist's mere opinions must lead directly to skepticism. As the representative philosopher of skepticism, Kant mentions David Hume. David Hume does not recognize the difference between formal knowledge and sensory experience. To him, therefore, all knowledge consists of single, unconnected threads of knowledge.

On the last two pages of Kant's "Critique of Pure Reason," we read the following passages:

"We may divide the methods at present employed in the field 'of enquiry into the naturalistic and the scientific.'"

'Naturalistic' here means what is commonly called "common sense philosophy," which, repudiating all speculation, does not feel the need of a critical method. Kant continues:

"The naturalist of pure reason lays it down as his principle, 'that common reason, without the aid of science—which he calls "sound reason, or common sense"—can give a more satisfactory answer to the most important questions of metaphysics than speculation is able to do. He must maintain, therefore, that we can determine the content and circumference of the moon more certainly by the naked eye than by the aid of mathematical reasoning. But this system is mere misology [contempt of rational thought] reduced to principles; and, what is the most absurd thing in this doctrine, the neglect of all scientific means is paraded as a peculiar method of extending our cognition. As regards those who are naturalists because they know no better, they are certainly not to be blamed. They follow common sense, without parading their ignorance as a method which is to teach us the wonderful secret, how we are to find the truth which lies at the bottom of the well of Democritus."

'Scientistic' denotes here the method of one-sided scientists. The original German text reads *scientifisch*, which has been coined by Kant in opposition to *wissenschaftlich*, i. e. scientific in its usual sense. This scientistic, or one-sided scientific, method lacks critique; it does not distinguish between formal and sensory (between *a priori* and *a posteriori*), and must either undervalue the importance of formal cognition, by not properly employing it as a synthetic principle, or overvalue the importance of formal cognition by attributing to it the power of a supernatural revelation. Kant continues, and concludes his "Critique of Pure Reason" as follows:

"As regards those who wish to pursue a scientistic method, they have now the choice of following either the dogmatical or the skeptical, while they are bound never to desert the systematic mode of procedure. When I mention, in relation to the former, 'the celebrated Wolf, and as regards the latter, David Hume, I may leave, in accordance with my present intention, all others unnamed."

"The critical path alone is still open. If my reader has been kind and patient enough to accompany me on this hitherto untraveled route, he can now judge whether, if he and others will contribute their exertions towards making this narrow foot-path a high-road of thought, that, which many centuries have failed to accomplish, may not be executed before the close of the present—namely, to bring Reason to perfect contentment in regard to that which has always, but without permanent results, occupied her powers and engaged her ardent desire for knowledge."

(To be continued.)

#### METAPHYSICS: THE USE AND MEANING OF THE WORD.

Kant calls every transcendental (or a priori) statement metaphysical, and metaphysics is, in his terminology, the science of pure (or a priori) conceptions. The metaphysics of ethics, for instance, is, so to speak, formal ethics; as may be learned from the editorials in Nos. 51 and 52 of THE OPEN COURT, "Herbert Spencer on the Ethics of Kant." The metaphysics of natural sciences is what Kant calls "pure natural science" (*Reine Naturwissenschaft*). The law of Causation is one of the most important truths of pure natural science. The doctrine of 'Conservation of Matter and Energy,' although it has been discovered through the assistance of experience, can be proved in its full scope by pure reason only. And therefore it would be, according to Kant's terminology, a metaphysical cognition.

Other philosophers have used the word metaphysics in a different sense. Perhaps misguided by a wrong etymology or at any rate under the influence of the literal meaning of the word, they attached to the term the idea of a science that investigates into that which lies behind nature. This unknown something was considered as the source and origin of natural phenomena. Schopenhauer says:

"By metaphysics I understand every pretended cognition which goes beyond experience and therefore beyond nature or the given appearance of things in order to give information about that upon which nature somehow is dependent, popularly expressed what is behind nature and makes nature possible." (Translated from "Welt als Wille und Vorstellung," Vol. II, 2d ed. p. 180.)

The term metaphysics has become popular in the sense conceived by Schopenhauer. No wonder that Comte, from the standpoint of positive philosophy, denounced metaphysics as radically erroneous. Before he was acquainted with Kant's works, he considered him as the representative metaphysical philosopher. Later on when he had read one of Kant's writings, he acknowledged in a letter to a friend,\* that at every

point Kant showed the spirit of positivism. A republication of the letter is found in the preface to Max Müller's translation of Kant's "Critique of Pure Reason."

The name metaphysics is due to a misunderstanding. Aristotle teaches that natural science (*φυσική φιλοσοφία*) must be treated according to certain principles (*ἀρχαί*); therefore it is no independent science. He calls the science of these principles the first, and natural science the second philosophy\* (*πρώτη καὶ δευτέρα φιλοσοφία*). The first science, the philosophy of principles, is treated in a book which in the collection of Aristotelean works had been placed immediately after the books on physics, and some ingenious commentator or copyist, unable to find a proper title, inscribed the essays on the first science *τὰ μετὰ τὰ φυσικά* (sc. βιβλία) "The books after the physical ones." From the words *μετὰ* (after, behind), and *φυσικά* (physical) the term metaphysics has been coined, which gave rise to so many errors and seemed so appropriate and expressive to dualistic philosophers.†

Metaphysics, as employed by Kant, is the most important and most valuable study we have. It is the theoretical basis for all scientific knowledge. Metaphysics, as a science that should give us information about the origin of existence at large, is generally called ontology, or the science of absolute being. Metaphysics, in the sense of ontology, has become, since Kant, untenable ground; and, therefore, Kant has been commended for having given the *coup de grace* to metaphysics.

Goethe and Schiller did not misconstrue the tendency of Kant's criticism, when they declared in one of their Xenions:

"Since Metaphysics of late without heirs to its fathers is gathered,  
Here at the auctioneer's are 'things of themselves' to be sold."

Metaphysics, in the sense of first principles, would be a clarification of our most general ideas, which, like

rapproché de la philosophie positive... Pour moi je me trouve jusqu'à présent, après cette lecture, d'autre valeur, que celle d'avoir systématiquement arrêté la conception ébauchée par Kant à mon insu, ce que je dois surtout à l'éducation scientifique; et même le pas le plus positif et le plus distinct que j'ai fait après lui, me semble seulement d'avoir découvert la loi du passage des idées humbles par les trois états théologique, métaphysique, et scientifique, loi qui me semble être la base du travail dont Kant a conseillé l'abandon. Je rends grâce aujourd'hui à mon défaut d'éducation; car si mon travail, tel qu'il est maintenant, avait été précédé chez moi par l'étude du traité de Kant, il aurait à mes propres yeux beaucoup perdu de sa valeur. Auguste Comte par E. Littré. Paris, 1864, p. 154. Lettre de Comte à M. d'Eichthal, 10 Déc. 1821.

We must add, that to our conception Comte was more metaphysical even than Kant, for he still believed in the Unknowability of what he called "first and final causes," and considered only "the middle between them" accessible to cognition. His conception of positivism was to limit science to the positively knowable; but he did not succeed in entirely freeing his philosophy from mysticism.

\* *Ἡ μὲν ἀνὴρ ἡμεῖς τις ἐτέρα οὐσία παρὰ τὰς φύσεις συνεστηκυῖα, ἣ φυσικὴ ὡς εἰς πρώτην ἐπιστήμην· εἰ δὲ τὴν τῆς οὐσίας ἀκίνητος, αὕτη πρώτη καὶ φιλοσοφία πρώτη.*—Arist. Metaph. v. 1.

† Titulum vulgatum τὰ μετὰ τὰ φυσικά non ab ipso esse Aristotele his libris inscriptum, adeo est verisimile ut pro certo haberi possit. Reintz, ad Arist. Metaph. p. 3.

\* J'ai lu et relu avec un plaisir infini le petit traité de Kant (*Ideen zu einer allgemeinen Geschichte in weltbürgerlicher Absicht*, 1784); il est prodigieux pour l'époque, et même, si je l'avais connu six ou sept ans plus tôt, il m'aurait épargné de la peine. Je suis charmé que vous l'avez traduit, il peut très-utilement contribuer à préparer les esprits à la philosophie positive. La conception générale ou moins la méthode y est encore métaphysique, mais les détails montrent à chaque instant l'esprit positif. J'avais toujours regardé Kant non-seulement comme une très-fortifiée, mais comme le métaphysicien le plus

logical theorems, are most obvious truths. Schiller occasionally jests about the subject, saying in one place:

"Metaphysicians know, I'm told,  
That what is hot cannot be cold;  
Light is not dark, they'd bet,  
And dry things are not wet."

A statement will contain the less positive knowledge, the more it is generalized. The most general laws, which imply absolute universality, are merely formal and do not contain any positive knowledge, however important they may be for the purpose of orientation, so as to enable us to locate and map out our different cognitions according to a systematic method; and those philosophers who assume an air of profound wisdom when speaking about metaphysics are satirized by Schiller in the following lines:

"How deep the world beneath me lies;  
My craft the loftiest of all  
Lifts me so high, so near the skies  
I scarce discern the people crawl."  
Thus shouts Jean Roofer from his spire,  
Thus in his study speaks with weight  
Metaphysicus, the learned sire,  
That little man, so high, so great.  
That spire, my friend, proud and profound,  
Of what is 't built; and on what ground?  
How came you up? What more is 't worth,  
Than to look down upon the earth?

Mephistopheles, in Goethe's *Faust*, treats the subject in a well-known passage with great sarcasm. He satirizes those metaphysicians who are pleased to veil their language in mystical and contradictory expressions, which either contain trite truisms in the shape of philosophical conundrums, or must be classed with hallucinations and other pathological phenomena of a diseased brain. Mephistopheles says:

"The next most important thing to mention,  
Metaphysics will claim your attention!  
There see that you can clearly explain  
What fits not into the human brain:  
For that which will not go into the head,  
A pompous word will stand you in stead."

—Translated by Brooks.

Metaphysics, in the sense conceived by Schopenhauer, and combated by Comte, is the last remnant of theological supernaturalism. It is dualism, pure and complete, without religious mythology. The mythological entities have been volatilized in the crucible of philosophy to vague shadows of a transcendent or metaphysical something. This something is supposed to be "the thing of itself," the ultimate  $x$  in all philosophical problems, and the unknowable, eternal reality behind the knowable transient phenomena. Metaphysics of this kind has been and will more and more be superseded by Positivism; it is irreconcilable to monism, which is positive and anti-metaphysical.

#### REVIEWS.

*Current Literature*, the new monthly, is published in New York. An eclectic magazine of stately size, and including a copious variety of happy selections from current publications, newspapers, and magazines. Most of the articles are grouped together under appropriate headings, so as to constitute departments. A

whole library of instructive matter is presented in each number, and the reader's attention is called to many a useful and interesting article published in journals which he may rarely have a chance to meet with.

*Table Talk*, a monthly magazine, devoted to the needs of American households, will be welcome to the intelligent housewife of every home. Its contents are not entirely given to the *pratique* of household economy. The poetry and ethics of the culinary world also find their proper representation in *Table Talk's* pages. What a mass of sentiment clings to the bare thought of a "Thanksgiving Dinner," even when the discussion is limited to the cold recital of a *menu*! What a mountain of hope and ambition rises in one, when he reads "How to Live on a Thousand a Year"! We cheerfully recommend *Table Talk* to all who, in cultivating the *sana mens*, have deputed to their wives the care of the *sanum corpus*. *Table Talk Publishing Company*, Philadelphia, Pa.

The *Art Amateur* for November gives us its programme for the new year, which we know is coming, although the beautiful Indian Summer seems rather to carry us back to July than to give a hint of bleak December and January. It promises many good things. Colored prints in each number, Decorative Designs, and Flower Studies will be among the illustrations, while "The House" will contain drawings of interiors and designs for furniture. Amateur Photography, and Ecclesiastical Embroidery will receive due attention, and Photo Gravure, Etching and China Painting will not be neglected. The most interesting reading matter will probably be the biographies of artists, both of the American and foreign schools.

The present number contains a sketch of unusual interest of a Russian painter, Vassili Vereschagin, a philosopher of Tolstoi's manner of thought. He has endeavored to paint the horrors of war, with such realistic force as to turn men's minds to love of peace rather than of military glory. He has also painted many Scripture scenes with such fidelity to what he conceives to have been the actual facts in the case, as to shock those who have always thought of them as supernatural occurrences. For instance, "The Resurrection" shows Jesus thrusting his head out of the narrow opening of an ancient Jewish tomb, while the Roman guards frightened by the apparition are running away. He made studies for these pictures in Palestine, and in simple reverence has tried to reproduce the picture of these events just as they occurred. He believes in his method and thinks time will justify him. He is now on a visit to this country, and is said to be a genial man, with a hearty laugh, and to speak English well. There is an interesting notice of the collection of pictures by George H. Boughton, and many other articles of interest.

The *Art Amateur* is a very welcome visitor among young students, and those who are now planning for Christmas gifts might well consider how pleasantly they would be remembered throughout the year by a subscription for this popular journal. E. D. C.

#### NOTES.

The Freidenker Almanach for the year 1889 contains valuable contributions from prominent German-American authors.

M. Alfred Binet has recently given to the public a collection of essays entitled, *Studies in Experimental Psychology* (Octave Doin, Paris). He has added some interesting remarks upon the Problem of Hypnotism, which may be regarded as supplementary notes to his work upon *Animal Magnetism* in the "International Scientific Series."

Omitted Chapters of History Disclosed in the Life and Papers of Edmund Raschke, by Moncure D. Conway (G. P. Putnam's Sons), is now before the public. The work contains a wealth of interesting historical material, and consists chiefly of unpublished matter. THE OPEN COURT, Nos. 52 and 53, contained an inter-

interesting article by the author, upon "The Founding of Our Religious Freedom," also taken from unpublished sources.

Moncure D. Conway's essay "The Spiritualists' Confession," in No. 63 of THE OPEN COURT, deserves a careful perusal. The success of the spiritualists must be attributed to the natural longing of mankind to know something positive about immortality. The old view of a continuance after death in the Utopia of a supernatural world has become untenable. Nevertheless, the idea of immortality contains an important truth which should be better understood in order to be fully appreciated.

### MY THREE FRIENDS.

BY CARMEN SYLVA. (ELIZABETH, QUEEN OF ROUMANIA.)

TRANSLATED FROM THE GERMAN BY MARY MORGAN (GOWAN LEA).

Together lived we on the Rhine  
(The Wood, Myself, and Songs of mine),  
Companions were we three:  
And what we thought, or sung, or dreamed,  
We whispered, while the moonlight gleamed,  
Low to the silvery sea.

But Fate called me to leave the spot,  
In foreign lands to build my cot;  
The East my home must be:  
"Alas, good friends, what can we do?"  
That we should part I sorely rue;  
Oh, come along with me!"

They shook their heads, both Rhine and Wood:  
"In old age wandering is not good;  
But we shall hold thee dear."  
No sooner my new home I found,  
Than from its portal came a sound—  
My Songs! Hark—they are here!

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXV.—Continued.

After carelessly scanning the list of names in the visitors' book, the Sovereign despatched the curator upon an errand and began, to his attendant: "The collection is less seen than it deserves; I have long thought of having it made better known and more useful to men of learning, by a better arrangement and a good catalogue. It has been one of the little pleasures of my life; I have learnt much by it, and it has at times banished annoyances from my mind. Do you know of any one who would be fitted to undertake the management of a work so important and exacting?"

The Chamberlain bethought himself, but no one occurred to him.

"I should prefer a stranger," continued the Sovereign. "That will give rise to a passing and unembarrassed connection. He must of course be learned and have good guarantees of character."

The Chamberlain named several connoisseurs from other capitals. The Sovereign looked at him keenly, and shook his head. "Think it over," he repeated; "perhaps some one will occur to you."

Translation copyrighted.

The examination continued. An antique vase interested the Sovereign by reminding him of how he had obtained it. A Roman woman, of great beauty and commanding figure, had suddenly confronted him and offered it to him with such a distinguished manner, that he, as he laughingly expressed it, was so surprised by the unusual demeanor of the woman, and her sonorous voice, that he paid her more than she asked.

No one yet occurred to the Chamberlain.

On his way back to his apartments the Sovereign remained standing in one of the spacious but lonely halls and asked the Chamberlain, "Has it not occurred to you that Scarletti dresses badly?"

The Chamberlain dissented, for the actress mentioned was supposed to be in favor.

"Yesterday evening she carried an immense bouquet. To which of our young men is this ungraceful attention to be ascribed?"

Again the Chamberlain was astounded.

"As you are disposed to know nothing to-day," continued the Sovereign, in a sharp tone, "I must tell you that I should be sorry to see the Hereditary Prince having any intercourse whatever with the ladies of the theatre. He is not old enough to carry on such connections with the necessary reserve; and the vanity of these ladies will bring every favor to public notice."

The Chamberlain affirmed, upon his honor, that he knew nothing of these civilities of the Hereditary Prince, and that, even if the assumption of his gracious master was well founded, it could only have been a passing idea of the Prince that had occasioned this gift. "Your Highness will be convinced that I would not lend a hand to anything of this kind."

"But I do not choose that you should close your eyes to it," continued the Sovereign, bitterly; "you stood in the box behind the Hereditary Prince, and you must have seen the coquettish look of admiration which she cast upon him. The present was probably sent by the new valet; let him know that in my service one does not carry two faces under one hood. But I require of you," he continued, more calmly, "that you should redouble your vigilance. What occupies him now?"

"He attends regularly the small evening parties of the Princess."

"And in the day?" added the Sovereign, continuing the examination.

"As your Highness knows, he is fond of music; he plays duets with the music-master."

"What does he read?"

The Chamberlain named some French books. "May I be allowed humbly to make a proposal? It would, in every point of view, be useful to his Highness if he had the pleasure of devising or arranging

something—perhaps the laying out of a park, or the management of a farm. I venture to suggest that a similar occupation has been found advantageous to young princes at other courts. Perhaps one of your Highness's castles could be adapted for such a purpose."

"And the Hereditary Prince and Mr. von Weidegg would keep their own court, and remain many months in the year far from ours, at their villa," replied the Sovereign.

"I assure your Highness that I never thought of such a thing," answered the Chamberlain, offended.

"I do not blame you," replied the Sovereign, with cutting courtesy. "Consideration for my coffers forbids my assenting to your proposal; but I shall think of it. It is a disappointment to me that the Prince has not learned to take an interest in anything during his stay at the University. Has he had no personal relations during that time that may have given some zest to his life?"

"He took great pleasure in the circle of Professor Werner," replied the good Chamberlain, hesitatingly.

"I hope he preserves a grateful recollection of his teacher."

"He speaks with great interest of him and his family," rejoined the Chamberlain.

"It is well," concluded the Sovereign. "I will take into consideration the question of agricultural occupation; and do not forget to think a little concerning my collection."

This new demand could no longer be withstood by the Chamberlain; he was silent for some minutes, inwardly struggling, while the Sovereign moved on with his head turned towards him, like one who waits for something decisive.

"I do not know that I can propose any one better for the purpose than Professor Werner himself," said the Chamberlain, at last.

The Sovereign again stopped. "You consider him fitted for the work?"

"With respect to his scientific capabilities I naturally can form no judgment," replied the Chamberlain, cautiously.

Irritated by this cowardly attempt to draw back, the Sovereign asked with emphasis, "Would he undertake such a charge?"

"He has a very distinguished position at the University, and is happily married; and he would, undoubtedly, not like to leave his present position for any length of time."

"Perhaps that may be arranged," rejoined the Sovereign. "Werner, then, is the man. At a short interview I accidentally had with him he made a good impression on me. Do not forget to remind me this

evening that the archives at Bielstein are to be searched."

Thus did a father exert himself for the benefit of his son.

The Chamberlain reminded his lord that evening that there had been a question of an investigation in the archives of Bielstein, and the sovereign thanked him for it. The following morning orders were given through the Council to the keepers of the records and members of other branches of the Court and State administration, to seek out and send all records of a certain age that had reference to the castle of Bielstein and monastery of Rossau. This order occasioned a great raising of dust, and five large leather sacks were filled with records and old papers. The collection was sent to the Professor; and in a letter the Sovereign expressed his thanks for the attentions which the Professor had shown the Hereditary Prince. He added that, remembering a former conversation, he sent for his inspection all that, in a cursory search, could be found concerning a place in which he took an interest.

This letter gave cause for serious consideration to two inquiring minds. When the dubious report of the student concerning an existing chest had disturbed the peace of the house, the friends had again turned their attention to the inventory of the deceased Bachhuber, and had once more pondered over every word of it: "In a hollow and dry place, *LOCO CAVO ET SICCO*." The word place, *locus*, occasioned much thought; but they could come to no certainty about it. "Of the house of Bielstein, *DOMUS BIELSTEYN!*"—here the expression house, *domus*, was very remarkable. Did it mean that the manuscript lay concealed in the dwelling house itself, or was the word house used in the obsolete meaning of estate or property? The Doctor contended for the dwelling-house, the Professor for the estate. Much depended upon this; for if *domus* signified estate, the manuscript might be concealed in any part of the property. "I have deposited it all, *hec omnia deposui*." The word all, *omnia*, was very comforting; for it gave the certainty that the deceased Bachhuber had not left the manuscript behind. But the depositing was a matter of some doubt. Did the word betoken that the manuscript was deposited only in Bielstein, and thus given over and entrusted, so to speak, to the inhabitants?—or had the writer chosen the expression because he wished to signify the interring and blocking it up in some deep place? To us laymen in the Latin tongue, it appears clear indeed that Bachhuber was very glad to have a Latin vocabulary in which to signify the concealment of his treasure; however, the feeling of the learned men was otherwise.

Finally, the friends agreed in taking the view, that, in spite of this account, the walls of the house were worthy of future attention. The hollow places which

the Doctor had registered might be examined; the cupboard in the wall in Ilse's bedroom appeared a place not to be despised. The Professor, therefore, determined to obtain some certainty on that point during the next vacation. The business of the Rector had only allowed a short visit to the castle this time; but the Professor would be aided by his position in the family, which opened Ilse's room and cupboard to him.

It was a fine August day; the father was riding about in his fields, and Ilse sitting with Clara in household consultation, when an uproar was raised in the kitchen, and the housekeeper, quite beside herself, rushed into the sitting-room, exclaiming: "There are ghosts around again!" There was, in fact, a loud knocking in the house, and the maids congregated in the hall. The noise came from the upper story; so Ilse hastened upstairs, and, on opening the door to her room, found the Professor, in his shirt sleeves, working in the cupboard with various tools he had obtained from the carpenter. He received her, laughing, and called out, to tranquilize her, that he was nailing the cupboard boards tighter. This was right, but he had first broken through them. The manuscript was not there, and nothing was to be seen but an empty space and a few bits of mortar. There was, however, one inexplicable thing, which might be a trace of the manuscript—a small bit of blue cloth rag; how that had come into the wall was a riddle. On further examination, it appeared that it was not colored with indigo; therefore, probably, it had existed previous to the introduction of that color into civilization. Whether a mouse, in her motherly care, had deposited it there as an ornament to her bed, and at the same time for food in a desperate case of necessity, could not be ascertained, as at present these folk seem to have no traditions of the past, and the individual had probably been eaten some centuries ago by an ancestor of one of our cats.

This discovery might have given confidence to the friends, for there were now two places where the treasure was not. But there is much that is illogical in the nature of men. Even the Doctor inclined now to the Professor's opinion, that the manuscript was perhaps not concealed in the house; nay, that it might even be at a distance from the place.

Such was the state of the matter when the Sovereign's packet arrived. The friends were occupied many hours with the trunks, and examined the records carefully. They found much that would be valuable for the history of the district, but nothing that led to the manuscript. At last, the Professor raised from the bottom of one of the trunks a thick bundle of reports, on sheets sewed together, which had been sent by the officials of Bielstein to the Government. Among them

was the writing of a deputy-bailiff of the last century, in which he notified that he was hastening, in those times of suspense and danger, commanded by high authority, to convey to the royal country residence, Solitude, the chestful of hunting implements and old books which had up to that time been in his custody.

The writer of the letter had undoubtedly not foreseen what an excitement his faded scroll would produce in a later generation.

"This is the student's chest," cried the Professor, the color rising to his cheeks, while he held out the document to his friend.

"Remarkable!" said the Doctor. "It is impossible that this coincidence can be accidental."

"The student's chest was no will o' the wisp," cried the Professor to his wife, in her room; "here is the confirmation."

"Where is the chest?" inquired Ilse, skeptically.

"That is just what we do not know," replied the Professor, laughing. "Here is a new scent, indistinct, and in a new direction; but it may lead shortly to the vanished parchment." The friends hastened back eagerly to the bundle of records. "Old books!" exclaimed the Doctor; "the house was a hunting castle; a generation before this letter was written, the estate came first into the possession of this princely family; it is not probable that they themselves, in their short hunting visits, should have collected books there."

"Old books!" exclaimed also the Professor; "it is possible that hunting journals and accounts may be meant; but it is not impossible that the chest may also contain some few things of the property of the monastery. Ilse, where is the old castle belonging to your Sovereign called Solitude?"

Ilse knew nothing of such a castle.

"It is a fortunate coincidence that the Sovereign himself may give us an opportunity of obtaining more accurate information."

"Ah, you poor men!" said Ilse, through the door, pityingly. "Now you are far worse than before; as long as the treasure was still supposed to be in our house, my father at least could keep a good look out; but now, it is in a chest far away in the wide world, and no one knows anything even of the house to which it may have been carried."

The friends laughed again. "Your father's house is not on that account less under suspicion," said her husband, consolingly.

The Professor sent back the contents of the chest to the Royal Council, expressed in his letter his warm thanks to the Sovereign, and mentioned that an uncertain trace made him very desirous of obtaining permission to make personal investigations.

The letter had the desired result for both parties. The Sovereign had the satisfaction, which is pleasing

to earthly masters, of appearing to confer a favor while he was seeking one.

The Professor was joyfully surprised when he received from the Council in the name of the Sovereign a letter promising to promote his investigations in every way, and making the following proposal: The Sovereign wished his cabinet of antiquities to be examined by a scientific authority, and there was no one to whom he would more willingly trust this task than to the Professor. He knew well how valuable to others was the work of so learned a man, but he hoped that his collection might appear of sufficient importance to him to spend a few weeks upon it.

At the same time the Chamberlain wrote, by desire of his gracious master, that the Sovereign would be delighted if the Professor would accept the hospitality of the Palace during the time of his stay. A garden pavilion, which was a pleasant spring-residence, would be at his disposition. The dwelling was large enough to receive his family also, and he was commanded to suggest that there would be plenty of room if the Professor would bring his wife and servants, as the Sovereign did not wish that the learned man should be deprived of his domestic comforts during his stay. The beginning of the spring would be the best time for both parties; and the Chamberlain would be delighted to do the honors of the capital to his countrywoman.

The Professor hastened with flying steps to his wife, and laid the letter in her lap. "Here, read what endangers our journey into foreign lands. It will engross the greatest part of our traveling time. But I must accept the invitation; for any prospect, even the most distant, of obtaining the manuscript compels me to stake much that a man will only sacrifice for a great hope. Will you accompany me on this chase? You see, the kind people have thought of everything."

"I a guest of our Sovereign!" exclaimed Ilse, reading the letter. "Never should I have dreamt of such an honor. What will my father say of it! It is a very honorable invitation for you," she continued, seriously; "and you must at all events accept it. As for me, I think it may be best for me to remain here."

"Why should we be separated for weeks?—it would be the first time."

"Send me to my father meanwhile."

"Does not that come to the same thing?" asked the Professor.

"What shall I do among these strangers?" continued Ilse, anxiously.

"Nonserse," replied the Professor. "Have you any reason to give?" and he looked at her, discomposed.

"I cannot say that I have," replied Ilse.

"Then decide at once, and come. We should probably feel more free if we could live as we liked; but I

should not wish to reside for weeks at a hotel in a foreign city; and, from another point of view, this reception will save both parties the difficulty of offering and refusing compensation. We shall remain there as long as is indispensably necessary; then we shall go south, as far as we can. It is, after all, only putting off the journey a few weeks."

When the Professor's letter of acceptance arrived, the Chamberlain informed the Sovereign of it in presence of the Marshal: "See to it that the pavilion is arranged as comfortably as possible. Dinner will be served at the pavilion at whatever hour the Professor wishes."

"And what position does your Highness intend the strangers shall occupy at Court?" inquired the Marshal.

"That is understood," said the Sovereign; he has the privilege of a stranger, and will occasionally be invited to small dinners."

"But the Professor's wife?" asked the Marshal.

"Ah!" said the Sovereign, "the wife. It is true, she comes with him."

"Then," continued the Marshal, "there is to be dinner for two at the pavilion; apartments for two, and a room for a lackey without livery."

"That is enough," said the Sovereign; "for the rest, we shall see. If the Professor's wife visits our ladies, I assume they will return the civility. We will leave the rest to the Princess."

"What is the history of these strangers?" asked the Marshal of the Chamberlain. "You know the people."

"As one knows people in a strange city," replied the Chamberlain.

"But you arranged their coming?"

"I only wrote according to the Sovereign's orders. The Professor is a learned man of reputation, and a thorough gentleman."

"But what has his wife to do here."

The Chamberlain shrugged his shoulders. "He could not be got without his wife," he replied, cautiously.

"Yet the Sovereign made a point of her coming."

"Did that strike you?" asked the Chamberlain. "I, for my part, did not remark it. He made it appear as if it were a matter of indifference to him; and, furthermore, she is a country-woman of his."

"You know that the Sovereign would be the last to infringe the rules of the Court. There is no reason for anxiety."

"At all events, the Princess must maintain her position. I hear this Professor's wife is considered a beauty?"

"I believe she is also a woman of high character," replied the Chamberlain.

(To be continued.)

## FORMER CONTRIBUTIONS TO "THE OPEN COURT."

MORRISON I. SWIFT.

In No. 23 Morrison I. Swift makes a vigorous appeal to the churches that they become actively interested in what is generally known as "The Social Problem," and that they take the lead in Christianizing the people after the manner practiced by Jesus in Judea and by his disciples, as related in the New Testament. Mr. Swift's language is clear, eloquent, pervaded by an ideal humanitarianism, and is not only respectful to the clergy but even reverent. He thinks the opportunities of the present and the future are in the hands of the churches, and that the clergy may lead the van of social progress instead of trailing along behind the baggage wagons, as they have so long been contented to do. "In this country," he says, "where the church has the allegiance of so large a portion of the people, where it represents a large proportion of the specially organized moral forces of the land, where finally its material resources are almost unlimited and the money power of the country is its friend and supporter, it would be possible for the church to bring about the reform that is needed, with little difficulty, if it desired to do so." Here Mr. Swift is confronted with the important objection that should the church take the lead in the social revolution or even in social reformation so far as "to establish such fair distribution of the products of human industry that superabundance and luxury will not exist," the "money power of the country" would cease to be its "friend and supporter" and the clergy might cease to be a priesthood. He presents the difficulty thus: "It is said by some that the pulpit will not go much beyond those who maintain it. This is to acknowledge that the opinions of the clergy are to-day bought and paid for, just as lawyers are hired and legislators sent to uphold the ideas of their constituency." Notwithstanding this difficulty, Mr. Swift sees "a slumbering lion in the Christian ministry, which will, ere long, awaken and put forth its formidable powers for the poor and the oppressed."

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. I, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. *Katzenjammer* is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to *Katzenjammer*. *Katzenjammer* was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a *Katzenjammer*'s-band was that of Cataline! What *Katzenjammer* was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express—to speak."

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophic theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are *determined* by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbott. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.  
Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.  
Christian Propagandism. By Francis Ellingwood Abbott. Price, 10 cents.  
God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.  
Compulsory Education. By Francis Ellingwood Abbott. Price, 5 cents.  
The Present Heaven. By O. B. Frothingham. Price, 5 cents.  
On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.  
A Study of Religion. By Francis Ellingwood Abbott. Price, 10 cents.  
The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbott. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.  
Giordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.  
The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbott. 100 pages. Price, 10 cents.

Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourn and Prof. Asa Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. Jones. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts. 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 204 pages. Price, 10 cents.

Social Ideals. By David A. Wasson. Price, 10 cents.

The Decay of the Christian Church: its Causes and Remedy, by Rev. J. C. F. Grambsie. Price, 15 cents.

Natural Religion. By James Vila Blake. Price, 5 cents.

The Family Purse. By James Vila Blake. Price, 2 cents.

The Philosophy of a Strike. By N. A. Dunning. Price, 5 cents.

Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to one address on receipt of one dollar; separate pamphlets mailed on receipt of price.

## Recent Contributions to 'The Open Court.'

THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET In Nos. 49, 50, 51, 55, 56, 57 and 58.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a varied wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Féré, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own.—The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## A MARRIAGE ADDRESS.

BY WM. M. SALTER.

In the eyes of the law you are now husband and wife. But there is a wider view of the matter. Marriage is a union of hearts and minds. It has an ideal significance. It is an introduction to a newer and higher life. It is not inapt then that a few words be addressed to you on these broader and deeper aspects of the relation on which you are now entering.

Marriage, to those who take the modern view of the world, is still a sacrament. It is a sacred thing. It cannot be entered on lightly. It cannot be made to serve low purposes.

"Love's not love,  
When it is mingled with regards that stand  
Aloof from the entire point."

Marriage that springs not from love is an anomaly and often draws after it a bitter curse. It is love that gives it its sacredness. No hand of priest or minister, no mystic rite can atone for the lack of this, and the most venerated forms can do no more than set it forth and declare it with becoming solemnity and impressiveness.

The love that finds its fruition in marriage is not of the body only, nor is it for a day; it is of the entire being, and in anticipation it covers the entire life. Such love is the high tide of the soul; experiencing it, men and women are twice themselves; reason, imagination, and even the senses, seem gifted with new powers.

The grandeur of our nature is that from our best moments we can take the rule for our poorest and worst. Marriage involves not merely a state of feeling, but also a state of will. The love of which I speak is after all a choice. It finds its utterance in a vow. The old Latin word *sacramentum* meant an oath. It was often applied to the pledge of loyalty to one's country, which a soldier took. A sacrament is that in which we bind ourselves over to something. So, in this act of marriage, my friends, you bind yourselves over to one another. You take your best thoughts now, your purest feelings, and you say to yourselves, these we will make the rule and the law for all our lives. You will act always in love, you will seek always one another's good, you will—to quote a beautiful passage of Christian Scripture—"in honor prefer one another," you will—to quote still another—"never let the sun go

down on your wrath," but be kind and tender-hearted, and always ready to forgive one another.

These finest and highest feelings I know are in your hearts now, and you are inwardly saying to yourselves, —yes, we will be true to them, and *be* what in our dreams we want to be. Make these ardent resolutions, vow that through life you will be true to one another, that you will love and honor, comfort and keep one another, in sickness and in health, in prosperity and in adversity; and these moments will live in your memory as a holy time to you, and the remembrance of them will make you strong, should temptations ever assail you, will make you brave in trial, will keep you faithful and serene should your feelings ever ebb a little instead of keeping at full tide.

Marriage is a partnership in all sweet affections. It is a partnership in virtue; it is also a partnership (or should be) in the things of the mind, the things that pertain to an advancing civilization. A wife is no longer a slave, nor is her husband a lord whom she must obey. She is a companion, she is to be the partner of his thoughts, of his aims in life, and to share in his ambitions. How sweet is such comradeship for a man, and how it enlarges the soul of a woman.

Men and women are not alike, nor have they the same duties; but they should sympathize with one another, and understand one another. They need one another; they are complementary to one another, and each without the other is imperfect.

"For woman is not undeveloped man  
But diverse; could we make her as the man,  
Sweet love were slain: his dearest bond is this,  
Not like to like; but like in difference:  
Yet in the long years liker they must grow;  
The man be more of woman, she of man;  
He gain in sweetness and in moral height,  
Nor lose the wrestling thews that throw the world;  
She mental breadth, nor fail in childward care,  
Nor lose the childlike in the larger mind;  
Till at the last she set herself to man,  
Like perfect music unto noble words;  
And so these twain, upon the skirts of time,  
Sit side by side, full-summ'd in all their powers,  
Dispersing harvest, sowing the To-be,  
Self-reverent each, and reverencing each,  
Distinct in individualities,  
But like each other even as those who love:  
Then comes the stater Eden back to men:  
Then reign the world's great brides, chaste and calm,  
Then springs the crowning race of humankind."

The highest duty and the proudest right which man or woman can have is to work for the progressive civilization of mankind. The aim of our lives is not

altogether in ourselves. We are parts of a greater whole. We belong to humanity. We cannot help thinking of a more perfect humanity that will some day be, and as the rivers flow onward to the sea, so do our souls move in longing and desire toward the future triumph of the good.

The significance of marriage is at bottom moral; by it we are taken out of ourselves and linked to another; we learn unselfishness, we learn that our true life is not in ourselves, but in union with another.

Morality in its widest sense, I might call our marriage with humanity,—so that the centre of our being is no longer in these poor, partial, and so swiftly vanishing selves, but in that grander life of which we are a part, which was before we were and will continue to be after we are gone. The marriage of two souls inevitably suggests the union of each to the good of all. The one should lead to the other. The love which has made your hearts tender to one another, though in one sense it is peculiar to yourselves and always must be, should yet make you tenderer to all the sons and daughters of men. Do not retreat within yourselves, do not turn love into a new though slightly larger selfishness. From its hidden spring let come a stream to enrich the world, let it give you the impulse and the courage to dare and do for the true and the right as never before.

You join hands now, join them in fealty to one another, to love and serve one another while you live; join them also, I pray you, in a still grander vow—to give yourselves to the true love and service of humanity.

We all of us who are here, bless you, and from our hearts wish you joy.

#### THE MARRIAGE PROBLEM.

BY E. D. COPE, PH. D.

(Concluded.)

#### III.—MODIFICATIONS OF THE PRESENT MARRIAGE SYSTEMS.

I have treated the subject of this paper in what might seem to some readers to be a utilitarian spirit, and I have done so intentionally. I have desired to get at the basis of fact on which some of the strongest of the emotions of the human mind repose, so as to be able to avoid, if possible, prejudice or bias. The subject is not usually treated of in cold blood, so to speak, just as one does not ordinarily handle deliberately, and closely inspect, a burning object. However, I hope to be able to maintain the judicial attitude towards the subject of the present section of this paper, and I beg that my readers will do the same. I hope to avoid the unreasoning denunciation of imaginary evils, and laudation of supposititious good, which is the material of current discussion of the subject.

It has been already remarked that of the four possible systems of intersexual relation, those of heterogamy and polyandry are either destructive of the best interests of society, or are, for material reasons, impracticable. It remains to consider the two remaining ones, polygamy and monogamy; by polygamy, voluntary polygamy being meant. It does not seem difficult to the present writer to show that of these two systems a good or successful monogamy is the better for both sexes. Where the sex-interest between a man and a woman is sufficiently strong, both of them will make its preservation a matter, of especial effort, and if the various wants of the character of the one are met by the other, there is no room for any third or fourth person. This state of affairs will, however, not be general in an imperfect condition of civilization of manners and mind, so that monogamy must be, in point of fact, a more or less imperfect arrangement. The reasons why monogamic marriage is so often a failure, are as numerous as are the faults of human character, but one of the most common is one which might be avoided. This is the existence of a pessimism on the subject, and an ignorance of how much happiness may be developed, so to speak, by the mere attempt to produce it. Nature has given us the initiative, and there is no reason but human perversity, why we should not take a hint from her pointings, and go beyond her into the regions of mind, where light and life are, and where Nature herself is transfigured by the atmosphere through which we view her. But how many persons fail to rise, or having risen, to remain, in this region of the exaltation of true love, but throw away in the most reckless manner a jewel which they may never recover. It seems extremely probable that if this subject could be properly understood, and become, in the details of its practical conduct, a part of a written social science, that the monogamic marriage might attain a far more general success than is often found in actual life. But, far be it from me to admit the idea, that it is not now, in many instances, the most perfect of human relations.

Since as much suffering is caused by ignorance as by wickedness, a great deal of the waste of happiness in marriage life is due to an ignorance of the possibilities of the situation. The woman often does not reflect that there is nothing but his affection to bind her husband to her, until her own unkindness has driven him away. The unsuspected result comes on her like a lightning-stroke, and she may have much time for regrets. The man does not know the possibilities of love that lie in the heart of his wife until she gives him some evidence that shames him into respect for her, or until she is lost to him through his ill treatment. And from these extreme conditions to matters of lesser import.

"Man schafft so gern sich Sorg' und Müh',  
Man sucht die Dorn'a und findet sie."

and suffers, where a little knowledge, a little benevolence, or a little physic, would clear the sky and let in perpetual sunshine.

That there are serious divergencies of character and conduct in men and women which render them unfitted for the partnership of marriage, follows from their various ancestry and education. There are men whose personal habits and manners render them unfit for the society of any but a woman of their own low type. There are women who are possessed of a hysteria of an aggressive character, who constantly tempt the man to put his superior muscular force into practical operation. Then there are persons of both sexes who have injurious habits, and others who are more or less insane. Insane persons and habitual drunkards, opium eaters, etc., should not, in the writer's opinion be permitted to marry, or if married, should be separated from their husbands or wives. This is for the all-sufficient reason that such unions cause a great deterioration of the race. Of the reforms necessary in our marriage laws, this one is the first to which I wish to call attention. But the suffering and loss arising from ill-assorted marriages are not confined to the lower or abnormal types of men, but extend to the highest. In fact it is probable that the mental suffering is greatest among the most highly organized of mankind, where emotional sensibility is most active, and intellectual life more real and important to its possessor. The experience of the intellectual man or woman is illustrated by the case mentioned by P. G. Hamerton. The man relates that after marriage he found his wife to be totally ignorant. He attempted to teach her; she became angry at this, and he gave it up, and with it the hope of companionship for a life time. The position of woman in an ill assorted marriage is even more unfortunate than that of man, on account of her fewer opportunities for relief; and on account of the still greater grievance of the physical impress she receives in the case that she bears children.

That there should be a large percentage of unsuccessful marriages, as marriages are made, is to be expected. The principal element in determining the result so far as we can see, is contiguity; often with small opportunity of real acquaintance. The most disastrous mésalliances are often made through the sheer incapacity of a noble boy or girl to imagine the worthlessness or depravity of the characters with whom he or she is brought into contact; and the most unsuspecting natures are the most easily deceived. All this is well worn ground, and I now turn to possible remedies.

It has been proposed that all laws governing the

marriage relation be abolished, and arrangements be made by the two persons interested, to suit their own convenience and pleasure. It has been objected to this proposition that it involves the introduction of a reign of confusion, and in fact the adoption of a kind of heterogamy. Partners, it is alleged, would be continually changing, and children would not know their parents, nor parents their children. Such critics mistake a great deal of human nature. The union of a man and a woman in the social relation is not the creature of law, but the laws are its creature. A man and woman who can live happily together in their natural relation, are not easily separated. There are innumerable instances where couples live together without any bond but their own consent. The bond created by children is also a strong one and is not readily broken. The woman is especially tenacious for various reasons. Her more affectionate nature, her anxiety for her children, her comparative dependence, all render her more willing to suffer some ill than to fly to possibly greater ones that she knows not of. And this nature meets with its response in many men. Under a free system many improper associations could be broken up, and good ones could be formed. But on the other hand full scope would be given to both the attractions and repulsions of the moment, to which some persons of both sexes are subject; with the result of frequent temporary relations, or a form of heterogamy. So the objection to the abolition of marriage laws holds good as regards a certain type of character, a type which seems, moreover, to be the prevalent one in some races of men.

The principal object of reform in this matter appears to the writer to be the securing of a practicable and protected monogamy. While this system preserves and develops the highest type of character when successful, when not judiciously or truly carried into effect, it may and does produce quite the opposite result. Divorce laws designed to meet the difficulty have been enacted by various countries. But in not a few of them they are inadequate to meet even the most ordinary contingencies, while in none are they applicable to the cases which arise among the best people. It ought not to be necessary to expose to public gaze the inner chambers of the heart; and to describe the life and death of the affections in legal phraseology is to render them ridiculous. Moreover, it is safe to leave a question in which two persons are so deeply interested, to themselves alone for solution, under such safeguards as are necessary for the conservation of the good which the monogamic system brings to society at large. That the interests of society require that matrimonial mistakes shall not be corrected, I do not believe; and the attempt to force people to live together in the marriage relation who, after a full

and fair trial, have found it impossible to do so in harmony or comfort, is a "relic of barbarism," fully as objectionable as the "twins," against which American politics so protests. Moreover, this attempt is rarely successful, but is responsible for a large part of the heterogamy that exists in so-called civilized countries. The number of married people to be found among prostitutes and their supporters is very large. Under proper marriage laws, a great proportion of these people might become monogamic, to their great advantage in every respect.

Of course, this cannot be done if legislators can be induced to share the absurd opinions prevalent in some quarters on this subject. In illustration, I cite the following resolutions, adopted by a meeting of ministers, held in Philadelphia, a few years ago:

"The chief requirement is the repeal of all laws allowing divorce for any offense except marital infidelity.

"Divorce should not be granted for marital infidelity when it is committed by connivance on the part of the plaintiff, or the application is not made within three years of the commission of the offense, or when the plaintiff also has committed the crime, or when the plaintiff has not resided in the State for a period of three years.

"When the divorce is granted for marital infidelity, the guilty party should not be allowed to marry again during the life of the plaintiff.

"In lieu of divorce for cruelty, substitute separation for a limited time or forever, and make provision for the support of the wife by the husband. Misconduct on the part of the plaintiff should be a bar to separation.

"The hearing of facts in all cases should be public."

This report was freely discussed by the ministers present, and it was ratified.

These resolutions seem expressly designed for the perpetuation of the real "twin relics of barbarism" of American society; compulsory marital relations and prostitution. Their origin is evidently due to that undefinable superstition against marital changes which is common in the less informed circles of society. It is a superstition that has its foundations in good, but one whose branches, spreading too widely, have been rather a upas tree than a healer of nations.

Extreme views on this point are probably largely due to the unconscious jealousy which forms so important an ingredient in human nature. It is charged against reformers who would do away with marriage laws that their views are only adapted to an ideal world, and not to real men and women; and the charge appears to me to be just. But it is equally applicable to the conservatives on the other side of the question, whose opinions betray either an ignorance of their kind, or an inhuman disregard of their happiness. Happily married people, and unmarried women, too often regard with utter indifference, mostly the result of ignorance, the sufferings and misfortunes of a large proportion of their fellow-beings; and, like

Dives, who has just dined, wonder how Lazarus can be so hungry. They confound misfortunes with crimes, and endeavor to punish those whom fate has already punished too severely. Any attempt to improve the condition of men in this direction inspires them with a groundless fear of some dire contingency which they do not understand and cannot explain, but which exists at their very doors, largely sustained by their own blindness and often insincerity.

It is in fact time that the merits of the present system of marriage shall be weighed against its demerits. I have no sympathy with those complacent dreamers who declare that no reform is necessary. The question is a pressing one, and the facts are before us. Eighteen hundred years of Christianity finds us in as great difficulties as ever, but with our sense of justice quickened, and our sympathies developed. We have as a basis the fact that most of the white race at least, are capable of a generous and self-sacrificing intersexual passion, which, if treated with reasonable consideration, is of a lasting character. That knowledge is now attainable which shows what the natural relations of the sexes are, so that neither sex need ask impossibilities of the other. The man must not demand of the woman the unsensitiveness and mental solidarity that he finds in his own sex; nor must the woman expect to control the man by force, whether of the tongue or otherwise. It is also safe to believe that no laws should separate a man and woman who have loved each other long enough, nor are any laws necessary to keep them together.

In this question the true position appears to the writer to be the golden mean. *In medio tutissimus ibis* is especially applicable here. What is necessary is that matrimonial changes shall be removed from the domain of caprice, and shall be only permitted after a full and fair trial. This object can be attained by a system of civil marriage contracts which shall run for a definite time, and terminate under conditions to be mentioned later. These contracts should be of the same value and effect as the existing marriage contract, and have the same bearing on the questions of support, property, and divorce, in general, as now provided by the laws of Pennsylvania, which are among the most reasonable in this country in this respect. The time limits of these contracts should increase rapidly so as to prevent women of mature years being deprived of support. The first contract ought not to run for less than five years, so as to give ample opportunity for acquaintance, and for the recovery from temporary disagreements. This is more just to both parties than the law as it existed among a nation of antiquity, where a couple were required to devote a year to the experiment before marriage was permitted. The first contract should be terminable at the desire of either

party. The second contract should run for ten or fifteen years, and should then lapse only by desire of both parties. A third contract providing for permanent relations should be then available. The practical operation of this system of contracts would be as follows: Previously unmarried persons should be required to take the first or five years contract. No choice should be permitted in the matter, for then each party would have a right to suspect the confidence of the other. They should take the contracts in the order stated, and should not be permitted to take one of shorter time on the expiration of one of longer time, if they desired to change their partner. Persons who had been married, and who desired to marry again, should be compelled to adopt the longer of the two contracts due to either of the parties, should their conditions differ in this respect. This would maintain the progressive increase in the duration of contracts which the project contemplates, and thus prevent a continued succession of short contracts. There should, however, be opportunity for the duplication of a second contract in the case of a person who should marry a previously unmarried person, which is a concession in favor of the inexperience of the latter person. In all cases of change the disposition of children would be the same as is now provided for by the laws relating to divorce. Disputes over the custody of children show that they do not generally, under such circumstances, lack for interested caretakers.

Such a system would offer a safe opportunity for the correction of errors in matrimony, and a chance for the reorganization and recommencement on a more hopeful basis of the lives of persons who have made such mistakes. It is probable that a first contract would furnish the experience necessary to a better understanding of the relation, and of a better line of conduct in practical life. A second change would be necessary to relatively few persons. In this way an immense number of marriages would be placed on a basis which would be both permanent and happy, and thus an immense amount of sexual irregularity and evil be wiped out of existence. The system may be found to be susceptible of improvement in some respects, and it might seem rather complex. But the laws regulating contracts as to the holding of ordinary property, are numerous and complicated, and we should not hesitate, for such a reason, to protect and cherish what is of more value to man than any material objects whatsoever.

The question of support presents the following aspect: The support of children by the father without aid from the mother would accord with justice, while a woman who had surrendered a marriage contract should occupy the position of a single woman, and return to her parents or support herself. The support of a woman while a wife is as obligatory on a man as

that of children, but the support of a woman to whom he is no longer married, should devolve on those who are her natural supporters in his absence. The proposition that a woman is injured by marriage, does not apply generally to a term of five years, and in that case she needs no financial equivalent. For the dissolution of the second contract, in later life, her own consent is necessary.

Various objections can be made to the above proposition. Some of these may be briefly noticed. First, that of the supernaturalist who believes that the present system is of divine origin and cannot be improved. He points to the language of Christ who forbade divorce, and to the expression "what God hath joined together let no man put asunder." It is, however, perfectly clear that marriages have been made between persons whom God did not join together. Christ also when he heard the expressions of astonishment from his disciples, relaxed somewhat and declared that his doctrine was for those who could "bear it." It is pretty evident that like universal peace, the world is not yet ready for the abolition of divorce, and why the teachers of the Christian religion should be so much less intelligent on this point of ethics than they are on most others, is only another illustration of the assertion made at the opening of this article, that we are not yet fully civilized in this direction.

The next objection is a sentimental one. When, at the expiration of the first contract, the one who has "*laisser s'aimer*" declines to continue the arrangement with the other party, who has done all the loving, it is easy to exclaim: What a hardship! But the hardship of being bound to one that you cannot love, is the greater of the two, for it is without remedy. The hardship of the unmarried person has a remedy; time and the expulsive effect of a new affection. It is a hardship which women are often compelled to inflict on men in single life, who generally survive it. It must be also remembered that the inferior in moral endowments will always love the superior in married life, a love which the superior may not be able to return. Or, it may happen that the source of the attraction lies in superior intellectual power. It is from gross *mésalliances* on these accounts that relief is needed, and the inferior person will be necessarily the loser.

Another objection comes from the chivalrous man, who fears for gentle women, possibly turned out on the world without support and with prospects blighted. This could only occur from the non-assumption of a new contract at the expiration of the first. The single opportunity for change after this requires the consent of both parties. But I expect a much larger number of women would be benefitted than injured by the opportunity for change offered at the expiration

of the first contract. It seems important that they should have the opportunity of terminating, of their own choice, an unfortunate relation. In fact, I suspect that more women than men would avail themselves of the opportunity, since a large majority of the divorce cases that come before our courts are brought by women. As to either sex having been injured by the experiment of a first contract, this would rarely be the case. Both parties would be greatly improved by it, and (if not too old) more desirable partners than the inexperienced. It is often a painful process to receive an education, and while one cannot always regard one's educator with pleasure, one can begin with another person, much improved in morals and manners. The five-years contract would also furnish to women a much needed protection against mere fortune-hunters.

Insincere objections will be made by heterogamists of both sexes, who speak of the sanctity of marriage only to cloak their vicious taste for promiscuity. People who talk of "stirpiculture" and the like will also probably object more sincerely. I can only say of this doctrine that it appears to me to have the evil effect of heterogamy on women, and to involve the sacrifice of the highest social affections of the race, and all that that carries with it.

In general, it will be urged against any reform in this direction that it weakens the strength of the bond and impairs the mutual confidence of man and wife. To this it may be answered that this could not occur if the law were compulsory on all alike. Moreover, the possibility of change would, in most instances, exercise a salutary influence over the conduct of the contracting parties.

A word may be now added on the subject of polygamy. This system has been made the target of abuse by press and people in this country; by the former largely as a political issue with which to get votes. The much worse and more barbarous system in our midst is not so frequently referred to. This is remarkable, in view of the fact that the prevalent form of religion reveres as holy men many polygamists, and professes to observe the ethical rules of the teacher of the New Testament, who never forbade it. He was wiser than some of our modern legislators, for he knew that the best way to deal with polygamy was to let it alone. It is a system of limited application in any country. None but the rich can sustain it, and if voluntary on the part of the woman, is only practicable under exceptional circumstances. But the heterogamic relation, unlike polygamy, involves, for men, no responsibility for women or children, and is much less expensive. Is this the reason why it is preferred?

A limited polygamy has been permitted by many nations of much civilization. The Roman law allowed

three wives. While the system of time-contracts here proposed would do away with polygamy under most conditions, there remain a few possibilities where it would be beneficial. For instance, one party to a first contract might be anxious to take a second contract at its expiration, while the other would decline it. But he or she might be willing to continue and take a second contract with the declining party, although he or she might take one with another person. This would be truly voluntary polygamy or polyandry, and if agreed to by all three parties, I see no objection to its being permitted. Under ordinary circumstances, very few persons would be found willing to make such a contract, but there are some cases of hardship which such permission would remedy. Such, for instance, would be the case where the man or woman had become the victim of a chronic disease; or, where either party should be childless, and in other contingencies that can be imagined. It must be understood that this suggestion involves no compulsion in any direction, and that it involves full responsibility in all directions precisely as under our present laws.

But apart from the objections already mentioned, polygamy constitutes a burthen upon men which impairs or destroys their effectiveness in any other direction. Little progress in the arts and sciences could be expected of a polygamous people, since their resources will be chiefly absorbed by their unwieldy domestic establishments, and the ways and means of supporting them.

#### DEATH, LOVE, IMMORTALITY.

How is it that our poets so often set into opposition the ideas, love and death? Is there a secret connection between them? and if so, can that connection be explained?

The Hebrew poet in the song of songs, sings:

"Set me as a seal upon thine heart,  
As a seal upon thine arm;  
For love is strong as death;  
Jealousy is cruel as the grave;  
The coals thereof are coals of fire,  
Which hath a most vehement flame.

"Many waters cannot quench love,  
Neither can the floods drown it:  
If a man would give all the substance of his house for love,  
It would utterly be contemned."

Love is strong as death, nay it is stronger; for if there is any power that can conquer the grimmest foe of man, it is love. Love therefore, as the conqueror of death, represents Immortality.

How many foolish conceptions of immortality obtain among mortals, and how often have they been refuted by the sages of all creeds and of all philosophies! Nevertheless, the belief in Immortality is as firmly rooted in the souls of men to-day as it ever has been in past ages. We have of late read that beautiful passage of the American heretic who rejects all religion,

who hates Christianity, and is in every respect an unbeliever. He has no ridicule, no flippant word however, for Immortality; he says:

"The idea of immortality, that, like a sea, has ebbed and flowed in the human heart, with its countless waves of hope and fear beating against the shores and rocks of time and fate, was not born of any book, nor of any creed, nor of any religion. It was born of human affection, and it will continue to ebb and flow beneath the mists and clouds of doubts and darkness as long as love kisses the lips of death.

"I have said a thousand times, and I say again, that we do not know, we cannot say, whether death is a wall or a door—the beginning, or end, of a day,—the spreading of pinions to soar, or the folding forever of wings—the rise or the set of a sun, or an endless life, that brings rapture and love to every one."

What is death? Is it not the destruction of that form of ours after it has become unfit for further use? It is maintained by the agnostic orator that we cannot know whether it is the rise or the set of a sun. Let me answer that to us death appears like the set of a sun; but we know that the sun itself never sets.\* As its light never ceases to shine, so life is immortal.

What is love but our longing for immortality? And the old man who looks upon his youthful sons and enjoys the baby-smile of his grandchild,—does not a new vista of life open to him? And is not that life that beams in the eyes of his children and grandchildren his very own life? Does he not commence a new career in every one of them? Is it mere sentimentality, an empty figure of speech if we say that Love has conquered death indeed? Let death have its prey, if we but live again, if instead of remaining as we are, small, limited, egotistic, we may grow and expand, if new chances of commencing life over again are given unto us, and if guided by love we can determine ourselves, how we may be improved in future generations! Let death have its prey, if our better selves, our noblest thoughts, our highest ideals, our best deeds will live in, and have a beneficial effect upon, future generations.

Love is not limited to sexual love. Love is enthusiasm for everything good and great; love is every true and noble idea worth being thought again and again, and to be propagated to the most distant generations.

Our body, the visible appearance of our ego, is sure to die; and there is no ground for bewailing it, for what is the use of preserving just this combination of dust with all its little defects,—a combination whose psychical components are a medley of a few true ideas, of a few lofty aspirations mixed with errors and prejudices? Is it worth while to preserve this alloy as it is? O no! It is thousand times more preferable to preserve the good, the true, the ideal thoughts only,

as Nature really does, and let errors as well as prejudices perish as they deserve.

Immortality is no fiction, and a craving for immortality is a natural feeling of the human heart. True immortality is not possible by egotism, for there exists no such a thing as an immortality of the ego. True immortality is realized by love only; and love is not only the affection toward our beloved ones; love is every aspiration for truth, every hope for progress, and every enthusiasm for the ideal. Love is the broadening of our soul beyond the limit of the ego. But it is not enlarged egotism; either; love has always something of a humanitarian and a universal spirit. It thrills our pulses with the life of the All and grants in a fleeting moment the bliss of a whole eternity.

Immortality is not presented to us by some generous donor as a gift. It must be gained by our own efforts; by our struggling for it must it be deserved. But there is that comfort in it that it can be gained by every one who believes in Love.

In this spirit the German poet says:

"Out of life there are two roads for every one open:  
To the ideal the one, the other will lead unto Death.  
Try to escape in freedom as long as you live, on the former,  
Ere on the latter you are doomed to destruction and death,"  
P. C.

#### THE SHRINKAGE OF VALUES.

BY WHEELBARROW.

I am just now engaged in exploring the dark recesses of monetary science, but I don't make much progress. It is a mammoth cave, full of labyrinths and passages. I fear that my guides are ignorant also. They pretend to know all its pathways, but the lights they carry only flicker in the gloomy vastness; guides and followers stumble along together. To rich men, the study of finance and its laws, may be of little consequence, but to me, whose wages never exceeds \$400 a year, it is of the highest importance that the money of the country should be of good material, and strong in market value. The rich man can protect himself against its fluctuations and its changes, its expansions and contractions, but I am helpless. The Secretary of the Treasury never consults me as to whether he shall buy bonds or sell them. The Chairman of the Ways and Means Committee never waits upon me at my office in the Sand Bank, to enquire whether I desire the coinage of silver dollars to go on or stop; the Judges of the Supreme Court do not care whether I want the legal tender act sustained or declared unconstitutional. Banking syndicates, Boards of Trade, Wall Streets, Incorporated Sweat Extractors of every kind, never inquire whether my dollar and-a-half a day will buy me enough to eat or not. For these reasons I desire to see the monetary policy of the country on a solid and scientific foundation. To me it is not a matter of party expediency; it is a question of bread.

\* Cf. Schopenhauer, Parerga und Paralipomena, über die Unzerstörbarkeit unseres Wesens durch den Tod.

I don't know how to build a house, but I can tell a good job of work when I see it. If I see a crack in the wall, I suspect a bad foundation, and I know that a botch has had something to do with it. When I find the Secretary of the Treasury paying off the 3 per cent. bonds, and further discover that the United States of America has bound itself by solemn treaty with the United States of Wall Street not to pay its 4 per cents, until the year 1907, I know that the job was a botch, and that the Congress who did the work was composed of a lot of "plugs." Either that, or they were knaves making bad laws for their own profit.

Much of the pleasure of my life has consisted in wishing my life away. My joy of an afternoon has been to see my shadow lengthen in the sun. As it grew longer my time of rest grew nearer. I have been honest than other men, because I was compelled to be. The luxury of cheating is not mine, for somebody is watching me forever. I have stolen a little rest occasionally by the fraudulent device of lighting my pipe with contrary matches, which would never burn until the impatient boss yelled at me, "Tom, it takes you a long time to light that pipe." One day when this occurred I seized my 'barrow, and walking down the plank, I thought like this, "He will not allow me to wheel up a light load; he will not permit me to clip a moment of time, is he so particular to pay good money for wages?" It flashed upon me all at once that he always paid me in the cheapest money that was current at the time, and it occurred to me also that I had been howling for payment in cheaper money still. The experience came full upon me the other day when, picking up a Chicago paper, I read this alarming heading to an editorial article, "Drifting toward dear money." It was evidently written by one of the stumbling guides of the mammoth cave.

What is dear money? Something dreadful certainly, for "drifting" suggests a ship, helpless, and rudderless moving to its doom. My fright ended when on reading the article I discovered that "dear money" meant something that would buy more goods than money of the cheaper sort; and when on reading further I saw that "dear money" included the calamity of cheap rent and clothes and fuel and bread, I shouted, "Let her drift." The artificial values that have been placed by bad laws upon the blessings of life, must come to an honest level some time or other, and the sooner the better for me.

The prime cause of this impending calamity, according to this bewildered guide, is the "virtual contraction of the total volume of exchangeable credit caused by the steady withdrawal and cancellation of about \$2,000,000,000 of United States National Bonds, which, in our exchanges with Europe, had performed the functions of an international currency jointly with

gold." Occult phrases have always been the stock in trade of conjurers, and this ponderous jargon about "exchangeable credit," complicated and confused with thousands of millions of dollars, is the device of a lost guide to conceal his ignorance of the road. He did not see that the bonds had been "cancelled" by payment, and that their vacant places had been filled by actual gold money, created by the labor of the people, and drawn from them by the surgical process known as taxation. "Exchangeable credit" is only the reverse side of a coin having "exchangeable debt" on its obverse side. A bond is only a promise to pay a debt, and the credit in it and the debt in it must travel the world together.

A great many fictitious attributes of goodness have been given of late to these bonds. The beneficent national banks have been built upon them; they furnish a convenient savings-box for widows and orphans to keep their money in; they make the "coupon clippers" loyal to the government, and many other miracles they do; now we are told that they make a fine article of "exchangeable credit," and "perform the functions of an international currency." If those bonds have all these virtues they are blessed things, and the war that brought them is entitled to all praise. I shall never believe that, for I was there from the beginning to the end. It was a bloody sacrifice; and the only consolation it ever brings to me is that it bought the freedom of the slave. The price was the highest ever paid for freedom in this world, but then, freedom is cheap at any price; many of the war curses are embalmed in those bonds to plague our children and our grand-children for a long time to come. The interest on them has been squeezed out of the laboring man, and converted into usury to oppress him. For all that I would not flinch a hair's breadth from either the letter or the spirit of the contract, but would redeem it to the last penny. I would stand up to a hard bargain as faithfully as to an easy one.

It is complained that this appreciation of money has diminished the value of real estate. The effect of this disaster upon me is that I must pay less rent. It is also complained that it has lowered the value of all merchandise. The only way in which this "shrinkage of values" is made manifest to me is in lower prices for everything I buy. Why then should I be troubled? "Because," retorts the capitalist, "it means a shrinkage of wages too." I am not afraid of that. It is a lying old ghost that will never scare me again. The resources of the country still exist; the necessities of mankind are just the same, and the labor of men upon those resources is as valuable as it ever was. There is no "shrinkage of values." Bad laws made by bad men in the interest of speculation, usury, and monopoly, have made an artificial increase of prices, and

when those prices begin to fall in obedience to the claims of honest industry, extortion sets up a howl that "values are shrinking." The "value" of a house cannot shrink, except from physical causes, any more than the walls can shrink. The rent may shrink when the artificial causes that have swollen it cease to operate, but the honest and legitimate value of the house remains the same. I think the time has come when workingmen may profitably unlearn much of their old economy, and reverse their opinions as to the blessings of cheap money. Dear money is the rightful reward of honest labor, and that money we should insist upon.

## CORRESPONDENCE.

### POLITICS AND RELIGION.

*Friend Hegeler:—*

I have just read thy article on "Protection" in THE OPEN COURT and think it unethical. Now, in the *Friend Int.*, a copy of which I enclose thee, is published a political article on a "lyleaf," of which I doubted the propriety in a religious journal, but they did it in time for a reply before the election, upon this "burning question." *This thee did not do!* and thee has for this reason greatly mortified me. I expected better things of THE OPEN COURT. I am an older man I judge than thee, and I saw the United States drained of its gold by a low tariff in the time between the years 1846 and 1857, so that in 1861 we had to pay 12 per cent. on account of government loans under James Buchanan.

I was engaged in active business during the Forties, and am a witness of the general depression and embarrassment which was caused by the abrogation of the protective tariff of 1842, and the substitution of the revenue tariff of 1846. The price of land in the neighborhood of Philadelphia which had enhanced in value, received a great check, and all kind of business was depressed by the change of policy on the part of the government.

Respectfully, DAVID NEWPORT.

WILLOW GROVE, November 5, 1888.

*David Newport, Esq.,*

WILLOW GROVE,

MONTGOMERY CO., PA.

MY DEAR SIR:—Your favor of the 5th inst. has reached me to-day. I wish I had succeeded at an earlier date in writing the article on "Free Trade and Protection," for the reason that it would then have had more practical effect, as well as the reason that subscribers of THE OPEN COURT could thus have had an opportunity to express their views before the election.

Being no professional writer, I did not make any progress in writing the article but until a few days before its publication; when warming up under the opposition to my views in local circles. The article was not finished until about 11 o'clock at night before publication day.

The idea you utter, that the propriety may be doubted of publishing a political article in a religious journal, has occurred also to me and has contributed to its late appearance.

I have arrived at the conviction that THE OPEN COURT has to treat the ethical side of important political questions. Philosophical opinions that have assumed the religious character force their bearers openly to apply them to all important issues of mankind.

Sincerely yours

EDWARD C. HEGELER.

LA SALLE, November 11, 1888

## BOOK REVIEWS.

MORAL-PHILOSOPHIE. Gemeinverständlich dargestellt von Georg von Güzky. Leipzig: Verlag von W. Friedrich.

Prof. Güzky's latest publication will be the more interesting to American readers as the author has allowed himself to be not a little influenced by American thinkers, especially Dr. Stanton Coit, Wm. M. Salter, and Felix Adler. His book represents a moral philosophy, which finds its most appropriate realization in the societies for ethical culture of the United States. The author, whose former publications were most closely allied to utilitarianism, it seems, has modified his position to some extent. He bases his ethics now on the maxim: "*Strebs nach Gewissensfrieden, indem du dem Wohle der Menschheit dich weihst.*" (Strive for peace of soul by devoting thyself to the welfare of humanity). This ethical system is explained, on 540 pages, in chapters treating of the basis of morals, the aim of life, duty, virtue, free-will and determinism, responsibility, morals and theology, nature and morals. Prof. Güzky finds a poetical expression of the fundamental truths which he has laid down in his ethics, in Goethe's poem:

Man must be noble  
Helpful and good!  
For that alone  
Distinguishes him  
From all things  
Known to us.

Nature around us  
Is without feeling:  
The Sun sheds his light  
O'er the good and the evil;  
The Moon and the Stars shine  
Upon the guilty  
As well as the honest.

Storms and torrents,  
Hail and thunder,  
Roar their course  
Seizing and taking  
All before them,  
All alike.

Thus also Fortune  
Gropes 'mid the crowd,  
Seizing now the schoolboy's  
Curly innocence,  
Now, too, the gray crown  
Of aged guilt.

But man can accomplish,—  
Man alone,—the impossible;  
He discriminates,  
Chooses and judges;  
To the fleeting moment  
He gives duration.

His alone it is,  
To reward the good  
To punish the wicked,  
To save and to rescue,  
To dispose, with foresight,  
The erring, the straying.

Let the noble man  
Be helpful and good,  
Untriflingly do  
What is useful and just!

JOHN BODEWIN'S TESTIMONY. *Mary Halleck Foote*, Boston: Ticknor & Co.

We are glad to see this story, which we have always liked, in its new and cheaper form. (Ticknor's paper edition). It is, we believe, the author's first long story, and one that well assures her ability in that line of work, both in the construction of plot and delineation of character. C. F. W.

THE ROMAN CATHOLIC CHURCH AND THE SCHOOL QUESTION. By *Edwin D. Mead*, Boston: 1888. George H. Ellis, 15 Cents.

The above little pamphlet is a cool and impartial criticism of the Parochial School System in the United States. It is written from a purely secular standpoint, and proposes to meet the arguments and pretensions of the advocates of that system by considerations of public policy and national interest. It calls upon the fair-minded of all religious denominations to avoid the narrowing influence of a sectarian education:

" \* \* \* We do not want, any of us, Catholic reading-books, nor Quaker spelling-books, nor Jewish geographies, nor Baptist histories, nor Presbyterian grammars, nor High Church cook books, nor Unitarian geologies, nor Trinitarian arithmetics. \* \* \* I wish for one that we might see a decadence of private schools altogether. No one could speak more warmly than I of many of the private schools of Boston and of other cities, and the private school doubtless has a certain proper place, but I do not wish to see the system grow. I have little more affection for the Protestant private school than for the Catholic. The private school tends to create and encourage class distinctions, it draws away the personal interest of many parents, men whose interest we most need, from the public school, it does not make for sturdiness, it does not make for democracy, it does not make for public spirit."

POETRY, COMEDY, AND DUTY. C. C. Everett. Boston: Houghton, Mifflin & Co.

Prof. Everett is well, if not popularly, known as one of the most thorough and cultured thinkers we have, and a volume from his pen is sure to command attention from a large class of thoughtful readers. The grouping together poetry, comedy, and duty as separate but kindred factors in the evolution of character may seem an odd combination at first, yet all doubt of the worth and truth of the author's purpose wears away as soon as one begins to read. Under poetry Prof. Everett treats somewhat at length of the function of the imagination, which he defines as "the power of mental vision, a power which creates that which it beholds"; and a necessary element of human consciousness and action everywhere. He speaks of the use which science makes of the imagination, as illustrated in Tyndall's great essay on this subject, and shows very clearly that the successful business man must also rely on this same faculty. "Art and poetry are methods or instruments of the imagination, and these complete the world." The next portion of this essay is entitled "The Philosophy of Poetry," in which poetry is counted among the representative arts, since "even in its lyrical form it does not directly express passion; it represents it." In a study of the "Poetic Aspects of Nature" we are led to see how beauty, expressed in poetic images and forms, becomes an essential factor in human conduct and aspiration. We have not so much space to bestow on the essay on Comedy, in which the author seeks to show the compensating influences of the comic; "In the comic we are taken into the world of surfaces." The real world, even that of beauty imposes too severe a strain on the mind when in constant contemplation, which the humorous relieves. The essay on Duty is earnest, philosophical, and pervaded with the glow of a fine idealism throughout. With John Fiske, the writer gives high rank to the power of sympathy as a motive in human action. In conclusion we are shown how poetry, embodying noble and beautiful images, serves as a constant inspiration to man, and

comedy as "a great corrector" of exaggeration. Prof. Everett's book is both valuable and interesting. C. F. W.

## NOTES.

Mr. David Newport's remark as to the causes of financial depression in the Forties are not in harmony with the views of Mr. Hugh McCulloch as set forth in his recently published book, "Men and Measures of Half a Century."

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXVI—Continued.

The Professor received the desired permission. Ilse made her preparations for the journey with a solemn seriousness which struck all around her. She was now to approach the presence of her Sovereign, whom she had regarded from a distance with shy respect. It made her heart heavy to think that the son had never spoken of his father, and that she knew nothing of her illustrious master but his countenance and manner. She asked herself, anxiously: "How will he treat Felix and me?"

Whilst Felix was collecting all the books and documents which were indispensable for the journey, the Doctor was standing sorrowful in his friend's room. He was satisfied that the Professor could not withdraw from the duty of seeking for the manuscript; and yet his invitation to Court did not please him. The sudden breaking of their tranquil life disturbed him, and he sometimes looked anxiously at Ilse.

Laura sat, the last evening, near Ilse, leaning on her shoulder, weeping. "It appears to me," said the latter, "that something portentous lies in my path, and I go in fear. But I leave you without anxiety for your future, although you have sometimes made me uneasy, you stubborn little puss; for I know there is one who will always be your best adviser, even though you should seldom see each other."

"I lose him when I lose you," cried Laura, in tears. "All vanishes that has been the happiness of my life. In the little garden which I have secretly laid out for myself, the blossoms are torn up by the roots, the bitter trial of deprivation has come to me also; and poor Fritz, who already was practicing resignation, will now be quite lost in his hermitage."

Even Gabriel, who was to accompany the travelers to the capital and await their return home from abroad at the house of Ilse's father, was excited during this

\* Translation copyrighted.

period, and often disappeared into the house of Mr. Hahn when it became dark. The last day he brought home from the market a beautiful bird of uncommon appearance, with colored feathers, pasted on a sheet, with the inscription: "Peacock from Madagascar." Gabriel wrote, in addition, in clear, stiff characters: "Faithful unto death." This he took in the evening to the enemy's house. A whispering might be heard there, and a pocket-handkerchief be seen, which wiped the tears from sorrowful eyes.

"No allusion is meant to the name of this family," said Gabriel, holding the bird once more in the moonlight, the beams of which fell through the staircase window upon two sorrowful faces; "but it occurred to me as a remembrance. When you look at it think of me, and the words I have written on it. We must part, but it is hard to do so." The honest fellow pulled out his pocket-handkerchief.

Dorchen took it from him; she had forgotten her own, and wiped her eyes with it.

"It is not for long," said Gabriel, consolingly, in spite of his own sorrow. "Paste the bird on the cover of your trunk, and when you open it and take out a good dress, think of me."

"Always," cried Dorchen, weeping. "I do not need that."

"When I return, Dorchen, we will talk further of what is to become of us, and I hope all will go well. The handkerchief which has received your tears shall be a remembrance for me."

"Leave it to me," said Dorchen, sobbing. "I must tell you I have bought wool, and will embroider you a wallet. This you shall carry about you, and when I write, put my letters in it."

Gabriel looked happy, in spite of his sorrow; and the moon glanced jeeringly down on the kisses and vows which were exchanged.

#### CHAPTER XXVII.

##### THE SOVEREIGN.

The Hereditary Prince was walking with the Chamberlain in the gardens which surrounded the royal castle on three sides. He looked indifferently on the splendid coloring of the early flowers and the fresh green of the trees; to-day he was more silent than usual; whilst the birds piped to him from the branches, and the spring breeze wafted fragrance from the tops of the trees, he played with his eye-glass. "What bird is that singing?" he asked, at last, awakening from his apathy.

The Chamberlain replied, "It is a thrush."

The Prince examined the bird with his glasses, and then asked, carelessly, "What are those people ahead of us carrying?"

"Chairs for the pavilion," answered the Chamber-

lain; "it is being arranged for Professor Werner. The house is seldom open now; formerly his Highness, the Sovereign, used to live there occasionally."

"I do not remember ever having been in it for a very long time."

"Would your Highness like to see the rooms?"

"We can pass that way."

The Chamberlain turned towards the pavilion; the Marshal was standing at the door; he had come to see that everything was in order. The Hereditary Prince greeted him, cast a cursory glance at the house, and was inclined to pass on. It was a small grey-stone structure, in old fashioned style; there were shell-shaped arabesques round the doors and windows, and little dropsical angels supported heavy garlands of stone flowers with lines which appeared to have been cut out of elephant's hide; the angels themselves looked as if they had just crept out of a dirty swamp and been dried in the sun. The dark building stood amid the fresh verdure like a large chest, in which all the withered flowers that the garden had ever borne, and all the moss which the gardener had ever scraped from the trees, seemed to have been kept for later generations.

"It is an uninviting looking place," said the Prince.

"It is the gloomy appearance that has always pleased his Sovereign Highness so much," replied the Marshal. "Will not your Highness examine the interior?"

The Prince passed slowly up the steps and through the apartments. The musty smell of the long-closed rooms had not been removed by the pastiles that had been burnt in them; logs were blazing in all the fireplaces, but the warmth which they spread still struggled with the damp air. The arrangement of the rooms was throughout orderly and complete. There were heavy *portières*, curtains with large tassels, and fantastic furniture with much gilding, and white covers for the preservation of the silk, mirrors with broad fantastic frames, round the chimney-piece garlands carved in grey marble, and upon it wreathed vases and little figures of painted porcelain. In the boudoir, on a marble console, there was a large clock under a glass bell; a nude gilded nymph poured water over the dial from her urn which was turned to gilded ice. Everything was richly adorned; but the whole arrangement, furniture, porcelain, and walls, looked as if no eye had ever rested on them with pleasure, nor careful housewife rejoiced in their possession. There were remarkable things from every part of the world; first they had been placed in the large assembly-rooms which were opened at Court fêtes; then they had ceased to be in fashion, and were moved into side-rooms. It was now their destiny to be handed down from one

generation to another, and counted once a year to see if they were still there. Thus they passed a never-ending existence—preserved, but not used; kept, but disregarded.

"It is damp and cold here," said the Prince, looking round upon the walls, and again hastening into the open air.

"How do the arrangements please your Highness?" asked the Marshal.

"They will do very well," answered the Prince, "except the pictures."

"Some of them certainly are rather improper," acknowledged the Marshal.

"My father would be pleased if you could remove these. When is Professor Werner expected?"

"This evening," replied the Chamberlain. "Perhaps your Highness would wish to receive the guest after his arrival, or to pay him a visit yourself."

"You may ask my father," replied the Prince.

When the Prince went with his companion up the staircase to his own rooms in the castle, the Chamberlain began:

"The Professor's wife was very much pleased once with the flowers which your Highness sent her. May I commission the Court gardener to put some in her room?"

"Do what you think fitting," replied the Prince, coldly.

He entered his apartment, looked behind him to see if he were alone, and went with rapid steps to the window; from thence he looked over the level lawn and the blooming rows of trees to the pavilion. He gazed long through the window, then took a book from the table and seated himself in the corner of the sofa to read; but he laid the book on the table again, paced hastily up and down, and looked at his watch.

The Court dinner was over. The ladies cast a half glance behind them to see if the back-ground was clear for their retiring curtsies. The gentlemen took their hats under their arms. The Marshal approached the door, and held his gold-headed stick with graceful deportment—a sure sign that the royal party was about to break up. The Princess, who was still in mourning, stopped her brother.

"When do they come? I am so curious," she said, in a low tone.

"They are perhaps already there," answered he, looking down.

"I am going to the theatre to-day for the first time again," continued the Princess. "Come into my box if you can."

The Prince nodded. Information came to the Marshal, which he conveyed to the Prince's father. "Your teacher, Professor Werner, is come," said he, aloud, to his son. "You will undoubtedly wish to pay your

compliments to him." He then bowed to the Court, and the young Princess followed him out of the room.

The Chamberlain hastened to the pavilion. The Marshal followed more quietly. A royal equipage had brought the travelers from the nearest station. They passed rapidly by the trees in the park, the pleasure-grounds, and the lighted windows of the royal castle. The pavilion was no longer a shapeless building, as it appeared in the day, under the glaring sun, to the indifferent eyes of the courtiers. The moon lighted up the front, and shone with a glimmering halo on the walls; it threw a silver glitter on the cheeks of the angels, and on the solid broad leaves of their garlands, and brought out strongly on the bright surface of the wall the shadows of the projecting cornices. Wax-lights shone through the open door. Lackeys, in rich liveries, held heavy candelabra. The steward of the house, a friendly looking personage, in dress coat and knee-breeches, stood in the hall and greeted the comers with polite words. Following the lackeys, Ilse ascended the carpeted steps, on her husband's arm, and when the servant threw back the *portière*, and the row of rooms appeared shining with wax-lights, she could hardly suppress an exclamation of astonishment. The steward led them through the rooms, explained the disposal of them, and Ilse perceived, with rapid glance, how stately and comfortable they all were. She looked with admiration at the abundance of flowers which were placed in the vases and bowls. She wondered whether her little Prince had shown this tender attention, but was undeceived when the official announced that the Chamberlain had sent them. A pretty maid was introduced, who was to wait upon her exclusively. Gabriel stood in the ante-room considering where he and his traps would be taken, in order that the Professor's boots might, in the morning, be no dishonor to the splendor of the house. At last one of the lackeys showed him his room, and, like a good comrade, pointed out to him the lamps of a tavern, which for his leisure hours would be particularly agreeable.

Ilse went through the rooms as if stupefied by their splendor, and endeavored to open the window to let in some fresh air, for the strong fragrance of the hyacinths threatened her with headache. Then came the Chamberlain, behind him the Marshal, who was also an urbane gentleman of very refined appearance; and both expressed their pleasure at seeing the Professor and his wife. They offered their services on all occasions, and pointed out from the windows the position of the pavilion. Suddenly the lackey threw open the folding-doors, announcing "His Highness, the Hereditary Prince."

(To be continued.)

## FORMER CONTRIBUTIONS TO "THE OPEN COURT."

E. P. POWELL.

The American scholar, E. P. Powell, gives his views on "Language" in Nos. 24 and 26. He maintains that language, as a means of communication, is possessed by all the animal creation, even down to the lowest in the scale of being; that all communicate with one another; that all of them have a language to express their wants and especially to express hunger. This lies at the root of the principle of evolution, because "organic development is necessitated in the direction of organic power to express - to speak."

W. D. GUNNING.

Mr. W. D. Gunning's essay *Katzenjammer*, in No. 1, is a sprightly, half humorous, half serious lay sermon, sending shafts of light into the dark recesses of the mind. *Katzenjammer* is a German word, which means cat-sickness, and denotes a malady of body and mind which results from night-life. The owl, the night-hawk, the whip-poor-will and all the felines are night-prowlers. Men also have gone astray with the cats and become nocturnal; even Socrates, with all his virtues was somewhat addicted to *Katzenjammer*. *Katzenjammer* was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a *Katzenjammer*'s-band was that of Cataline! What *Katzenjammer* was that of Nero fiddling in the light of burning Rome! Struggle for life drove one member of a certain family higher into the air, and another into the ground. The sun-seeker gained in eye and brain, the earth-burrower lost its eyes and retained only brain enough to guide it through the ground. Such are the fates of the mole and the bat. Igrasil the tree of life has been pushing its human fruit inward to the shade. We want a peripheral humanity lit by beams of science and sweetened and mellowed by active rays of the sun of righteousness.

MORRISON I. SWIFT.

In No. 23 Morrison I. Swift makes a vigorous appeal to the churches that they become actively interested in what is generally known as "The Social Problem," and that they take the lead in Christianizing the people after the manner practiced by Jesus in Judea and by his disciples, as related in the New Testament. Mr. Swift's language is clear, eloquent, pervaded by an ideal humanitarianism, and is not only respectful to the clergy but even reverent. He thinks the opportunities of the present and the future are in the hands of the churches, and that the clergy may lead the van of social progress instead of trailing along behind the baggage wagons, as they have so long been contented to do. "In this country," he says, "where the church has the allegiance of so large a portion of the people, where it represents a large proportion of the specially organized moral forces of the land, where finally its material resources are almost unlimited and the money power of the country is its friend and supporter, it would be possible for the church to bring about the reform that is needed, with little difficulty, if it desired to do so." Here Mr. Swift is confronted with the important objection that should the church take the lead in the social revolution or even in social reformation so far as "to establish such fair distribution of the products of human industry that superabundance and luxury will not exist," the "money power of the country" would cease to be its "friend and supporter" and the clergy might cease to be a priesthood. He presents the difficulty thus: "It is said by some that the pulpit will not go much beyond those who maintain it. This is to acknowledge that the opinions of the clergy are to-day bought and paid for, just as lawyers are hired and legislators sent to uphold the ideas of their constituency." Notwithstanding this difficulty, Mr. Swift sees "a slumbering lion in the Christian ministry, which will, ere long, awaken and put forth its formidable powers for the poor and the oppressed."

GEORG VON GIZYCKI.

In Nos. 25 and 26 is presented a very scientific article entitled "Determinism versus Indeterminism," by Georg Von Gizycki, Professor of Philosophy at the University of Berlin. This is in answer to Professor William James of Harvard University, who, in a lecture published in the *Unitarian Review*, had maintained the doctrine of *indeterminism*. The whole inquiry relates to the Freedom of the Will, and the terms are thus explained:

"The question whether the actions of the will are phenomena which act in conformity to a law, admits of only two answers—yes and no.

The philosophical theory which holds that they do, has been called *Determinism*; that which says they do not is known as *Indeterminism*."

The argument, which is deeply philosophical throughout, and in some parts of it a demonstration, proceeds upon the theory that the human will is under the control of law, and that its actions are determined by necessity; that Freedom of the Will is never an accident, nor the offspring of caprice; that the reformation of an evil-doer is made by surrounding him with conditions whose laws will compel his will to act in the right way.

## PAMPHLETS ON LIVING QUESTIONS.

Truths for the Times. By Francis Ellingwood Abbot. "The great inspiration of the Nineteenth Century is faith in the ideal unities as possible in fact." Price, 10 cents.

Fear of the Living God. By O. B. Frothingham. Price, 5 cents.

Lecture on the Bible. By Rev. Charles Voysey. Price, 10 cents.

Christian Propagandism. By Francis Ellingwood Abbot. Price, 10 cents.

God in the Constitution. By Rev. Arthur B. Bradford. Price, 10 cents.

Compulsory Education. By Francis Ellingwood Abbot. Price, 5 cents.

The Present Heaven. By O. B. Frothingham. Price, 5 cents.

On the Vision of Heaven. By Prof. Francis W. Newman. Price, 5 cents.

A Study of Religion. By Francis Ellingwood Abbot. Price, 10 cents.

The Battle of Syracuse. Two essays by James Freeman Clarke and Francis Ellingwood Abbot. Price, 10 cents.

The Sympathy of Religions. By Thomas Wentworth Higginson. Enlarged edition, 38 pages. Price, 5 cents.

Evolution and Religion. By John Fiske. Price, 5 cents.

Gordano Bruno and the Relation of his Philosophy to Free Thought. By Thomas Davidson. Price, 10 cents.

Transcendentalism. By Theodore Parker. 39 pages. Price, 5 cents.

The Public School Question, as understood by a Catholic American citizen and a Liberal American citizen. By Bishop McQuaid and Francis Ellingwood Abbot. 100 pages. Price, 10 cents.

Evolution in Its Relations to Evangelical Religion. By B. F. Underwood, Prof. P. A. Chadbourne and Prof. A. Gray. Price, 5 cents.

Messianic Expectations. By Rabbi Solomon Schindler. I. Introductory 5 cents; II. Two Thousand Years Ago, 5 cents; III. The Carpenter's Son, 5 cents; IV. Judaism the Mother and Christianity the Daughter, 5 cents. V. A Genuine Messiah, 5 cents. The five lectures for 20 cents.

The Proposed Christian Amendment to the Constitution of the United States. Price, 5 cents.

The Scientific and Metaphysical Methods in Philosophy, as affecting certain problems of religion and life. By Lewis G. James. Price, 10 cents.

How Shall We Keep Sunday? An Answer in four parts: 1. Sunday in the Bible, by Charles K. Whipple. 2. Sunday in Church History, by Minot J. Savage. 3. Sunday in the Massachusetts Laws, by Charles E. Pratt. 4. The Workingman's Sunday, by William C. Gannett. 100 pages. Price, 10 cents.

Social Ideals. By David A. Wasson. Price, 10 cents.

The Decay of the Christian Church: its Causes and Remedy. By Rev. J. C. F. Crombie. Price, 15 cents.

Natural Religion. By James Vila Blake. Price, 5 cents.

The Family Purse. By James Vila Blake. Price, 2 cents.

The Philosophy of a Strike. By N. A. Dunoiag. Price, 5 cents.

Uplifts of Heart and Will. A series of religious meditations or aspirations. By James H. West. Price, 20 cents.

A complete set of the Pamphlets named in this advertisement, including about 800 pages of valuable matter, will be mailed to non address on receipt of one dollar; separate pamphlets mailed on receipt of price.

CHARLES H. KERR &amp; CO., Publishers.

175 Dearborn Street, Chicago.

## D. LOTHROP COMPANY'S NEW PUBLICATIONS.

## THE LOST EARL.

With other Poems and Tales in Verse. By J. T. TOWNSEND. Now first published in book form. Illustrated, 8vo, cloth, \$2.00.

## THE LUCK OF EDENHALL.

By AMANDA B. HARRIS. All the romantic stories and legends of the famous fairy class, the old ballads about it, the story of the out Longfellow wrote—a portrait of the glass itself, and many charming drawings made at Edenhall last summer by Edmund H. Garrett. In box, 60 cents.

## Warwick Brookes' Pencil Pictures of Child-Life.

With Biographical Reminiscences. By T. LETHBRIDGE. It is strange in these art-loving days, that a man whose pictures of child-life are unrivalled by old or modern masters—in ideal innocence and artistic charms of artlessness—should be almost unknown. Small quarto, in box, \$1.25.

## LONGFELLOW REMEMBRANCE BOOK.

An outline of the poet's life, by E. S. BROOKS; the story of his boyhood, a record of his home-life and a recital of his relations with children, by Rev. Samuel Longfellow; Whittier's memorial poem; an account of the unweaving in Westminster Abbey; Miss Guiney's poem on that occasion—with portraits and illustrations. Small quarto, in box, \$1.25.

## A DISSERTATION UPON ROAST PIG.

By CHARLES LAMB. A separate issue of the humorous masterpieces of the gentle "Elia," characteristically illustrated with twelve designs by L. J. Bridgman. Small quarto, \$1.00.

## THE STORY OF THE AMERICAN SAILOR.

By ELBRIDGE S. BROOKS (uniform with "The Story of the American Indian" by the same author). The first consecutive narrative yet attempted, sketching the rise and development of the American seaman on board merchant vessel and man-of-war.

## A QUEER LITTLE PRINCESS.

By FRANCES EATON. This story has an indescribable charm not unlike that of "Little Lord Fauntleroy," though totally unlike in character, and like that is destined to become a famous "child classic." The little girl who was nicknamed "Princess" from her babyhood is a charming creation and will win all hearts by her ingenuousness and grace. \$1.50.

## LIFE AMONG THE GERMAN.

By EMMA LOUISE PARRY. \$1.50. "It is seldom that so realistic a picture of foreign life is found; one so rounded and satisfactory in every way. The book is full of valuable information to those who seek Germany for study or for travel."—Boston *Traveler*.

## VOLCANOES AND EARTHQUAKES.

By SAMUEL KNEELAND, A.M. 8vo. \$2.50. Sixteen full-page illustrations.

SEND FOR CATALOGUE.

D. LOTHROP COMPANY, Publishers, BOSTON.

## Recent Contributions to 'The Open Court.'

## THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

By S. ARTHUR STRONG. . . . . In No. 63.

An instructive essay upon the purposes of the Hibbert Foundation, with a review of the recent lectures by Prof. John Rhys upon the religion of the ancient Celts. The original investigations of Prof. Rhys have thrown a new and welcome light upon

A vivid account of the author's experiences while visiting these wonderful phenomena in Japan, Iceland, the Hawaiian and Philippine Islands, the Mediterranean Basin, Spain, and the United States. It is a book of valuable information which one can read with pleasure, and which young people will enjoy as much as stories of adventure.

## THE STORY OF THE STATES.

Edited by ELBRIDGE S. BROOKS. 12mo. Illustrated. \$1.50 each.

A notable series of popular histories detailing the rise and development of the several States of the American Union. Graphic, entertaining, and picturesque in style, the volumes tend to increase the growing interest in American history, and to popularize a subject heretofore voted dull and uninteresting. *New ready:* "The Story of New York," by Elbridge S. Brooks; "The Story of Ohio," by Alexander Black. *In Press:* "The Story of Louisiana," by Maurice Thompson; "The Story of Vermont," by John Heaton.

## THE STORY OF THE AMERICAN INDIAN.

By ELBRIDGE S. BROOKS. \$2.50.

A thorough compendium of the archaeology, history, present standing, and of our nation's words. It is clearly and concisely written, and embodies a vast deal of pertinent information. —*Literary World*.

## THE ART OF LIVING.

From the writings of SAMUEL SMILES. Introduction by A. P. Peabody, LL.D. \$1.00.

This is not a collection of dry maxims, but bright, apt thoughts on life's common duties and pleasures. Its charm consists in the practical wisdom which shows how to make the most of small opportunities.

## THE RUSSIAN NOVELIST.

By VICOMTE E. M. DE VOGUE. Translated by Jane Loring Edmonds. \$1.50.

All lovers of Russian fiction, and all students of the great social movements of the day, will be charmed by the perusal of this book, which shows the distinctive styles of Russia's four great authors,—Gogol, Turgenev, Dostoevsky, and Tolstoy,—with a keen analysis of their different works.

## SOUVENIRS OF MY TIME.

By JESSIE BENTON FREMONT. 12mo. \$1.50.

Mrs. Fremont has enjoyed the privileges of high social and official position, and her personal acquaintance with distinguished personages has been unusually large. Hence the wide range and the historic interest of these "Souvenirs," which describe early days in Washington, romantic life in the far West, and delightful experiences in European camps.

## THOUGHTS OF BEAUTY AND WORDS OF WISDOM.

From the writings of JOHN RUSKIN. Compiled by Rose Porter. 12mo. \$1.00.

It was a felicitous idea to garner from Ruskin's many books some of his most beautiful sayings, that the general reader might be made familiar with the exquisite thoughts of a man whose whole soul was aflame with enthusiasm for the pure in nature and in art.

the forms of belief in ancient Gaul, Wales, and Ireland, and they are regarded as a monumental work in the province of philological archaeology.

## THE SPIRITUALIST'S CONFESSION.

By MONCURE D. CONWAY. . . . . In No. 63.

An interesting article upon the recent confession of the Fox Sisters at the Academy of Music, N. Y., with a short historical sketch of the Spiritualist movement in America and England.

## Recent Contributions to 'The Open Court.'

## FREE TRADE AND PROTECTION.

By EDWARD C. HEGELER. . . . . In No. 62.

Political questions have not been introduced into **THE OPEN COURT**; but as the burning questions of the day must be judged from ethical principles, the problem of Protection or Free Trade is here viewed from the religious, i. e. humanitarian standpoint. The general ethical law is: "Aspire to a higher humanity." How shall we attain to this higher humanity? by protection? by restricting other nations from competing with us? by taking advantage of temporary international circumstances? No. Experience shows that *competition* is the foundation of progress. The truly ethical policy is that which affords the greatest opportunities and offers the least obstacles to the onward movement of the human race. Thus, from the humanitarian point of view, protection fails to stand the test.

Three Introductory Lectures  
—on—

## The Science of Thought.

(First published in THE OPEN COURT of June, July,  
and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

THE OPEN COURT PUBLISHING CO.  
169-175 La Salle Street. Chicago.

Neatly Bound in Cloth. Price, 75 Cts.

### PRESS NOTICES.

- "Full of novel thought."—*Chicago Herald.*
- "The subject is discussed with great clearness and simplicity."—*Book Chat.*
- "The absurdity of the theory is manifest."—*New York Science.*
- "No other writer concentrates so much in such simple language."—*Baltimore Sunday News.*
- "The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic.*
- "Max Müller's supremely simple theory is hotly disputed,—but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon.*
- "The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times.*
- "The lectures are able presentations of certain views in mental philosophy by one who is a recognized authority upon that subject, and will be read with interest by students and scholars."—*Cincinnati Times Star.*

## THE IDEA OF GOD.

By PAUL CARUS, Ph.D.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

**OPEN COURT PUBLISHING COMPANY,**

169-175 LA SALLE STREET,  
P. O. Drawer F, Chicago, Illinois.

Republished in Pamphlet Form.

## The Marriage Problem.

By E. D. COPE, Ph.D.

PRICE 15 CENTS.

A scientific discussion, from a practical standpoint, of the question now engrossing the public attention.

**OPEN COURT PUBLISHING CO.,**

169-175 LA SALLE STREET,  
P. O. Drawer F, Chicago, Illinois.

**STUDIES OF HOLLAND.**—By Edwin D. Mead.

## A PHILOSOPHICAL VIEW OF THE LAW OF CORPORATIONS.

BY CHARLES T. PALMER.

"The great teachers of the world are not those who enforce precedents, but those who unfold eternal principles."—*Munger*.

Once in four years the average man pays the debt of patriotism he owes to his country, for the remaining three his mind is absorbed in personal affairs; as far as public duties are concerned he is inactive. It is, perhaps, too much to expect that in return for the "blessings of liberty," men will practice "eternal vigilance"; but it is not too much to demand that every citizen rise to a just appreciation of his weight and worth in the community.

In a government like ours, with its complex system of laws, combining the positive enactments of legislative bodies and the rules of common law derived from the habits and customs of the people, the humblest has an importance equal to the greatest citizen. Not alone in political campaigns is his influence felt, but every day throughout the period of his citizenship his character, his habits, even his private opinions, impress themselves upon the laws of the land.

Public opinion is but an aggregation of the private opinions of many individuals, and public opinion may be styled the parent of law. Whether just or unjust, morally right or wrong, beneficent or iniquitous, so long as it constitutes the will of the majority, it will find an adequate enforcement; if not in acknowledged rules of law, at least in a biased administration of the courts.

The same influence which leads to the enactment of pernicious laws, leads also to an unjust discrimination in the enforcement of law. A popular prejudice has power to permeate the very sanctuary of justice, its influence is not less potent because courts are not conscious that they are swayed by it. The most important branch of the court consists of persons drawn direct from the body of the people. The jury brings to the trial of a case popular thought and feeling. Jurors are called as men to sit as judges, nothing separates them from their former selves but the "juror's oath." A man's prejudices are a part of him, they cannot be sworn away. The oath honestly taken may be honestly broken. It furnishes no adequate security that the cause will be well and truly tried. Every

citizen is liable to be called as a juror, and thus his private judgment is permitted to give tone and color to the administration of law. It is not true,—except in theory,—that the jury determines only the facts of the case; the jury takes the law from the court but makes its own application, and, according to its understanding, fixes the remedy. About all the substantive-existence law has, is bound up in the remedy afforded for the infraction of legal rights. With the power thus vested in every citizen to himself become a lawmaker, there seems a new dignity added to the privilege of citizenship, and it behooves every one to have a care as to how he forms his private judgment.

In determining questions of public concern, men turn instinctively to the expounders of law for enlightenment; they hang upon the lips of jurists, and receive all their first impressions from their words. They look for a simple explanation, and are given, not infrequently, a jargon of technicalities. More than one unhealthy public sentiment is traceable to some misinterpreted rule of law; not a few of the prevailing popular prejudices are based upon some false theory of the law.

At the bar of public opinion the rights of corporations are little regarded. The demagogue who can most skillfully cry down the "dangerous increase of corporate power" may hold the suffrages of the people in the hollow of his hand. Few men stop to inquire the merits of a controversy, after they learn that a corporation is on one side and a private individual on the other. At the bar of justice corporations are reduced to the same unenviable condition; it has passed into proverb that their rights there are as often nominal as real. In cases wherein a corporation is a party, a verdict followed by a judgment is recorded against it, regardless of the merits of the controversy, in substantially every instance. In the Circuit Court of Cook County, Illinois, in *Rubins Ad'mr. v. The Abbott Buggy Company*,—a case for damages for personal injury,—a juror was objected to and excused because in his capacity as bank-teller, he knew the defendant always met its commercial paper promptly. This was a repetition of the common practice every lawyer is familiar with. Unless a juror seems actually prejudiced against corporations, he is not accepted. It

is the scope of this article to consider the relation of this prevailing prejudice to the general principles of Corporation Law.

The popular conception of corporations, so far as it is capable of analysis, may be fairly stated thus:—They are regarded as a sort of abnormal growth,—sapping the strength of the body politic,—unsusceptible of exact classification. They are believed to have transcendent powers for the acquisition of wealth, which powers are not enjoyed by ordinary citizens, and to be endowed with the privileges and capacities of natural persons without being subject to corresponding responsibilities. Their very name is suggestive of monopoly, their material prosperity is attributed to some fostering care of the State. Righteous indignation taking the form of patriotism in the mind, is the natural consequence of such a belief. The conscientious man whose thoughts are colored by it, conceives it his highest duty to check the ravages of these monsters. An occasional vote, an occasional call to sit upon a jury, are his only opportunities for exercising this high function. The influence of the demagogue and the abnormal verdict are thus alike easily accounted for.

A corporation has by the courts been variously defined as:—"An artificial body of men." (1) "An artificial being invisible, intangible, and existing only in contemplation of law": endowed with "immortality" and "individuality." (2) "An artificial person." (3) A body corporate—an incorporeal hereditament possessed of neither body nor soul—a legal entity—separate and apart from the members who compose it. (4) "A franchise possessed by natural persons." (5) It is said to have "privileges, immunities, and capacities not enjoyed by its members as natural persons," (6) to be capable of acquiring rights arising *ex contractu*, and not to be amenable for its crimes.

An artificial body of men is either an abnormal growth unsusceptible of classification, or an absurdity. A franchise is a monopoly, or, at least, a chief element of monopoly. A being having *privileges not enjoyed by its members as natural persons*, seems to possess transcendent powers; and an artificial person vested with the power of making contracts, yet exempt from the criminal jurisdiction of the State, appears to be endowed with the attributes of natural persons without being subject to corresponding responsibilities. Considering the light that has been given them, the people have judged with marvelous accuracy.

It will be urged that the language of the law is technical, and when rightly understood cannot be

given such interpretation. The unprofessional mind always understands language in its ordinary meaning, but, aside from this significant fact, it is the settled doctrine of the law sustained by an almost unbroken line of precedent, that a corporation is an artificial person possessed of privileges and immunities not enjoyed by its members as natural persons; that it may enforce its rights arising out of contracts, and is not punishable for its criminal offenses.

Amid all the confusion which this doctrine has engendered, among all the qualifications of it which Courts have felt called upon to make, this central idea of artificial personage and separate legal entity has been the controlling and animating principle of the law of corporations from the beginning. The people have caught the idea in their capacity as jurors, and from the stump, and have wrested it, if not to their destruction, at least to the promotion of an antagonism on the part of persons engaged in corporate enterprises, quite as effective and more dangerous than their own.

Could New York startle the nation by revelations of the Broadway Surface Railway steal, if men did not feel greater security in carrying on their nefarious practices through a corporate organization, and beneath the cloak and shield of a corporate entity? Would the Chicago City Railway Company find it necessary to resort to jury-bribing in trials of civil actions for damages for personal injury, if corporations had at all times received fair treatment from the Courts? No amount of abuse justifies crime,—if crime in either of the above instances was committed,—but the prevailing prejudice against corporations may, in a large measure, account for it.

Jurists might claim exemption from responsibility for this condition if there were any necessity for the rules of law which gave rise to it, or rather, upon which it is based.

It may be doubted if, in any proper sense, that which is the product of *art* can be called a person. According to Webster, a person is "a corporeal manifestation of the soul"—"a self-conscious being"—"a moral agent"—"especially a living human being"—"a man, woman, or child"—"an individual of the human race." Given neither *body* nor *soul*, a corporation cannot be a corporeal manifestation of soul. Deprived of every attribute of personality it cannot be a person in that sense. Or, psychologically considered, "a person is an individual that, like man, possesses intelligent volition." It is impossible to attribute "intelligent volition" to anything outside of the animal kingdom. Certainly no mere mental creation, such as an "artificial person," can be considered as of itself having "intelligent volition." It is, indeed, impossible to conceive an "artificial person," independent of the persons or members who compose it. It is a

misnomer to speak of a corporate *will* other than as referring to the joint or collective *will* of the persons composing the corporate body.

Technically, the appellation is derived from the civil law. To that jurisprudence we look for the origin of our law of corporations. By the civil law "whoever or whatever was capable of having or acquiring rights was a *persona*," (7) and a corporation was by that jurisprudence considered as capable of having and acquiring rights. In reality there was no ground for such assumption.

(To be concluded.)

#### BODY AND MIND; OR, THE DATA OF MORAL PHYSIOLOGY.\*

BY FELIX L. OSWALD, M.D.

Part XVII.

#### HEALTH AND DISEASE.

The first discoverers of the fossil remains that attest the former existence of gigantic reptiles and mammals must have been tempted to an inference rather at variance with the doctrine of evolution from lower to higher forms of life. The evidence of indisputable inferiority in the size and strength of living creatures as compared with their extinct congeners, encouraged those theories of biological retrogression expressed in the classic traditions of the Saturnian Age and the paradise legends of the Semitic nations.

The systematic study of comparative anatomy revealed, however, a steady progress in the direction of higher organization, in the sense of structural adaptation to more efficient and more versatile functions. In other words, the living organisms of the present age, though inferior in bulk and rude strength to the giants of the earlier geological periods, exceed them in the elaborate complexity and pliancy of their structure, and thus, after all, demonstrate a progressive adaptation to higher functions of life.

The progress of moral evolution presents a strikingly similar contrast. Our moral and mental life is more complex, more elaborate and diversified than that of the ancients, but those advantages are offset by a loss of vigor and moral stamina. In many respects the moral contrast of ancient and modern times corresponds, indeed, to the contrasting moral concomitants of rugged health and debility. Physical and moral changes of that sort go hand in hand, and there is no reasonable doubt that, as compared with the heroic age of the Mediterranean Republics, ours is an age of physical enervation. The comparatively recent revival of sanitary science has somewhat increased the average of human longevity that reached its lowest ebb during the reign of mediæval anti-naturalism; but

it would be in vain to deny that in the course of the last thirty centuries the average duration of human life has considerably decreased. The genealogy of Hebrew and Hindoo patriarchs may be founded on a lower unit in the computation of time; the "years" of Genesis may have been moons or seasons, and the records of Brahmin scripture may have been vitiated by the myth-making tendency of Oriental historians. But the statistic chronicles of Greece and Rome cannot thus be explained away. Biographers writing of contemporary statesmen and philosophers in an era of systematic chronology can hardly be supposed to have exaggerated their age by scores of years. In the first century of our chronological era (A. D. 74) the Emperor Vespasian ordered the publication of statistics comprising the following census-records of the eight administrative divisions of the Roman Empire: Fifty-four of the total population (inhabiting the most prosperous regions of Europe, western Asia, and northern Africa) had attained, but not passed, their hundredth year; one hundred and fourteen were between 100 and 110 years of age; two only were between 110 and 125; four between 125 and 130; four others between 130-135; three between 135-140. The latter age was undoubtedly exceeded by that of Thomas Parr, an English peasant of the eighteenth century who died at the age of 152, and whose three grand-sons outlived a century by several years, thus removing all physiological objections to the approximate correctness of the Roman census. That margin of doubt is, however, still further limited in the case of well-known statesmen, poets, and men of science. The poet Epimenides, according to Pliny, died at 154; Democritus, at 109; Gorgias of Lacontes, at 108; the philosopher Theophrastus, at 107. Three of the "seven wise men" of Greece, according to Lucian, lived more than a hundred years. The historian Hieronymus of Rhodes died at 104. The comic poet Cratinus at 100; Hippocrates, the founder of hygiene at 99; Galen at 98. The poet Isocrates and the Cretan philosopher Demonax died in their ninety-ninth year, not of old age, but of excitement the one, the other of hunger. The Stoic Cleanthes and the satirist Juvenal lived a few days more than a hundred years. Perennius Tutus died (A. D. 117) in his 107th year; Fabius Maximus in his 101st; Terentius Varro in his 98th.

Nor can we possibly doubt that our so-called prodigies of physical strength would have been children in the hands of the ancient athletes. Not to mention the portents recorded of Milo and the champions of the Olympic arena, the sober military statistics of Xenophon and Pliny oblige us to admit that the warriors of the old Mediterranean Republics were habitually subjected to hardships and fatigues that would kill ninety-nine of a hundred modern soldiers in a single week.

\* Copyrighted.

In view of such facts the contrast in the moral types of ancient and modern nations implies a suggestive physiological significance. Physical debility effeminates, and the moral characteristics of Pagan heroism differs from those of modern culture as the masculine differs from the feminine type of vices and virtues. Ferocious passions have yielded to pity, extravagance to moderation, pride to the worship, if not to the practice, of humility; but also patriotism to the culture of the domestic virtues, the love of blunt truth to hypocrisy, the cruelty of callousness to the cruelty of vindictive spite, moral courage to moral cowardice. The most characteristic difference in the moral concomitants of health and disease expresses at the same time the most significant contrast in the moral tendencies of ancient and modern religions: The worship of joy was superseded by a worship of sorrow.

The main tendency of the creed that developed its deepest roots in the soil of a decaying empire, is a distinctive symptom of disease. The joy of revelry jars upon the ear of the sick; decrepitude naturally turns its hopes from the tribulations of life to the peace of the grave. "Under the influence of sorrow and infirmity," says a reviewer of mediæval ethics, "men are apt to become instinctive pessimists. Nature practices her delusions for wise purposes of her own. She baits her matrimonial traps with visions of Elysium and reconciles her children to the gathering shadows of the long night by exaggerating the disappointments of the day and the recollection of its fatigues. And, even at the end of a pleasant evening, rest becomes sweet enough to be valued for its own sake. But this quietude of the sunset hour the apostle of renunciation attempts to enforce in the morning of life; his disciples are to seek refuge in sleep before their days' work is done; he gathers dry leaves to bury the budding flower. Like the genius of death, he depreciates life by dwelling upon the vanity of its hopes; and the secret of his success is to be found in the circumstance that in every human breast there is a germ of this feeling which may be stimulated into premature activity. It is a reversion of the vital instincts. Even in the prime of life, the systematic suppression of all our natural desires will lead to that weariness of earth which Nature had intended to deaden the sorrow of the parting hour, as we may force a plant to return as dust to dust by depriving it of its flowers and green leaves. Young pessimists resemble the fruits that rot before they ripen. Monastic tendencies imply an abnormal condition of the human mind.... Disease, crushing misfortune, mental derangement, whatever disqualifies a man for the healthy business of life, will qualify him for the reception of anti-natural dogmas. Marasmus and pessimism are as concomitant as optimism and health. Caged murderers generally become

devout: Nearly every scaffold orator edifies his audience by the enunciation of unworldly sentiments. Unmasked hypocrites console themselves with the hope of a better hereafter. When the gods of war rejected his appeal, Charles IV of Spain solaced his spirit by embroidering a petticoat for the Holy Virgin. Rancé, the founder of the new Trappists, became devout in consequence of a domestic tragedy; the quietism of Raimund Lullius dates from the infidelity of his bride; Hannah More was a martyr to chronic headaches and Calvin a dyspeptic. The devotees of pessimism were mostly persons who had reason to revenge themselves upon Nature....

—The Devil was sick, the Devil a monk would be.

or, to quote the famous sarcasm of Marquis Condorcet: "Impotence insists upon the sinfulness of earthly amours."

The disease-born doctrine of renunciation has, indeed, darkened the sunlight of earth as efficiently as disease itself; but the ethics of decrepitude assume their compensating form in the worship of pity. "He sneers at scars who never felt a wound;" and only the children of sorrow can fully sympathize with the affections of their brethren. "The bright gods of Olympus," says Heinrich Heine,—"gods whose eyes had shed no tears, were unable to realize the woes of poor martyred man, and man's burdened heart could hope no solace from his prayers. They were holiday-gods to whom their worshipers could dedicate only banquets and thanks. They were never truly loved. Truest love is the privilege of sorrow: Pity is its sacred seal; pity, perhaps, is love itself. Of all gods who were ever loved, Christ, therefore has been loved the most...."

And pity has remained the redeeming trait of fallen nations. The Sicilians, the starving Spaniards, the Poles in their deep sorrow and misery, are passionately charitable. Times of distress stimulate the devotion of self-sacrifice;—the age of Inquisitorial torture-hells coincided with the period of noblest charity, and the dogma whose fanatics Jordan Bruno justly stigmatized as the worst enemies of mankind, has also produced the most zealous philanthropists. Priests, with all their "sectarian animosities and horrible persecutions," as Lecky sums up the infamies of ecclesiastical history, with all their "blind hatred of progress, their ungenerous support of every galling disqualification and restraint, their intense class selfishness, their obstinately protracted defense of intellectual and political superstitions, their childish but whimsically ferocious quarrels about minute dogmatic distinctions, dresses and candlesticks," were nevertheless the deathbed-angels of a hundred sorrowful generations and foremost ministers of mercy in the crisis of every public calamity.

"A cripple makes the swiftest sick-nurse," is a well-

founded proverb of French military hospitals,—as well-founded as the proverbial cruelty of thoughtless boys who cannot realize the significance of the tortures they inflict on helpless birds and kittens. The "fellow-feeling of joy," evinced by those same boys in their keen sympathy with the happiness of their playmates, contrasts, however, not less strongly with the narrow envy fretting the souls of their pious elders, and forms the analogue of another characteristic distinction of ancient and modern ethics. The philanthropists of antiquity delighted in sharing and increasing the joys of the happy. The philanthropists of the cross confine themselves to sharing and decreasing the sorrows of the afflicted. It would be no exaggeration to say that the Emperor Trajan alone expended more treasures on the maintenance of free public recreations than all the sovereign rulers of Christian Europe have expended in the course of the last hundred years. Every larger city of southern Europe and western Asia had a free arena and a free public bath; jugglers, musicians, athletes, and zoological curiosities were imported from foreign lands, regardless of expense; every new month was ushered in by a day of merry-making in honor of a tutelary god; the patricians, the plebeians, and even the slaves of ancient Rome had their yearly festivals, besides the great national and municipal anniversaries that united the pleasure-seekers of all classes. The Colosseum of Vespasian seated eighty thousand spectators, but was rivalled by the amphitheatres of Syracuse, Narbonne, Antioch, Berytus, and Thessalonica. Christian potentates celebrate their accession by remitting or mitigating the sentence of a few political prisoners. Roman victors signalized their triumphs by treating their countrymen to a series of free festivals. When the philosopher Anaxagoras lay on his deathbed he did not try to perpetuate his memory by endowing a mythological seminary or a hospital for orthodox consumptives, but requested the magistrate of his native town to celebrate the anniversary of his death by treating their schoolboys to a yearly holiday.

Yet it must be admitted that even in the centers of pagan civilization that "fellow-feeling of joy" was offset by an extreme, often, indeed, almost incredible callousness to the appeals of mercy. Seneca, the most humane of pagan philosophers, distinctly insists (*De Clementia*, II, 6, 7) that the leniency of a judge should stop short of duty, and that the commiseration of suffering is suited only for weak women and men of unsound mind! "It is only diseased eyes," he says, "that weep in seeing the fear of others, a foible akin to the nervous weakness that makes some people laugh when others are laughing aloud." Such teachings bore their print in the law that doomed to a cruel death all the slaves of a murdered master whose

assassin could not be discovered—a law which in the time of Tacitus was actually enforced upon the four hundred slaves of a Roman Knight, found dead under circumstances which did not even exclude the possibility of suicide. As late as the reign of Hadrian husbands killed their wives and fathers their sons with general impunity, and only in a case of exceptional atrocity a citizen of Rome was banished for murdering his own child. The elder Cato seems to have treated his slaves as the modern Turks their stage-coach horses, that are driven to a speedy death by systematic over-work and underfeeding to save the expense of maintaining them in old age. The insurrection of Spartacus was quelled by crucifying several thousand captives. Slaves performing the duty of porters, were often chained to a gate, like dogs, and prisoners of war, by thousand and tens of thousands, were sold to the man-butchers of the circus arena, where in the rehearsals of a holiday-show scores of the helpless wretches were often slaughtered for the mere purpose of instructing novices in the details of scientific homicide.

It is a suggestive fact that cruelties of that sort proved for centuries compatible with an advanced state of intellectual and artistic culture, and in some of their most barbarous forms were sanctioned, not only by despots, crazed with wine and lust, but by enlightened statesmen, and with rare exceptions, even by the exemplars of those schools of philosophy whose moral precepts excelled the teachings of the traditional religion.

That fact would, however, appear less strange, if we were less apt to confound the primary and secondary instincts of the human mind. The moral results of education, in the course of time, tend to become hereditary, and at last require the force of a "second nature," swaying the mind with all the spontaneous impulse of a natural propensity. The love of "romantic scenery," for instance,—of lofty mountains, steep rocks, and yawning precipices, has become an intuitive passion of the educated classes, but frequently fails to strike a responsive chord in the soul of rustics and seems to have been almost unknown to the ancients who shuddered at the sight of frozen Caucasus and viewed with indifference, if not with dismay, the grandest prospects of the western Alps, whose snow-clad ramparts they mentioned only as so many obstacles to the progress of their military expeditions. Again, the doctrine of eternal punishment, thanks to the ceaseless efforts of the mediæval priesthood, has become almost indelibly impressed upon the minds of millions who anticipate the hour of death with a dread which the mere prospective end of conscious existence would fail to inspire. But that dogma which a historian of moral

evolution characterizes as at once "so atrocious, and so extravagantly absurd that its adoption might well lead us to doubt the universality of moral perceptions," found only a faint analogue in the mythology of Hesiod (the doom of Tantalus and the Danaids, for instance) and is hardly ever mentioned in the pagan literature of the next fourteen centuries.

Altruism, in its more sensitive forms, was equally unknown to nations of undoubted mental and physical health, though it is now so fast acquiring the force of an hereditary instinct that many of our contemporaries find it difficult to realize the attraction of the gladiatorial games (except upon the theory of a moral disorder), and are apt to forget the complacency of the Spanish cavaliers, who only three hundred years ago engaged reserved seats for their boon-companions and gaily-dressed ladies, to witness the agony of a roasted heretic.

#### FORM AND FORMAL THOUGHT.

##### II.

##### THE ORIGIN OF THE 'A PRIORI.'

Kant answers the question 'How are synthetic judgments a priori possible?' by showing that such synthetic judgments undoubtedly exist.

A synthetic judgment is different from an analytic judgment. An analytic judgment merely analyses knowledge and contains nothing but an explanation or elucidation of what, in an involved form, we have known before, but a synthetic judgment really amplifies our knowledge; it adds to the stock of our knowledge something new, which we have not known before. In proving that the exterior angle of a triangle is equal to the sum of the two opposite interior angles of the same, we amplify our knowledge of the triangle by mere ratiocination, a priori. Kant uses even a simpler instance. The judgment  $7 + 5 = 12$  is not analytic but synthetic. The concept twelve is neither contained in seven nor in five, but is something entirely new.

Kant leaves the subject here and is satisfied with the fact that synthetic judgments a priori are possible. He might have ventured a step further by proposing another question: 'What is the origin of the a priori?' Only by answering this question could he have shown, *how* synthetic judgments a priori are possible. This he did not do, and the omission has produced great confusion among German, French, and English thinkers.

The word 'a priori' is undoubtedly an old-fashioned and awkward expression, which has not yet lost the savor of 'innate ideas.' It was readily accepted in England by philosophers of a theological bias who were little aware of the dangerous properties concealed in this Kantian idea. It sounds so scholarly Latin, almost ecclesiastical; for it is an expression handed

down from mediæval times. But when they drew this clumsy wooden horse within the walls of their dogmatic stronghold, they unwittingly admitted an army of bellicose warriors—Kant's critical thoughts—who are sure to conquer and destroy the citadel of dualistic orthodoxy.

"The old fashioned a priori in science, in morals, and religion," a reviewer in *Science*\* somewhere remarks "used to be represented as an arrogant and intolerant thing, mysterious in its manner of speech, violent and dogmatic in the defense of its own claims. The English Empiricists used to hate this aristocratic a priori and they shrewdly suspected it to be a humbug. What they gave us in its place, however, was a vague and unphilosophic doctrine of science that you could only seem to understand so long as you did not examine into its meaning." J. S. Mill's philosophy moved in a circle. "He had founded all inductive interpretation of nature on the causal principle and the causal principle again on an inductive interpretation of nature."

Kant, as we have stated, calls the a priori truths 'formal knowledge,' and this indicates that the general postulates of the transcendental sciences, the axiomatic conceptions from which they start, are abstracted from reality by thinking away, as it were, their material existence, which is represented in our sensory impressions. Kant suggests this conception of the a priori, but he nowhere pronounces it. On the contrary, he makes statements which may be taken to exclude this interpretation of his conception.

According to our view, form is a property of reality as well as of our cognition. Formless matter does not exist. Form and matter, as they exist in reality, are inseparable. What is called formless matter is either uniform or lacking that kind of form which, in our opinion or according to our wishes, it should have. Knowledge also in its primitive shape, when it is, so to say, natural and crude, is an intimate combination of sense-perceptions and formal cognition. The sense-perceptions are the real substance of knowledge, while formal cognition is the principle which arranges and systematizes sense-experience.

As soon as a living being develops the ability to think *in abstracto*, a state which is attained by means of language, he can think of different qualities independent of things. He can think of whiteness, of greatness, of smallness, of courage, and of cowardice. And soon after that, he will be also able to think one, two, three, four, five units *in abstracto* without the assistance of his fingers; he will count. Counting is a most important step in the development of humanity, for it is the first purely formal thought. It abstracts from the objects counted and refers exclusively to the

\* *Science*. Vol. V, p. 202.

unit numbers which then may be employed for any kind of things.

Physiologically considered the growth of abstract and formal ideas must have developed in the following way:

Irritations in the amoeba can only produce vague feelings. Light and darkness, heat and cold, moisture and aridity, abundance and scarcity of food, exercise a certain influence upon the animalcule; they act upon it in a certain way and produce more or less favorable or unfavorable effects in the living substance which may ultimately result in reactions of some kind. In higher animals irritations are reacted upon differently in different organs. Sensitiveness has been differentiated, and a ray of light is perceived on the nerves of the skin as warmth and in those of the eye as light.

The same process of differentiation and specialization takes place in the brain. If a horse is seen, its image appears on the retina of the eye, whence the irritation is transmitted through the optic nerve to the interior parts of the brain. There it is perceived as a horse. According to Hering\* and other physiologists, there is no doubt but that every new perception of a horse is registered on the same spot in the brain as previously. Every single brain-cell has a memory of its own, which makes it more fit to be irritated by that perception to which it has adapted itself. Thus, the conception of a horse is the sum total of all percepts of a horse. It is, as Mr. Hegeler† most appropriately expresses it, like a composite photograph. The common features of a certain group of same things are preserved, while the individual traits become blurred and are lost sight of.

Thus the many varying images of the eye, and all sensory impressions, as well as motory exertions, are registered somewhere in the brain, each kind in its place. The special memory of the different fibres and cells naturally arranges all percepts and concepts in a proper order. Moreover, a repeated simultaneousness of different sensations which are produced by same causes in different sense-organs, produces associations between certain percepts. We think of the rose and at the same time of its smell and its color. We see a bird and think of his song, and the dog who sees the whip feels at once in his recollection the pain caused by his lash.

\*See Ewald Hering; Memory as a General Function of Organized Matter. THE OPEN COURT, p. 14.

† Mr. E. C. Hegeler, in his essay, "The Soul," (see THE OPEN COURT, p. 393) says:

"If an abstraction is made, many things having something in common are put together, and what they have in common is specified in words. It is then forgotten that what they do not have in common disappears in the generalization. The same takes place in Galton's composite photographs of the members of a family. Only that remains of the several faces what they have in common. This implies that the composite photograph is entirely contained in each of the single photographs of each member, each is the complete composite with additions. So in reality the composite photograph is an abstraction—a part—of each of the single photographs."

Horses have been perceived which are different in size, and color, and temper, etc. These differences are occasionally of importance. A horse may attract attention because it is as white as snow. The horse is perceived and also its whiteness. Thus a new concept is created, the concept of a quality which does not correspond to, but has been abstracted from, concrete objects. White roses, white snow, white stones (as lime or chalk), and white horses have been perceived, and the percept of 'whiteness' is produced, to which again a special province of the brain must be ascribed, which of course must be connected by nerve fibres with all white things, more so with things that are always white than with those that appear so only occasionally. The psychical connection of such concepts is called association.

Suppose we are in a library where the books are well arranged by a number of librarians who have different but each one his own special interests. Many books are being constantly delivered. There are books about horses, and dogs, and flowers, and stones, etc., etc. Every librarian takes the books of that subject with whose study he is specially engaged and places it in his alcove. The library would be in the best order, and yet so long as the different alcoves were not named, most of its treasures would be inaccessible for many most important purposes. Such is the arrangement in animal brains. A dog knows what a cat is. Every new perception of a cat awakens in his mind with more or less vividness all the many previous percepts of a cat with their different associations, mostly memories of pursuit, perhaps also of resistance and combat. But all these memories are single percepts. They have not yet coalesced into a unitary and clear conception of catdom. If the sum total of the cat-percepts in his memory is to be called a conception, it is certainly a very imperfect kind of conception. A conception becomes distinct only by being named. This is the truth which has been so splendidly elucidated by our best philological authorities, namely, that thought (the abstract thought of reasonable beings) is only possible by the help of language. Man thinks because he speaks. The name of a thing is, as it were, a string tied around all the many percepts of that thing, thus comprehending them all in one concept. Concept is derived from *con* and *capio* and means, according to its etymology, a taking or grasping together, a gathering into and holding in one.

The act of naming is therefore an enormous economy in mental activity; it is the mechanical means by which abstract ideas or generalizations are formed; and the faculty of thinking *in abstracto* is called reason. Reason, therefore, in its elementary origin, is abstracting and combining. Abstracting is

a kind of separation. We separate the quality of white from white objects and combine all the different white-sensations into one concept by the name of 'whiteness.' Both processes, that of separation and of combination, are essential features of reason; but they are the essential features, and all functions of reason can be reduced to these two processes.\*

Our brain is like a workshop in full and unceasing activity. In its operation, we must distinguish three things:

1. The activity which is called life; it is a special kind of energy. Its presence makes itself felt as motion, which is a change of place and could be, if all details were known, mechanically expressed.

2. The material of which the whole workshop of the brain consists, and which is used to keep it in working order; viz., the matter which is constantly combining and decomposing in the protoplasm of the brain-substance.

3. The form in which life operates in the nervous substance. Every brain-cell has a special form, the groups of cells are arranged in special forms and the whole system of the different cerebral organs is built up in a special form.

We distinguish these three things, but in reality they are inseparably united. If our percepts and concepts are to be physically considered, they should not be represented as the activity only of the brain, nor as brain-substance, nor as their mere form. They are activity, and matter, and form united; being a special form of the activity in brain-substance. It goes without saying that the form of a special energy depends upon the form of that substance in which the process takes place. The form of a motion and the form of the substance in which the motion takes place, are not only interdependent, they are identical.

A certain percept, being a special form of motion in living brain substance, leaves in those cells in which it takes place, such vestiges as to produce a disposition adapted not only to receive the same or similar percepts, but even to reproduce that percept spontaneously, if the cells, nourished by the blood-circulation, are stimulated into activity through some inner process by association. This disposition (called by Hering *Stimmung*, which is produced by the special mem-

ory of organized matter), becomes stronger by repetition and thus imparts more and more stability to that special form.

Physiologically considered, percepts and concepts are very complicated structures which in their associations may resemble a kind of three-dimensional network, showing interlacings of innumerable star-shaped knots, the threads of which interradiate and combine the various sensory percepts belonging to the same idea. But for the sake of simplicity let us suppose that perceptions and conceptions grew in a brain like cells and groups of cells simply; they would naturally and mechanically arrange themselves in systematic order. One of the first steps in the evolution of living matter is that of giving stability to its outer form by enveloping itself in a membrane. Form, as we understand the term, is not only the outside shape, but also the inner disposition and arrangement of atoms. However, for the sake of simplicity again, and as a matter of crude illustration, let us for a moment use the membranes of cells as an example of their forms. The membranes of cells are also organic substance and their material particles are constantly changing. Nevertheless, they possess a relative stability which represents the shape of the cells, i. e., their outer form. If we would take out of such a brain the living substance without destroying the membranes in which the cells have enveloped themselves, it would afford an aspect of divisions and subdivisions not unlike that of the departments, shelves, and pigeon holes of a library from which the books are removed, and we would have an anatomical representation of a system of formal thought.

It is understood that this explanation is a simile only to show that form grows *pari passu* with its substance, and mere form, if abstracted from its substance, is, for purposes of thought, by no means valueless; it is of greatest importance for a proper orientation among the enormous mass of sense-perceptions that crowd upon the mind.

An animal and a man may have the very same sensory impressions; their brain substance consists of the same combinations of nervous matter; sensations (the basis of all mental activity) are produced by the same kind of organs and in the same way. Yet there is a difference of form between the animal and the human brain in so far as the many different impressions of same percepts have not yet attained in the animal brain that stability and unity which they possess in the human brain. In the human brain the subdivisions are more marked, the furrows are deeper as well as more numerous; and from recent investigations we know that every class of same perceptions has acquired an additional and closely associated brain

\*F. Max Müller defines Reason as "addition and subtraction." We have repeatedly given our full assent to the great philologist's views with the remark, that we should substitute for "addition and subtraction" the terms used above, i. e., "combination and separation." The terms "addition and subtraction" are confined to arithmetic; and to our mind they are different from "combination and separation" in so far as "subtraction" is used of units that are taken away from other equal units, while "separation" takes a part from something that appeared as a unit (an integral whole) before the separation. Similarly an addition sums up units of the same kind (or at least those which for the purpose of addition are considered as being of the same kind) into a larger number, while a combination unites parts into one consolidated whole. We believe that there is no substantial difference between Prof. Max Müller's view and our own.

structure which embodies its name.\* The whole group of certain percepts together with their name represents what in logical and psychological language is called a concept.

Let us now suppose that the chief librarian of the library of our brains for the sake of arranging a catalogue takes an inventory of all the books arranged in the different alcoves. He would find the same principle of arrangement applied everywhere. The different alcoves would have separate departments and these again would be found to possess subdivisions. This kind of arrangement, which, as we stated above, grew naturally, became first apparent when the process of naming took place. Many different names were conceived in our consciousness to be special kinds of one general kind so that they together formed one system of ideas. Logicians call it *genera and species*.

The librarian (we now suppose) arranges an office (perhaps for the purpose of reference) in which a general plan of the whole library can be found. This reference room contains no books. The visitor finds there no substantial information; the information to be gained there is purely formal and serves the purpose to find one's way easier in the many different departments of the alcoves. This reference room in our brain is called logical ability, or mathematical reasoning, or calculation, and we need not say that its establishment marks another important step in the development of reason; it is formal thought. It is the beginning of scientific thought by the help of which we gain information about the methodical arrangement of our conceptions. Logic does not create order and system in our brain, but it makes us conscious of the order that naturally grew in our mind.

The difference between the library and our mind is, that in a library the shelves have been put up before the books were stored, but in our brains the different notions form (or rather grow) their own categories. The notions of our minds are like living books that build their own shelves and pigeon-holes, similar to the way in which cellulizing protoplasm covers itself spontaneously with a membrane. If we abstract from the protoplasm, which constitutes the contents of cells, we retain the empty membranes, and if we abstract from the sensory material of percepts and concepts, we retain their mere forms, which, reduced to rule, are called formal thought, *i. e.*, arithmetic, mathematics, mechanics, and logic.

Knowledge of objects has been gained by sensory impressions, but knowledge of logic can be acquired

only by a process of self-observation. It is a kind of internal experience which is quite different from that of external experience; the latter takes place by, and can never dispense with, the instrumentality of the senses. If the rules of pure logic are to be established, we must carefully exclude from this process of inner self-contemplation the interference of the senses, for it is only the form of things, and thoughts, and motions, with which in purely formal thought we are concerned. The importance of these forms becomes at once apparent if we bear in mind that as they are in one case they must be in all others also. The rules by which we generalize our knowledge of formal conditions (of mathematics, arithmetic, logic and mechanics) possess universality and necessity.

The process of scientific enquiry will be seen to be everywhere the same. Science classifies sensory experience according to the categories of formal thought. In so far as we succeed in reducing the data of a certain subject to mechanical, mathematical, arithmetical, or logical principles, we solve its problems and recognize why the different phenomena which are subject to our special enquiry *must* be such as they are. Science traces necessity everywhere; and science can do so only by the help of the formal truths, which, holding good for all imaginable cases, show single instances under the aspect of universal and irrefragable rules.

P. C.

#### NATURAL AND ARTIFICIAL PERSONS.

The most recent investigations of physiological psychology have not only revolutionized our views of the human and animal soul, but have also exercised a great influence upon the other sciences that are more or less dependent upon psychology,—first among them, history and jurisprudence. A new science is about to be born, which, by German savants has occasionally been called *Volkspsychologie*. It will investigate the laws of national soul-life from the standpoint of positivism. The data of the psychical life of a number of individuals are their actions, their customs, their habits, and their laws, in their totality as well as severally. A number of individuals will naturally form a unity, as do tribes and nomadic families. In their further development they will organize with purposive foresight into States and Empires. They thus form nation-individuals of a special character and with peculiar features.

Nations, Cities, States, and Empires are, so to speak, *natural* individualities which coalesce from the common interests of individuals of the same race, or the same language, or the same residence, or the same religion, perhaps of all four. But there are also individualities which are created by a union of several people who have the same commercial, professional, or industrial interests. They originate in the same way and according to the same natural laws as States and other natural individualities of a corporate character do; but as they cannot spring into existence without the conscious consent of their members, nor without adopting, in some way, a system of by-laws or an agreement of some kind, they have, so to say, an *artificial* existence. Since such companies, or guilds, or associations, are recognized as corporations by the State, they are called artificial persons.

An individual is such a unity as, if separated into its parts, ceases to be what it has been before the separation. An individual

\* Compare the map and explanations of the human brain in *Der Mensch*, by Dr. Johannes Ranke, Vol. I, p. 530 et seq. The chapter, " *Lokalisation in der Grauen Gehirnrinde*," explains Broca's, Hitzig's, and Fritsch's investigations. It takes into consideration the arguments proposed by adversaries of the localization theory (Goltz, etc.), and adopts Exner's view which, it appears, reconciles seemingly irreconcilable principles.

in order to remain what it is, is, as the name suggests, indivisible. An octahedral, or any other, crystal is an individual. If broken, it ceases to be what it has been. An animal, say an ox, is an individual; if cut to pieces, it is no longer an ox, but pieces of beef. An artificial person so called is an individual; if its members, from insolvency or from a disagreement of any form, dissolve, it ceases to exist; its transactions stop, and its business is no longer carried on. A 'person' is an individual that, like man, possesses intelligent, volition.

Living individuals do not remain one and the same; they grow or decline and are more or less in a state of constant change. A man's body is in a constant flux: new matter is received, old matter is given out; new ideas are accepted, old ones are discarded, or obliterated. Similarly a corporation may change its members and yet remain the same corporation, carrying on the same business and not losing its historical connection nor suffering an interruption of its transactions during the process.

Some animals of a lower order have a tenacious life. They may be cut in two, and both parts may continue to live and grow to be individuals like their parents. In a similar way corporations may split, and by establish themselves as two competitive companies of the same kind, as the parent corporation had been.

The juridical views that have been entertained about artificial persons have been very vague—perhaps just as vague as those about human persons. Juridical authorities have used similar words even for their artificial persons as theologians have when speaking of the human soul. It appeared as an immortal, an intangible, and an invisible entity of a very mysterious character.

The object of science is to remove mysteries. Positive psychology, history, and jurisprudence have rid themselves of the mysterious, and the results of all these sciences, pointing out the same facts of psychic life in different provinces, will help to explain each other. They show how by natural or artificial combinations and organizations more complicated, more powerful, or higher individuals, can be produced. The individuals produced are neither invisible psychic entities who exist of themselves like ghosts and spirits, nor are they a mere fiction of idle brains; but they are the product of the joint action of their several members or constituent parts; they are new formations of a real, and sometimes most important, existence. Their characters are determined not only by their constituent elements but also by the purposes for which and the forms in which they combine.

## CORRESPONDENCE.

PROF. W. D. GUNNING AND "THE OPEN COURT."  
To the Editor of "The Religio-Philosophical Journal," Chicago.

I have read in your journal, of November 10th, a communication from Mr. Underwood touching a line from me to THE OPEN COURT, and a line of earlier date to himself. His points are correct so far as he had information. It is certain that, had he remained editor of THE OPEN COURT, the Montgomery-Cope paper would have been written, as at that time my husband was writing quite regularly for it. It had been fully matured, but before it was committed to manuscript the editorial rupture had occurred, followed by Mr. Underwood's circular to his friends. This calamity disturbed Prof. Gunning, and he dropped the work for a time. He had not been so situated as to have any personal knowledge of Mr. Hegeler or of Dr. Carus, the incoming editor, and feared as others did that it was all up with THE OPEN COURT. Conciliation as well as justice was in the temper of his mind. He was loyal to his friends, foremost among whom he reckoned Mr. and Mrs. Underwood. But he did not fail to do justice to the claims of the founder of THE OPEN COURT, in whose cause he had enlisted by becoming a paid contributor to it. To the existence of that jour-

nal, his friends owe the publication of his ripest thought, save that on the Montgomery-Cope discussion. The thought was too broad and too earnest to be desired in any other journal now issued. He sympathized with Mr. Underwood in his trouble, but he also recognized the free hand and mind that made the publication of THE OPEN COURT possible. It is therefore also true, that but for the sudden decline the article would have been completed for THE OPEN COURT, in whose columns the discussion appeared. It was spoken of by him on the morning of the day of his departure and there was deep regret that it was to be left incomplete.

The letter of March 14th did not touch on this phase for obvious reasons. Mr. Underwood was not then, and is not now ready to hear anything adverse to his attitude toward THE OPEN COURT, which is marked in his communication to your journal and in other ways. A ripe experience will not bear him out in it. It has marred the happiness of his friends—is destructive in spirit, and cures nothing. \* \* \* \* \*

Yours Very Sincerely,

MARY GUNNING.

GREELEY, COL., Nov. 14, 1888.

[Mrs. Mary Gunning, in a letter to the proprietor and editor of THE OPEN COURT, published in No. 61, wrote as follows: "There was a paper which, had Professor Gunning continued with us, he would have given you in due time. It was the treatment, or rather reconciliation, of the differences in the arguments of Dr. Montgomery and Prof. Cope as published in THE OPEN COURT." With reference to this statement the late editor of THE OPEN COURT has published in the *Religio-Philosophical Journal*, a spiritualistic paper of Chicago, a passage from a letter of Mrs. Gunning's to himself to the effect that if he had remained editor the article would have been completed and published. As the two statements appeared to him contradictory, Mr. Underwood considered "a correction" necessary. Mrs. Gunning's letter to the editor of the *Religio-Philosophical Journal*, published above, is a reply to that "correction." Mrs. Gunning had sent her letter to the journal mentioned, but as it has not appeared within reasonable time, it is now given a place in our columns.

The remainder of Mrs. Gunning's letter, having no reference to THE OPEN COURT, is, with her permission, omitted.—Ed.]

### THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

CHAPTER XXVII—Continued.

The Prince walked slowly into the room. He bowed silently to Ilse, and gave his hand to the Professor. "My father has commissioned me to express to you his pleasure that you have fulfilled his wishes;" and, turning to Ilse, he continued: "I trust that you will find the dwelling comfortable enough not to regret having left your residence at home."

Ilse looked with great pleasure at her Prince. He had, it appeared to her, grown a little. His demeanor was still rather depressed; but he had color in his cheeks, and it was clear that things were not amiss with him. The little moustache was stronger and became him well.

She replied, "I scarcely venture to turn round. It is like a fairy castle. One expects every moment that a spirit will spring from the wall and inquire whether one wishes to go through the air, or that four swans

\* Translation copyrighted.

will stop at the window with a golden carriage. No chair is necessary to ascend to it, for the windows come down to the ground. The Park Street sends its greeting, and I give your Highness heartfelt thanks for the present which the Chamberlain sent me for the last Christmas-tree."

The Professor approached the Prince, mentioned to him the names of some of his colleagues, who had sent to him their kindest remembrances, and then begged him to express to his royal father his thanks for this hospitable reception.

Everything seemed to curl in ornamental scrolls. The lamps shone from the silver chandeliers, the hyacinths sent out sweet fragrance from every vase, the closed curtains gave the room a comfortable appearance, and on the frescoed ceiling a flying Cupid was represented holding a bunch of red poppies over the heads of the guests.

"To-day we will leave you to rest, as you must be tired," said the Prince, concluding the visit; and the Chamberlain promised to inform the Professor at an early hour the next morning when the Sovereign would receive him. Scarcely had the gentleman gone when a servant announced that dinner was served in the next room.

"Why, it is evening," said Ilse, shyly.

"Never mind," replied the Professor, "you have taken the first step. Show good courage." He gallantly offered her his arm. The man in smart livery conducted them into the next room, and drew back the chairs of the richly-adorned table. There was no end of courses. In spite of Ilse's protest a superabundant dinner made its appearance, and she said, at last, "I must resign myself to everything. There is no use in struggling against these spirits. Whoever lives in a Prince's household must be bold enough to go through all."

When the dinner at last was carried away, and Ilse had been freed from her anxieties about Gabriel, she busily began arranging her things. While she was unpacking she said to her husband, "This is a very charming welcome, Felix, and I now have real confidence that all will go well."

"Have you ever doubted it?" asked the Professor.

Ilse answered, "Up to this hour I have had a secret anxiety, I know not why, but it has now vanished; for the people here all seem so friendly and kind-hearted."

As the Prince passed through the gardens back to the castle the two cavaliers behind him conversed together.

"A charming woman," said the Marshal—"a beauty of the first order. There is good blood there."

"She is in every respect a distinguished lady," replied the Chamberlain, aloud.

"You have already told me that once," replied the Marshal. "I congratulate you on this acquaintance from the University."

"How do you like the Professor?" asked the Chamberlain, turning the conversation.

"He appears to be a clever man," replied the Marshal, with indifference. "It is long since the pavilion has had such a beauty in it."

The Prince turned round, and he saw by the light of the large chandelier that the gentlemen exchanged looks with one another.

The Prince's carriage drove up. He entered it without saying a word to his companions, and drove to the opera. There he entered the ante-room of the royal box.

"How do the strangers like their abode at the pavilion?" asked the Sovereign, kindly.

"They are content with everything," replied his son; "but the rooms are damp, and would not be healthy for a prolonged stay."

"They were never considered so, as far as I recollect," replied the father, coldly, "and I hope you will be convinced of it." Then, turning to the Chamberlain, he said, "To-morrow, after breakfast, I wish to speak to Mr. Werner."

The Hereditary Prince went into the box to his sister, and seated himself silently at her side.

"Where are the places for the strangers?" asked the Princess.

"I do not know," replied her brother.

The Princess looked behind her inquiringly.

"The strangers' box is opposite," explained the Chamberlain; "but they have enough to do to-day settling themselves."

"What is the matter with you, Benno?" asked the sister, after the first act. "You cough."

"I have caught a little cold. It will pass."

After the theatre the Prince retired to his bed room, and complained to Krüger of a headache and sore throat. When he was alone, he opened the window and looked across the pleasure-ground to the pavilion, the lights of which glimmered like stars in the night. He listened. Perhaps he might hear some sound from there. He found it warm, for he took off his necktie, and long stood motionless at the window, till the cool night air came into his room and the last light was extinguished. Then he closed his window gently and went to bed.

This was not prudent, for the Prince, whose health was easily affected, awoke the following morning with a severe cold. The doctor was hastily called, and the Prince was obliged to keep his bed.

When the indisposition of the Hereditary Prince was announced to his father, it put him in a bad humor. "Just now!" he exclaimed. "He has every mis-

fortune unhealthy people are heir to." When, afterwards, the Professor was announced, the way in which he received the announcement was so cold and constrained that the Chamberlain felt very anxious about the reception of the Professor. The long habit, however, of receiving graciously, and the dignified bearing of the Professor, had a softening influence. After a few introductory words, the Sovereign began a conversation about Italy; and it appeared that the Professor was in correspondence with a distinguished literary Roman, who was one of the Sovereign's most intimate acquaintances when he was last in Italy. This gradually placed the Professor in quite a different light to the Sovereign. He had sent for him as a mere useful tool, but he now found he was a man who had claims to personal consideration, because he was known to others whose position was respected by the Sovereign. The Sovereign then asked how the matter of the lost manuscript stood, and smiled at the eager zeal of the Professor, when he told him of the new clue which he had found in the records.

"It would be well for you to prepare a memorial of the whole state of the affair, which will assist my memory, and add to it what help you wish from me or my officials."

The Professor was very grateful.

"I will not deny myself the pleasure of taking you to the museum," continued the Sovereign. "I shall thus see what a learned man, who is a thorough connoisseur, thinks of the quiet amusement of an amateur collector."

The doors flew open, the learned man entered the spacious rooms with the Sovereign. "We will first go rapidly through the rooms that you may obtain a general view of their contents and arrangements," said the Sovereign. While the Professor looked at the abundance of beautiful and instructive remains of antiquity, many of which were quite new to him, the Sovereign gave some account of them; but soon left it to the learned man to search out for himself objects of interest, and it was now his turn to give explanations. Here there was an inscription, which no one probably had copied; there a specimen of pottery, with very interesting figures on it; then a statuette, a remarkable variation of a celebrated antique piece of sculpture; here the unknown coin of a famous Roman family, with their coat of arms; and there a long row of amulets, with hieroglyphics.

It was a great pleasure to the Sovereign to find out the importance of apparently insignificant objects, and every moment to receive new information concerning their value and names, but the Professor had the tact to avoid long explanations. He looked with quite a youthful interest on the collection. It happened just at a time when he was not occupied with

great works, he brought with him a lively susceptibility for impressions, and at every step he felt how charming were the new views which he obtained; for there was much here that invited a closer examination. He inspired the Sovereign with something of the enjoyment he felt himself. There was no end of his questions, and the answers of the Professor. The Sovereign was delighted to tell how he had obtained many of the objects, and the Professor, by relating similar stories of discoveries, led him on to give further accounts. Thus some hours passed without the Sovereign experiencing any weariness, and he was much astonished when he was told that it was dinner-time. "Is that possible?" he exclaimed. "You understand the most difficult of all arts, that of making the time pass quickly. I expect you at dinner; tomorrow you shall see the collection again, undisturbed by my remarks; then you must favor me with a written report of what is desirable with respect to the arrangement, so as to make the valuable objects serviceable to science."

At dinner—there was no one present but some gentlemen whom the Professor, by the advice of the Chamberlain, had visited in the morning—the conversation was continued. The Sovereign related much about Italy, and contrived in a cursory way to draw attention to the personal relations of the Professor with his own acquaintances, in order that his Court might know something about the man with whom he was so much pleased. The conversation was easy and pleasant, and before the Sovereign left the company, he turned again to the Professor, and said, "I desire much that you should feel at home with us, and I hope to pass more than one day as agreeably as I have done this."

To the Professor also it had been a refreshing day, and in going away, he said, in great spirits, to the High Steward: "His Sovereign Highness understands very well how to say kind things."

The High Steward bowed his white head civilly, and replied, "That is the vocation of princes."

"Certainly," continued the Professor; "but so warm an interest in the details of a remote province of scientific inquiry is more than I had anticipated."

The High Steward made a courteous movement, which was to signify that he could not contradict the assertion; he enveloped himself in an old-fashioned little mantle, bowed silently to the gentlemen who were similarly occupied, and entered his carriage.

(To be continued.)

The whole earth is the sepulchre of great men; not only are they commemorated by columns and inscriptions in their own country, but in foreign lands there dwells also an unwritten memorial to them, graven not on stone but in the hearts of men.

—Pericles.

## Recent Contributions to 'The Open Court.'

## REMINISCENCES OF MR. ALCOTT'S CONVERSATIONS.

MRS. EDNAH D. CHENEY. In Nos. 49 and 50.

In Nos. 49 and 50 The Open Court publishes a paper upon Mr. Alcott's conversations, read by Mrs. Ednah D. Cheney before the Memorial Meeting of the Concord School of Philosophy. Mrs. Cheney's recollections of Mr. Alcott lead us back as far as the year 1850. The reminiscences cover almost a half a century of Mr. Alcott's intellectual life. Abstracts are given of his conversations, incidents described in which noted contemporaries figured, and anecdotes told illustrative of Mr. Alcott's life and thought.

Wheelbarrow, in No. 52, contributes an additional reminiscence of this "amiable philosopher and venerable man."

## THE PROBLEM OF CAUSALITY.

In No. 55 is an editorial discussion of The Problem of Causality. The surpassing importance of this subject renders a clear conception of it absolutely indispensable to correct observation and sound reasoning. Despite this the problem has been unbecomingly neglected, and this neglect has given rise to innumerable errors and to an astounding lack of lucidity in scientific discussion. The problem is treated with clearness and precision; simplicity of presentation being especially aimed at.

The comments and discussions elicited by the article on "Causality" will be found to be especially instructive and elucidative. In Nos. 58, 59, and 60, Mr. William M. Salter advances a series of critical remarks, which are replied to in the same numbers by the articles, "Causes and Natural Laws" (No. 50), "Is There Anything Unknowable in Causation" (No. 59), "Is Nature Alive," and "The Stone's Fall" (No. 60). In No. 58, Mr. M. A. Griffen writes a letter upon the same subject; in No. 60, Dr. Edward Brooks, of Philadelphia, comments upon the standpoint taken: all of which are accompanied by editorial comments.

## GHOST STORIES.

By L. J. VANCE. In Nos. 59, 60 and 61.

The object of these studies in Comparative Folklore is not to account for every detail of every wild and senseless ghost story. Their purpose is to classify and compare the ghost lore of civilized and uncivilized peoples, and to show that the legends of the former are evolved from the savage fancies of the latter. The belief in the power and permanence of the souls of the dead is characteristic of savage nations. These beliefs have been retained by the uncivilized folk of more advanced civilizations, and the senseless parts are to be regarded as 'survivals' of their earlier and cruder form. The main thesis of these investigations is, that the "supernatural stuff" of ghost stories is the same the world over, whether in the hut of Bushman and Hottentot, or in the more elaborate illusions of a modern drawing-room séance.

## FREE TRADE AND PROTECTION.

By EDWARD C. HEGELER. In No. 62.

Political questions have not been introduced into THE OPEN COURT; but as the burning questions of the day must be judged from ethical principles, the problem of Protection or Free Trade is here viewed from the religious, *i. e.*, humanitarian standpoint. The general ethical law is: "Aspire to a higher humanity." How shall we attain to this higher humanity? by protection? by restricting other nations from competing with us? by taking advantage of temporary international circumstances? No. Experience shows that competition is the foundation of progress. The truly ethical policy is that which affords the greatest opportunities and offers the least obstacles to the onward movement of the human race. Thus, from the humanitarian point of view, protection fails to stand the test.

## THE PSYCHIC LIFE OF MICRO-ORGANISMS.

ALFRED BINET. In Nos. 49, 50, 51, 55, 56, 57 and 58.

In the whole domain of Natural Science no field of investigation affords such a fascinating complexity of phenomena or such a vast wealth of vitality as the Kingdom of the Protozoans, the minute organisms revealed to us by the aid of the microscope. They inhabit the water we drink, the food we eat, the air we breathe. They live as parasites in the intestines and flesh of animals, and in plants; aiding or injuring their hosts, as the case may be. They lie dormant in a particle of dust, a legion in number. They roam free and unconfined in a drop of water, to them a world. Infinite in number, variety of size and manner of appearance, the same beings that the unaided vision of man cannot alone discover, form no unimportant factor in the construction of continents and in the configuration of the surface of the globe. They are the simplest known forms of life, and every contribution that throws light upon their mode of existence, cannot fail to be of transcendent interest to biologist and scientists in general.

M. Alfred Binet, the collaborator of Ribot and Péro, and one of the most eminent representatives of the French School of Psychology, has presented in this series of articles the results of the most recent investigation into this department of Life. Every phenomenon that the improved methods of microscopic research have shown to be indicative of an exercise of intelligence, will, or feeling in these minute beings is fully discussed and analyzed. M. Binet has added much by these articles to the psychology of the microscopic world; he has opposed many theories, confirmed others, and advanced many conclusions of his own. The articles have been translated from the *Revue Philosophique*, and the original cuts procured from the publishers.

## PROF. WILLIAM D. GUNNING.

A Memorial Address by Frederic May Holland. In No. 61.

Prof. William D. Gunning died at Greeley, Col., on the 8th of March, 1888. His active and exemplary career of sixty years was devoted to the advancement of scientific thought, and marked by an uncompromising loyalty to truth. The memorial address, by Mr. Frederic May Holland, is a just and fitting tribute to a noble life.

## PLANTATION FOLK-LORE.

L. J. VANCE. In Nos. 47, 48, and 49.

Mr. Vance reviews and discusses the movement and widespread interest in popular tales which has produced the recent collections of Negro Myths by Joel Chandler Harris ("Uncle Remus") and Mr. Charles C. Jones. These tales form an important addition to the Folk-Lore of the New World, and Mr. Vance's review will be welcomed by all who wish to acquire a comprehensive estimate of the significance of these Myths to comparative literature and the science of comparative ethnology.

## THE HIBBERT LECTURES AND THE GAULISH PANTHEON.

By S. ARTHUR STRONG. In No. 63.

An instructive essay upon the purposes of the Hibbert Foundation, with a review of the recent lectures by Prof. John Rhys upon the religion of the ancient Celts. The original investigations of Prof. Rhys have thrown a new and welcome light upon the forms of belief in ancient Gaul, Wales, and Ireland, and they are regarded as a monumental work in the province of philological archaeology.

## THE SPIRITUALIST'S CONFESSION.

By MONCURE D. CONWAY. In No. 63.

An interesting article upon the recent confession of the Fox Sisters at the Academy of Music, N. Y., with a short historical sketch of the Spiritualist movement in America and England.

## DRUMMOND'S NATURAL LAW IN THE SPIRITUAL WORLD.

JAMES HERRIN. In No. 56.

An instructive criticism of a book "that has created a sensation in certain orthodox circles, and which, when superficially considered, has the appearance of substantiating certain Christian dogmas by scientific analogies." Mr. Herrin points out the inconsistencies resulting from the further development of Drummond's doctrines and mentions several natural principles which were not admitted into the analogy.

## THE QUESTION OF IMMORTALITY.

Is treated in the Editorial of No. 25, "Evolution and Immortality." It is shown that Immortality according to the Monistic view is immanent; it is a continuance of ourselves in our children, in our ideas and in the work we have done during life. Rudolf Weyler in his essay, "THE PROCESS OF PROGRESS," in No. 24, speaks of death as a mere transition and C. Billups in a letter of No. 25 criticises the wrong notion of a transcendent immortality as taught by Dualism.

## DETERMINISM VERSUS INDETERMINISM.

Prof. GEORG VON SZYCKI. In Nos. 25 and 26.

Prof. Georg von Szycki is Professor of Philosophy at the University of Berlin. His name is well known beyond the boundary of his country. The problem of the Freedom of the Will has perhaps never been treated in a clearer and more forcible manner. Contributions on the same subject have been published from E. F. Powell and Xenos Clark.

## THE ANIMAL SOUL AND THE HUMAN SOUL.

CARUS STERNER. In Nos. 37, 41, and 43.

An essay full of fine thought and psychological depth. Carus Sterner well understands to follow a subject as historically developed in the realm of human opinion and as ultimately affected by the light of Modern Science. The question of the relation of the animal to the human soul has ever been of interest and in this essay we find it attractively yet accurately treated.

## ETHICS AND PUBLIC LIFE.

W. M. SALTER. In No. 45.

The well-known lecturer of the Society for Ethical Culture in Chicago bravely probes the wounds of our public life and shows his patriotism by boldly denouncing the evils and wrongs of American politics. But he is no pessimist; he does not despair of improvement and progress. He knows very well that men "of Roman virtue" still exist. Mr. Salter wants to elevate our conception of politics, so that the best men in the community would lose their repugnance to public life; that they would enter it once more to make it great and illustrious.

## THE INDIVIDUALITY OF ATOMS AND MOLECULES.

Rev. H. H. HIGGINS M. A. In Nos. 41 and 42.

Mr. Higgins says: "Evolutionists have to choose between discontinuity and the recognition of a universal principle of life, which may be regarded not as mechanical, but as inherent in the primordial atom." This idea underlies the theory of J. G. Vogt also. But Mr. Higgins attributes an individual *bius*, or life-unit, to every atom, while Vogt postulates a continuous, contractile, elastic world-substance, wherein the atoms of modern chemistry are made to be centres of condensation. Mr. Higgins hypothesizes endows each atom with an idiosyncrasy which comprehends all that determines its individuality and makes it what it is. The essay should be read in connection with a letter in No. 43 upon "The Origin of Life and the Problem of Memory."

## THE INTERNATIONAL COUNCIL OF WOMEN.

MONCURE D. CONWAY.

A timely word about a remarkable and encouraging progress in the development of human kind.

# SCRIBNER'S IMPORTANT NEW BOOKS.

## CYCLOPEDIA OF MUSIC AND MUSICIANS.

Edited by JOHN DENISON CHAMBLER, JR. Critical editor, WILLIAM F. APPELBY. With over 2,000 illustrations, including 36 full-page etched portraits. 3 vols., 410, decorated parchment binding, uniform with the "Cyclopedia of Painters and Paintings." This edition limited to 500 numbered sets for this country and 50 for Europe. \$25.00 per vol.

This work founds its claim to a high place in the literature of its art upon the character and comprehensiveness of the information which, through its text and illustrations, it for the first time makes accessible; the new simplicity of its arrangement; and the bibliography, of a kind hitherto unattempted, through which it furnishes a key and guide to the whole literature of music. In other words, it is—

A FULL BIOGRAPHICAL DICTIONARY of the musicians of all times and all schools.

A GUIDE TO MUSICAL LITERATURE embracing works in all languages.

The thirty-six portraits etched expressly for this edition will be divided among the three volumes, the first of which will be ready immediately. Those wishing to secure copies should make application at once, as a large part of the edition is already subscribed for. A full descriptive circular will be sent to any address.

## A HISTORY OF FRENCH PAINTING

From its Earliest to its Latest Practice, including an account of the French Academy of Painting, its Salons, Schools of Instruction, and Regulations. By C. H. STRANAHAN. Illustrated. 1 vol., 8vo, \$5.00.

The comprehensiveness of Mrs. Stranahan's book is well indicated by the sub-title; and the importance of the volume as a contribution to the history of art is not easily over-estimated. Every phase of the subject is treated with detailed fulness, and the work thus occupies a place that has always been vacant. Its usefulness as a book of reference or for general reading is combined with an attractiveness that makes its publication at this season peculiarly fitting. The well-known artist, Edwin H. Blashfield, has designed a handsome cover for the volume, and this, with the sixteen full-page reproductions of the masterpieces of French painters of all times, gives the work a rich appearance, and emphasizes its value as an interesting and useful gift book.

## THE DIARY AND LETTERS OF GOUVERNEUR MORRIS.

Member of the Constitutional Convention, Minister to France, etc. Edited by ANNE CARY MORRIS. 8vo, 2 vols., \$7.50.

The journal and letters of a man so active and conspicuous in the events of his time as Gouverneur Morris have naturally attracted the greatest interest and admiration of his countrymen. As a citizen of the Republic, and the most brilliant men and women of France, were his chosen friends, and pen-portraits of these are presented in the pages of this work. The material is as fresh and interesting to-day as when it was written, and is destined to establish the book at once in the front rank of works of its kind.

## LETTERS OF THACKERAY

A new edition, with portrait of Thackeray and reproduction in fac-simile of a characteristic letter. 1 vol., 12mo, gilt top, \$1.25.

In this dainty edition these famous letters will again be sought for by thousands to whom the earlier editions were inaccessible.

## THE REVERIES OF A BACHELOR.

With all the illustrations, printed in tint, made by F. O. C. DARBY for the original Illustrated edition. Square 8vo, \$3.00.

"One of the most tender and touching works in our literature. It would be hard to name its equal."—*N. Y. Tribune*.

\* \* \* **THE CHRISTMAS BOOK BUYER** is the most beautiful Christmas literary annual richest illustrations—many in elegant colors. Its contributors are: H. M. Marvel, J. James Whitcomb Riley, Sarah Orne Jewett, Octave Thanet, George Parsons Latrop, Mrs. Burton Harrison, Rossie Johnson, W. C. Brownell, etc., etc. It is a complete guide to the Christmas literature of the year, and as handsome as it is useful. Sent for ten cents to any address, if THE OPEN COURT is mentioned, or free to any one who will send \$1.00 for a subscription to THE BOOK BUYER for 1899.

\* \* \* For sale by booksellers, or sent, post-paid, upon receipt of price, by the publishers.

CHARLES SCRIBNER'S SONS, 743 & 745 BROADWAY, N. Y.

## A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

CHAS. W. SMILEY, Publisher,

Box 530, WASHINGTON, D. C.

A CYCLOPEDIA OF THE GREAT MUSICAL works with reproductions in fac-simile of famous scores.

A SUPERB COLLECTION OF ILLUSTRATIONS of all phases of the subject.

## MEN AND MEASURES OF HALF A CENTURY.

Sketches and Comments. By Hon. HUGH McCULLOCH. 8vo, \$1.00.

"Mr. McCulloch modestly entitles his work 'Sketches and Comments.' But the sketches are so sharp in outline, so positive in feature; the comments are so explicit, and delivered with so ex cathedra an air of personal observation and infallible accuracy, that the volume must become one of the standard works in the history of our time."—*Chicago Tribune*.

"Hardly any other volume of contemporary memoirs is entitled to greater consideration than this. It comes from one whose judgment was keen, clear, and accurate, and whose opinions are entitled to great weight."—*Boston Herald*.

"We find what we want on every page—the author's keen recollections of distinguished men and important affairs."—*Philadelphia Press*.

## STUFF AND NONSENSE.

By A. B. FROST. New edition, with new cover and additional drawings and sketches. 8vo, \$1.25.

The drawings and sketches added by Mr. Frost have made almost a new work of this revised edition.

"A most amusing literary and artistic salad."—*N. Y. Telegram*.

## THE FIVE TALENTS OF A WOMAN.

By the author of "How to be Happy though Married." 12mo, \$1.25.

"The book is witty, sensible, and bright. It is crowded with racy insights relating to character, temperament, acquisitions, costumes, and fascination."—*Boston Traveller*.

# LONGMANS, GREEN & CO'S NEW BOOKS.

## GRASS OF PARNASSUS.

A volume of selected verses. By ANDREW LANG. Foolscap 8vo, printed on hand-made paper and bound in cloth, gilt top, \$1.75.

"Grass of Parnassus, the pretty autumn flower which grows at the foot of the Muses' Hill."—*N. Y. Tribune*.

## PEN AND INK.

Papers on subjects of more or less importance. By BRANDER MATTHEWS. With a poem by ANDREW LANG, and "An Epistle to the Author," in verse by H. C. BUNNER. 12mo, cloth, gilt top, \$1.50.

Essays on Locker and Debon, on War Songs and Short Stories, on the Antiquity of Justice, and on the Ethics of Plagiarism. The volume also contains the first series of papers yet written on the genesis and practice of the American Game of Poker.

B. C. 1887.

A Ramble in British Columbia. By J. A. LEE and W. J. CUTTERBURY, authors of "Three in Norway." With map and 75 illustrations from sketches and photographs by the authors. Crown 8vo, ornamental cloth, \$2.25.

## Correspondence of Daniel O'Connell, the Liberator.

Now first published. With a memoir and notes. By WM. J. FITZPATRICK, F. S. A. With portrait, 2 vols., 8vo, \$9.00.

## The Eulogy of Richard Jefferies.

By WALTER BESANT. With portrait. Crown 8vo, cloth, \$2.00.

"I call this book the 'Eulogy' of Richard Jefferies because, in very truth, I can find nothing but admiration, pure and unalloyed, for that later work of his, on which will rest his fame and his abiding memory."—*Extract from Preface*.

## THE SON OF A STAR.

A ROMANCE of the Second Century. By BENJAMIN WARD RICHARDSON, M.D., F.R.S. Crown 8vo, \$1.50.

## Our Sentimental Journey through France and Italy.

By JOSEPH and ELIZABETH ROBINS PENNELL, authors of "A Canterbury Pilgrimage," etc., etc. With map and 121 illustrations by Joseph Pennell. 12mo, \$1.75.

## The Record of a Human Soul.

By HORACE G. HUTCHINSON. 12mo, cloth, \$1.00.

"This short narrative . . . is not a novel—a work of fiction. . . the extracts from the diaries are genuine; they are what they pretend to be—honest records of a soul's struggles and experiences as they appeared to the consciousness of him who suffered them."—*Extract from Preface*.

## MASKS OR FACES?

A Study in the Psychology of Acting. By WILLIAM ARCHER. (In the Press.)

This is a collection of anecdotic evidence bearing upon the question, "To feel or not to feel?" started by Diderot in his "Paradoxe sur le Comédien," and recently discussed by Mr. Irving and M. Coquelin. It embodies the answers of living actors to Mr. Archer's "Questions on the Art of Acting," along with a large amount of testimony gleaned from the records of the stage.

## A New Volume of Folk-Songs.

## The Besom Maker, and Other Country Folk-Songs.

Collected and illustrated by HEWWOOD SUMNER, with music. Small 4to, boards, \$1.00.

Mr. ANDREW LANG's charming tale of Fairy Lore and Buried Treasure.—*Saturday Review*.

## THE GOLD OF FAIRNILEE.

By ANDREW LANG. Fifteen colored illustrations, after drawings by T. Scott and E. A. Leemann. 4to, cloth.

Messrs. Longmans, Green & Co. will be happy to send their Catalogue of General and Educational Books post free to any address furnished for the purpose.

FOR HOLIDAY BOOKBUYERS!

## J. B. LIPPINCOTT COMPANY'S Standard and Popular Works.

### WORCESTER'S DICTIONARY.

Standard Royal Quarto Dictionary of the English Language. Unabridged. Profusely illustrated. Thoroughly Revised. 226 pages. Sheep, \$10.00; half turkey morocco, \$12.00; half russia, \$12.00.

### WORCESTER'S NEW ACADEMIC DICTIONARY.

Containing all the more complete new words, together with hundreds of new illustrations. Reset from new type and printed from new plates. 8vo, half roan, \$1.50.

### Lippincott's Pronouncing Gazetteer of the World.

A Complete Geographical Dictionary. 2680 pages. Royal 8vo, sheep, \$12.00; half morocco, \$15.00; half russia, \$15.00.

### Lippincott's Pronouncing Biographical Dictionary.

Containing Complete and Concise Biographical Sketches of the Eminent Persons of all Ages and Countries. By J. THOMAS, M. D. LL. D. 1 vol. 2550 pages. Imperial 8vo, sheep, \$12.00; half morocco, \$15.00; half russia, \$15.00.

### ALLIBONE'S CRITICAL DICTIONARY OF AUTHORS.

By S. AUSTIN ALLIBONE, LL. D. 3 vols., imperial 8vo, extra cloth, \$22.50; sheep, \$25.50; half morocco, \$31.50; half russia, \$33.00.

### ALLIBONE'S QUOTATIONS.

By S. AUSTIN ALLIBONE, LL. D. Complete in 3 vols.

1. POETICAL QUOTATIONS.

2. PROSE QUOTATIONS.

3. GREAT AUTHORS OF ALL AGES.

Price per set, in cloth, \$9.00; half russia, \$12.00.

Each sold separately.

### Chambers' Encyclopædia.

A New Edition. Vols. I. and II. ready. Edited and published under the auspices of W. & R. Chambers, Edinburgh, and J. B. Lippincott Company, Philadelphia. Entirely Revised and Rewritten. Complete in 10 vols. Price per vol., cloth, \$3.00; cloth, uncut, \$5.00; sheep, \$1.00; half morocco, \$1.50.

Also a Revised Popular Edition, and Household Edition, Revised. In 10 vols., royal 8vo, bound in various styles, at prices ranging from \$15.00 to \$19.00.

### The Merchant of Venice.

VOL. VII. of the Variorum Edition of Shakespeare. Edited by HORACE HOWARD FURNESS, Ph. D., LL. D., L.H.D. Royal 8vo, cloth extra, gilt top, \$1.00. When completed this magnificent work will be entirely incomparable, for each volume is a Shakespearean library in itself, and will contain the best criticisms that have ever been written. The volumes previously issued are, "Romeo and Juliet," "Hamlet," [2 vols.] "Macbeth," "King Lear," and "Othello."

### Half-Hours With American History.

Selected and arranged by CHARLES MORRIS. 2 vols., crown 8vo, uniform with "Half-Hours with the Best American Authors," cloth, \$3.00; half morocco, \$5.00; three-quarters calf, \$6.50.

### Half-Hours With the Best American Authors.

Selected and arranged by CHARLES MORRIS. Complete in 4 crown 8vo vols., cloth, \$6.00; half morocco, \$10.00; three-quarters calf, \$13.00; 8vo size, 4 vols.; half cloth, \$10.00.

### Half-Hours With the Best Foreign Authors.

Translations selected and arranged by CHARLES MORRIS. 4 vols., crown 8vo, uniform with "Half-Hours With the Best American Authors," cloth, gilt top, \$6.00; half in morocco, \$10.00; three-quarters calf, \$13.00.

### UNIVERSAL HISTORY.

In 3 vols., 12mo, extra cloth, gilt top, as follows:

ANCIENT HISTORY. By GEORGE RAWLINSON, M. A. \$1.50.

MEDIEVAL HISTORY. By GEORGE THOMAS STONES, D. D. \$1.50.

MODERN HISTORY. By ARTHUR ST. GEORGE PASTOR, B. A. \$1.50.

GEOLOGICAL HISTORY. By EDWARD HULL, M. A., LL. D. Extra cloth, gilt top, \$1.25.

## THE PHYSIOLOGICAL FUNCTION OF THE NUCLEUS IN MICRO-ORGANISMS.

BY ALFRED BINET.

Translated from the *Revue Philosophique* by *μικρ.*\*

It would be of the highest importance to know what is the seat of the phenomena of the life of relation in the bodies of Micro-organisms. We have seen that Micro-organisms are the equivalent of a simple cellule, composed, according to the classic plan, of a protoplasm, of a cellular nucleus, and of an enveloping membrane.

Each of these elements plays a part of special importance in the vital phenomena of these beings. Long since, scientists have attributed movement, sensibility, and the prehension of foods to the protoplasm. This was the result of direct observation. While observing an *Amœba*, for example, the protoplasm is seen to undergo modifications of form and to throw out pseudopodia, either for the purpose of effecting a change of position, or to seize alimentary substances. The protoplasm, accordingly, seems to be the sole agent of all these phenomena. Likewise, the vibratile cilia of the Ciliates, which are at once organs of motion, prehension, and touch; the suckers of the *Acinetinidæ*, which are special organs of prehension, are nothing else than outward expansions of the protoplasm proper.

As regards the enveloping membrane, the same cannot discharge any psychical function; firstly, because it is a product of protoplasmic secretion; and, secondly, because it is wanting in many Protozoans and even in many animalcula quite high in point of organization that, despite their nudity, exhibit marks of psychic life just as complex as those observed in Infusoria having a cuticle. The part acted by the nucleus does not so clearly manifest itself to direct observation; it executes no movements in the ordinary conditions of life; it remains motionless in the centre of the animal's body, surrounded on all sides by the protoplasm; unlike the latter, it is not in direct contact with the outside world.

The first phenomena that have enabled us to conjecture as to the significance of the nucleus, have to do with the division of cellules; when a cellule divides, the nucleus comes into action, it exhibits certain

movements and passes through complicated stages which have been given the name of caryokinesis.\*

But these complex phenomena simply show the function of the nucleus as an histological element; they do not afford any disclosures as to the physiological rôle of the nucleus in the cellule.

Other observations have enabled naturalists to surmise what phenomena are subject to the action of the nucleus. In 1881, Balbiani called attention to individuals belonging to the species *Paramœcium aurelia*, that were destitute of a nucleus and which nevertheless possessed the power of locomotion the same as ordinary individuals; whence, he concluded that the nuclei exerted no influence upon the phenomena of individual life. Shortly afterwards, Gruber observed small specimens of the *Actinophrys sol* which absorbed nutriment, changed their position in the liquid, and even fused with each other (zygosis), but which were nevertheless destitute of a nucleus.†

The idea then occurred to Gruber, and to Nussbaum likewise, to divide the Micro-organisms by artificial means into several fragments, of which some would contain a nucleus and others not, and then to watch what would come of it. Gruber, to whose experiments the most importance attaches, chose as his subject of trial the *Stentor coerulesus*, a ciliated Infusory of great size, which exhibits a nucleus resembling a chaplet of beads (moniliform). He afterwards continued his experiments upon other species, and his conclusion was, that the power to regenerate lost parts belonged to all Protozoans, but that this phenomenon only took place when the isolated fragment contained some portion of the nucleus; in which case the animal reproduces all the organs it has lost in consequence of its dissection. Furthermore, the process of the formation is exactly the same as in the spontaneous division of these same Infusoria. The excitation caused by their removal is accordingly of the same character as the unknown excitation that provokes the natural division of the body.

From these experiments, the part acted by the nucleus is indicated by complete evidence. Gruber shows that in a single instance only can a fragment without

\* Translation copyrighted.

\* *κάρυον*, nut, nucleus, and *κίνησις*, motion, disturbance.

† Contributions to the *Biologisches Centralblatt*, 1885, p. 73.

a nucleus form itself anew; and that is, when the fragment contains an organ in course of formation, as happens, for example, during the spontaneous division of the animal. This amounts to saying, that the presence of a nucleus is necessary to give the impulse to the formation of the organ, but that it is not necessary to the completion of the organ when the impulse has once been given.

Lastly, if the fragment is totally destitute of a nucleus, it does not re-form itself so as to constitute a complete animal again; if the fragment possesses neither mouth nor peristome, it does not reproduce a new mouth and a new peristome; yet the fragments continue to live and to move. The absence of a nucleus does not suspend the functions of motion, sensibility, nutrition, or growth. This conclusion is, in our estimation, too sweeping, as we shall see further on.\*

M. Balbiani has recently repeated these experiments of artificial division, and, while confirming in general the results of Gruber as to the function of the nucleus in the vital phenomena of ciliated Infusoria, he has endeavored to fix with more exactness a certain number of important points. His first experiments, like those of Gruber, were conducted upon the *Stentor caruleus*, a species of which the size renders it better adapted to this sort of experimenting. In an observation which we shall take as a type, and which is represented by the figure sent to us by M. Balbiani, the body of the *Stentor* is cut by two transverse sections; three divisions are obtained, each of which contains a fragment of the nucleus. We will remember that the nucleus of the *Stentor* is like a long string of beads; it is not at all rare to see a fragment of a *Stentor* contain one or more beads.

Fig. 12.—Artificial division of the *Stentor caruleus*.  
(After Balbiani.)

Let us follow the phenomena presented in the middle segment. This segment contains only a single grain of the nuclear chaplet; directly after severance, it assumed a globular shape; the day following, it had lengthened, had grown a tail at the posterior extremity, and upon the anterior part there had appeared,

distinctly outlined, a crown of cilia longer than those upon the body; in other words, a peristome had formed; the day after, the fragment had increased considerably in bulk, and in two days more the animal had formed a mouth. During this time, the nuclear grain had multiplied: five, in fact, were counted. The animal had the normal form; its size, however, was a little smaller than that of the ordinary *Stentors*. Thus, through the action of a small quantity of nuclear substance, the fragment has been completely reconstructed.

It frequently happens that the artificial severing of the animal causes various deformations in the fragments. The deformation disappears with the greatest rapidity in fragments containing nuclear substance. The wound heals instantly; directly after severance, the two edges of the wound are seen to adjust themselves to each other.

In all these particulars, the experiments confirm the results obtained by Gruber.

M. Balbiani desired to ascertain what would happen if the division were made during the state of conjugation.

Conjugation, as we know, aims at replacing an old, spent element, that has lost its physiological properties, by an element of new formation proceeding from an attendant nucleus (nucleolus) exchanged between the individuals in conjugation. The point in question was to ascertain whether the nucleus that was beginning to disappear, had lost its regenerative power. In the *Stentors*, during conjugation, this old nucleus breaks, and its nuclear globules are scattered to all parts of the protoplasm. When at this stage, the body of one of the *Stentors* is divided in such a manner that the fragment contains some of the scattered globules that came from the old nucleus. It is quite evident that such a fragment is obtainable only by mere accident.

In an experiment which we again cite as a type of many others, the fragment containing the elements of the old nucleus tends to reconstruct itself; this fragment, which represented the posterior part of the animal, presented, the day following, a rudimentary peristome; the reconstruction did not go beyond this point: it was left incomplete. Accordingly, the old nucleus loses its power of regeneration.

As to the phenomena presented in fragments containing no nuclear substance, M. Balbiani has made decided advances in the question; he has completed the experiments of Gruber, he has also corrected them, and he has reached conclusions essentially different.

In order to understand more thoroughly the phenomena connected with the absence of nuclear substance, the author has directed his attention to another species, the *Cyrtostomum leucis*, which has the

\* We have taken as our guide, with the permission of M. Balbiani, the lectures delivered by that eminent authority at the Collège de France, in May, 1887.

advantage that it can be kept longer alive than the Stentor can, on a glass slide holding a drop of water. The *Cyrtostomum* is a large ciliated Infusory of more than four-tenths of a millimeter in length. Its protoplasm is differentiated into two layers, one of which, the cortical, encloses very heavy trichocysts; the other, the endoplasm, holds alimentary substances. The animal exhibits upon one of its faces a mouth, shaped like a long narrow buttonhole, and upon the other face a contractile vesicle, from which crooked and anastomosed passages radiate. It is easy, by making a transversal division, to obtain fragments without nuclear matter; the nucleus of the *Cyrtostomum* being formed of a single, round mass. But it is not easy, on the other hand, to obtain fragments likely to live, since this animalcule has a dense ectoplasm, and, when severed, this layer, which is not very retractile, does not grow together again and close the wound; the sides remain separated, the water comes in contact with the endoplasm, which swells, bulges out, and runs from the wound; the animal may thus void itself completely, dying of diffidence. It occasionally happens that the animal voids itself only in part, and that the nucleus escapes with a small piece of the protoplasm. Then, if the wound draws together, we get a fragment that has thrown out the nucleus by its own action.

We shall not speak of the actions of the fragment containing nuclear substance; they are the same as observed in the case of Stentors: the fragment rapidly reconstructs itself and re-forms a complete animal.

Let us mark more closely the fragment without nucleus. Such fragments continue to live for some time; they have been kept alive as long as eight days; but they do not reconstruct themselves; they do not even assume a regular form; the part of the body facing the section retains its obliquity of truncation. At the start, for the first few days, the movements continue; a curious circumstance connected therewith is, that the fragments continue to move in the direction in which they would have moved if they were placed together to form a complete individual. The vibratile cilia are in no wise altered; they shake with the same animation as before. Only the movements of the animal are a trifle irregular; but they exhibit the same marks of volition as seen in normal individuals. The vesicle continues to contract.

The power to seize food is also retained when the fragment without nucleus contains the mouth; the mouth ingests alimentary substances. If the *Cyrtostomum* be given grains of potato fecula, which it is very partial to, the fragment without nucleus, but with a mouth, swallows these grains and fills itself with them. It is not known whether it digests them.

This much was observed in the first stages, and Gruber was wrong in stopping at this point.

At the expiration of a certain time, varying between the third and fourth day, alterations of structure are noticed in the fragment, that are probably traceable to the absence of the nucleus. One of the first to take place is the disappearance of the marks of differentiation which we have observed to distinguish the endoplasm from the ectoplasm. The dark granules that fill the interior of the body congregate in the centre by abandoning the peripheral part; then these granules scatter and come to a position just beneath the cuticle, which denotes a deliquescence of the plasma. The layer of trichocysts undergoes changes and disappears. All these alterations result from an actual disorganization of the plasma. The contractile vesicle shrinks, its pulsations decrease, the radiating passages disappear. The body of the animal, which in its normal condition is elongate, becomes rounded; its movements flag and consist of nothing but a rotation of the body about its own axis; at last the animal becomes motionless and dies of diffidence.

These changes are not due to lack of sustenance, as one might suppose; for fragments that have a mouth and swallow food, pass through the same alterations as those that have no mouth.\*

It is superfluous to insist upon the importance of these results, obtained by a method that might be called experimental physiology applied to unicellular organisms. Although the experiments have been made solely with ciliated Infusoria, the results of the same may be extended to all cellules, for the Infusoria are nothing more than autonomous cellules living an independent life.

The conclusion from the above researches of M. Balbiani, which, as we have seen, go far beyond those of Gruber, is, that the nucleus is not necessary merely to the regeneration of the parts, as the German professor believed. The error made by Gruber arose from the fact that he did not follow the career of the fragments deprived of a nucleus long enough; if he had continued his observations, he would have seen that the fragment becomes gradually disorganized. The nucleus, accordingly, has not merely a formative power; it does not merely regulate alimentation, readjustment of form, and the healing of wounds; it has not merely a regenerative power, enabling the plasma to reconstruct complete the organs lost by artificial severance. The nucleus is, besides all this, an essential factor of the plasm's vitality. If a fragment of

\* M. Balbiani has informed us, upon request, that the fragments of *Cyrtostomum* furnished with nucleus can be kept alive for a much longer time under the same conditions (that is, in a drop of water on a glass slide kept in the moist chamber of Malassez): in this way it is possible to keep them alive for the space of a month, by introducing into the liquid a few Infusoria to serve them as food. On the other hand, the fragments deprived of nucleus by section live for only eight days at the most.

protoplasm be deprived of its nucleus, the fragment remains alive for some time, but afterwards undergoes disorganization.

Such are the facts, extremely complex, and consequently difficult to summarize by a formulated statement.

We certainly cannot regard the protoplasm as inert matter; but what appears probable is, that the protoplasm receives from the nucleus the communication, the delegation of physiological powers. The nucleus is in a certain sense the focal seat of life in all its forms.

If we get rid of the nucleus by artificial section, the fragment of enucleated protoplasm continues to live for some time, having received from the nucleus an impulsion that has not yet been exhausted; but after a certain length of time, the impulsion given by the nucleus not being renewed, the protoplasm runs its course and dies.

From the psychical point of view, which more particularly occupies our attention here, how are the results of these experiments in cellular vivisection to be explained? When a fragment of an organism, deprived of nuclear substance, is seen to move about freely and with the same activity as if it still possessed its nucleus, we are constrained to admit that the phenomena of the life of relation, or movement and sensibility, have their seat in the protoplasm. But it is probable that such physiological capacities as the powers of nutrition, are not inherent in protoplasm; they depend immediately upon the presence of the nucleus, for they disappear little by little and finally vanish a few days after the removal of the nucleus.\*

It may be mentioned in passing that there are certain psychical properties which the nucleus apparently does not transmit to the protoplasm, but which it retains for itself; this is the case with the instinct of generation. We have already seen that, during the epidemic periods of conjugation, the *Paramecia* which have their nuclei overrun with parasites cease to conjugate with animals of the same species. The destruction of their nucleus by the *Bacteria* produces in the *Paramecia* the effect of actual castration.

The removal of the nucleus, accordingly, causes the interruption of the following functions and in the following order as to time:

1. The regenerative and reproductive property of the plasma;
2. The vitality of the plasma, and the psychical functions.

The psychologist will notice with interest that the psychical function of the protoplasm outlives the re-

generative function for an appreciable length of time: a fragment of a cellule which, having been mutilated by the act of severance, is unable to correct its outward form, or to secrete a fresh cuticle, or to reconstruct its lost organs, is nevertheless still capable of perceiving sensations and of responding thereto by movements. Psychological life is consequently a property of living matter which appears to be less complex than the regenerative property, inasmuch as it ceases later.

To summarize, the nucleus plays the primordial rôle in the cellule; if, to use an old comparison of Aristotle's, we compare the protoplasm to the clay, we must compare the nucleus to the potter that fashions it. The nucleus comprehends all the physiological properties, the totality of which goes to constitute life.

#### A PHILOSOPHICAL VIEW OF THE LAW OF CORPORATIONS.

BY CHARLES T. PALMER.

(Concluded.)

Blackstone classifies all legal rights into the "rights of persons" and "the rights of things." (8) Mr. Thomas Cooley, commenting upon this classification, uses the following language: "All individual rights must be and are *rights of persons*. They may be rights which concern their personal safety or liberty, they may be relative rights pertaining to them as members of families, or civil, or political bodies, or they may be rights to possess, control, or enjoy inanimate things. To speak of the *rights of things* is likely to convey an inexact idea, though correct enough in the sense which is hereafter explained. By the rights of persons we are to understand rights which belong to and are possessed by persons, but in that sense there can be no rights of things. As between man and inanimate or animate things, duties cannot be imposed so as to give the latter rights."

More than one legal principle might be adduced to support this theory. It is manifestly absurd to hold that an inanimate thing, incapable of performing or exacting the performance of an obligation, can, even by the policy of law, be vested with rights. Blackstone himself never intended to convey such a thought. All the rights known to moral ethics are such as vest in natural persons. Legal rights are such moral rights as Courts sanction by the enforcement of a remedy for their violation. Like the title to real estate they cannot remain in abeyance. They must vest in a human agency or be non-existent. Since it is thus manifest that inanimate, though corporeal things, are not capable of having or acquiring rights, how much more is it apparent that that which is both *incorporeal* and *inanimate* cannot have or acquire rights.

\* The difficult question here, is to ascertain whether the psychical properties of the protoplasm are destroyed through the direct effect of the disorganization of the plasma, or whether they disappear a short time before the process of disorganization and in consequence of the absence of nuclear substance.

(8) 1 Black's Com. 122, Note 2 (Cooley).

"That a body framed by the policy of man, whose parts and members are mortal, should in its own nature be immortal, or that a body composed of many bulky, visible bodies should be invisible, in the common acceptance of the words, seems beyond the reach of common understanding. A corporation is as visible a body as is an army, for though the commission or authority be not seen, the body instituted by that authority is seen by all but the blind. When, therefore, a corporation is said to be invisible, that expression must be understood of the *right* of many *persons* collectively to act as a corporation, and then it is as visible, in the eye of the law, as any other right whatever of which *natural* persons are capable. It is a right such as every member has a freehold in and all jointly have an inheritance, which may go by succession." (9)

If, therefore, a corporation has rights, they are such as belong to its members. If it has privileges, immunities, and capacities, they are such as its members do enjoy as natural persons. It is said that only the State has power to create a corporation. But even this power cannot be exercised without the consent of the members of the corporate body. Until they have accepted the charter, no corporation is formed. All the powers contained in the charter are bestowed upon them and their successors. (10) It, the corporation, has no existence until after their acceptance. That which has no existence, cannot be the recipient of legal rights. A thing that cannot receive even the charter which calls it into being, has not progressed very far in the possession of those rights which entitle it to the denomination *a persona*.

What is the true nature of the privileges the members receive? They are granted permission to act as a collective body, under a common or corporate name, by which name they may hold and transfer property; may sue and be sued; and may do all things incident to the management of the corporate undertaking. As members of the corporation they may have perpetual or indefinite succession, *i. e.* the individual membership may change without effecting a dissolution of the corporate body; privileges open alike to every citizen who applies for them, and in which there is no special franchise.

One fact is worth a thousand theories, even in the discussion of a legal proposition. If a corporation prospers, the members of it prosper according to their individual interest. Against all the world, the property of the corporation is theirs individually and collectively, notwithstanding it is held in a corporate name and their interest is subordinate to the corporate will and purpose. The right of property in the

so-called entity is necessarily and purely *nominal*. The *real* parties in interest in every controversy wherein a corporation is involved, are the *persons* who constitute its membership.

It may be suggested that this nominal right of property is sufficient to justify a nominal personality. If jurists had taken this view there would be little cause for criticism. Questions of corporate rights have been determined upon the theory of actual, and not nominal personality. (11) The personality of the members has been said to be merged in that of the legal entity. (12) Corporations are regarded as the creatures of the State under whose jurisdiction they are formed, and are said to be entitled to only such privileges as are not expressly forbidden by the laws of other States. (13)

Under this rule legislation has been repeatedly upheld impugning the privileges of citizenship, as guaranteed by the Federal Constitution.

In *Bank of Augusta v. Earle*, the United States Supreme Court, Ch. J. Taney presiding, held: That the members of a corporation cannot claim their rights under the constitution, to make contracts in other States when acting in a corporate capacity; and that the Court would not look behind the artificial being to ascertain the individual rights of its members; (14) and so held notwithstanding the same Court, Ch. J. Marshall, presiding, had previously decided that, for the purpose of determining a question of jurisdiction, the Court would look behind the corporate entity to ascertain the residence of the members who compose it. (15)

In the light of subsequent history, it may not be difficult to understand the influences which prompted Chief Justice Taney to thus elevate the law of the particular State over that of the nation. Certainly, the reason of the rule assigned by him, is not sufficient to sustain it. "We fully assent to the propriety of *U. S. Bank v. Deveaux*," \* \* "but the principle has never been extended further than it was carried in that case, and has never been supposed to extend to contracts made by a corporation, especially in another sovereignty. If it were held to embrace contracts, and the members of a corporation were to be regarded as individuals carrying on business in their corporate name, and therefore entitled to the privileges of citizens in matters of contract, it is very clear they must" \* \* "take upon themselves the liabilities of citizens." "The result of this would be to make a corporation a mere partnership, in which each stockholder would be liable to the whole extent of his prop-

(9) 1 Kyd on Corps, 15.

(10) "This" (the charter) "is plainly a contract to which the donors, the trustees, and the state, were the original parties." *Opin. Ch. J. Marshall, Dartmouth College v. Woodward*, *Supra*.

(11) *Bronswick v. Dunning*, 7 Mass. 415.

(12) *People v. Assessors*, etc., *Supra*.

(13) *Bank of Augusta v. Earle*, 13 Peters 519.

erty, for the debts of the corporation." "The constitution" \* \* "certainly never intended to give the citizens of each State the privileges of the citizens in the several States, and at the same time exempt them from liabilities which the exercise of such privileges would bring upon the individuals who were citizens of the State."

This may by some be regarded as an argument against the existence of corporations, but has no bearing upon the question whether the privileges of citizenship shall be denied. By the policy of law, the private property of individual members is exempt from liability for corporate debts, not only in one State, but in all States, and the fact that the privilege is sought to be exercised in a corporate capacity furnishes no legal reason why the clause of the constitution should be declared inapplicable.

Chief Justice Taney further says: "Besides it would deprive every state of all control over the extent of corporate franchises proper to be granted."

Modern legislation has effected great changes in the nature of corporate bodies. At one time only kings had power to grant a corporate franchise. Numbers of men, and even single individuals, were constituted *bodies politic* (?) as a mark of royal favor. No unrestrained prerogative can long endure. Parliament early claimed the right in conjunction with kings, to grant corporate privileges; and, in many instances, reviewed and even modified the kingly grant. The principle that only public necessity could justify the grant of corporate powers, became imbedded in the British constitution. The power of the State legislatures to grant unlimited and inviolable charters, was, likewise, curtailed in the United States; and now it is almost universal, that private trading-corporations can be formed only under general laws. The private trading corporation of to-day are not unlike a great limited partnership, wherein all the members are special partners. The change has been so radical as to almost suggest a change of name, the substitution of the word *incorporation* for that of *corporation*; implying thereby, that the body is merely a collection of individuals, acting in an incorporate capacity.

According to the ancient civil law of Rome, the one restriction placed upon the formation of corporations was that their business should be lawful. (16) According to the genius of modern legislation, that is the only restriction to be placed upon them now. By the laws of most states, a corporation may be formed by the mere act of voluntary association, in the manner prescribed. It is conceded that the same business might be conducted by the same individuals, in the same manner, under any form other than that of a corporation. In states where corporate privileges are

equally open to every citizen, and now that the basis of every private trading-corporation is purely conventional, resting upon the contract between the members of it, just as the basis of every co-partnership is conventional, (17) it is difficult to determine why these institutions should not be placed upon the same footing as co-partnerships in respect to this great constitutional privilege. Why the Supreme Court of the United States should, in the case of *U. S. Bank v. Devaux*, recognize the true principle of corporation law when determining a question of its own jurisdiction, which could not affect the merits of the controversy, and should refuse to recognize such principle when determining a question of substantive right, is beyond the reach of ordinary comprehension.

It may occur to many that a corporation can sue and be sued by its members, and if regarded as a collection of individuals, the rule of common law procedure, that no man may be plaintiff and defendant in the same suit, will in such case be impugned. Too much truth has already been sacrificed in order to reduce law to an exact science, and since it is manifest that, in reality, a corporation is a collection of individuals and not an entity, it is sufficiently accurate to regard the case of a corporation suing or being sued by its members, as an exception to the general rule.

Scholastic refinements which have no foundation in fact, like falsehoods, must be constantly varied to meet the exigencies which truth unconsciously thrusts in the way of error. That a being, "invisible, intangible, and existing only in contemplation of law," cannot entertain human thoughts and passions is apparent to the simplest mind, and, whereas, it is the settled rule of criminal law that a person cannot be convicted of crime who is incapable of criminal intent, it was early determined that corporations could not be punished for crime. (18) This doctrine would also exempt them from responsibility for a great variety of torts. "Actual malice" is a necessary ingredient of certain forms of libel. "A wilful intent to deceive," is an element of actual fraud. These, like criminal intent, are psychological facts, and since a corporation has no mind, it cannot logically be made responsible for offenses in which mental processes are a part. But such a deduction left the community at the mercy of these institutions. Courts, accordingly, shifted their ground, and held in effect, that there was such a thing as constructive malice; said that they would impute malice and deceit to these creatures, as arising out of the nature of the act complained of, and so hold them responsible for their torts as if they were natural persons.

It may seem unprofessional to thrust common

(17) 1 Morawetz, Sec. 3.

(18) The Law of Corp'n. Boone, Sects. 78-79-83, and cases cited.

(16) 1 Black's Com. 472. Proffatt on Corp'ns, 11.

sense in the face of legal reason, but the ordinary mind fails to see how it is more consonant with correct law to impute "malice," than to impute "criminal intent." One depends as much upon a human intellect as the other; both are equally impossible to an artificial person.

Courts early recognized the human agency behind a corporation for the purpose of administering punishment for its offenses. While a corporation cannot be punished for crime, its *members* acting by and through it may be. (19) There is no disposition to complain of this rule, but it seems that since the offenses of corporations are punished by inflicting the penalty upon its individual members, the rights of such members, as individuals, ought to be recognised. Persons should not be permitted to commit crime through a corporate entity with impunity, and, on the other hand, they should not be deprived of their constitutional privileges because they seek to exercise them in a corporate capacity. It is not sought to deprive the state of its control of corporate institutions, but it is contended that that control should be placed on a broad, philosophical basis. That it should grow out of the nature of the employment or business engaged in, *not because of state lines, and territorial limitations, but because the law should operate upon individual citizens*, both for the purpose of restraining crime and of protecting legal rights. Then incorporated companies, of every state, would stand upon an equal footing before the law. Then the great masses of mankind will realize that corporate bodies are composed of men like themselves, who have combined their talent, wealth, and energy for the promotion of industry; and those who are engaged in corporate enterprises can be made to feel that their responsibilities to the public, and their privileges conferred by the public, are correlative and co-extensive.

With the breach between capital and labor ever widening and widening; with the so-called upper and lower classes drifting farther and farther apart; with the angry head of Anarchy thrusting itself above the surface of popular feeling, and goading men on to destruction; with the ever increasing wealth and power of the few overshadowing and threatening the liberties of the many, courts are forced to take some advanced ground upon this vexed question if they would avert irreparable calamity.

The spirit of the age bespeaks individual development, the genius of democracy promotes individual equality, the ethics of law demands individual responsibility.\*

(19) 1 Morawetz, Sec. 732, and cases cited.

\* Mr. Palmer has signified his intention to follow this article with another, showing the practical application of the doctrine here adduced, to the control and regulation of "Trusts."

## FORM AND FORMAL THOUGHT.

## III.

## THE ORDER OF NATURE.

Formal thought represents the mere laws of thought in their abstractness, and has been acquired by abstraction. The mere forms of thought exhibit a wonderful regularity which excites our admiration all the more from the great advantages man derives from it. This regularity of formal thought, which is expressed in all logical laws, arithmetical calculations, and in all mathematical conceptions, has naturally grown in our mind as the psychical expression of a physical regularity in the arrangement of the various brain-structures and their combinations.

The arrangement of brain-structures in certain regular forms has been effected in accordance with the same laws that govern the development of forms generally. Therefore, the problem "why man happens to be a logical and reasonable being," turns out to be the same as that "why are the cells in plants arranged in a certain order?" and as that "why do crystals possess a certain regularity?" The problem common in these three questions is: "Why is the world a cosmos (an orderly arranged whole) and not a chaos?" It is the same problem that Kant proposed when he asked: "How is Nature possible at all?"

The problem has been solved differently by different philosophers, and there is no mark that better characterizes a philosophy than the answer it proposes as an explanation of the order of the world. Supernaturalism says: The order of the world is due to a special ukase of a Creator. Materialism, on the other hand, declares that order is the product of chance. Both views have much more in common than appears at first sight. Materialism and supernaturalism are antagonistic and their explanations are irreconcilable. Nevertheless, both start from the same supposition which, from the monistic standpoint, appears to be erroneous; both are dualistic in so far as they consider the world as one thing, and order as another. Order, they declare, has been imposed upon the world either by a transcendent legislator or by a blind chance. Supernaturalism teaches that in the beginning there was *tohuwabohu*, 'the earth was without form and void,' and materialism similarly begins the history of the world with chaos.

Theological dogmatists anthropomorphize God to such an extent that they compare him to a watchmaker, and the world to a watch. The order of the world, they imagine, has been fashioned to his designs. It is not in itself necessary, but posited by his will. It is necessary only in so far as his intention makes it so. On the other hand, materialistic thinkers similarly explain the order of the world, if not as the result of a wilful act, yet as the fortuitous outcome of blind

chance. One of them expresses his opinion as follows: "The first elements, after testing every kind of position and production possible by their mutual unions, at length settled in the form and way they now present."

In opposition to both views, the monistic conception considers the world as a cosmos, *i. e.* an orderly arranged whole. Monism says: "The world and the phenomena of the world are orderly arranged, according to mechanical laws."

Consider how many billions of other combinations of the atoms in an amoeba are possible, or at least thinkable! And nature should have tried all these infinite possibilities, or part of them, before creating the amoeba, and then the hydra, and then the worm, and so forth! Oh no! The order of the world is no hap-hazard effect, it is no fortuitous outcome of chaos. *There is no chaos and never has been a chaos.* Even in the gaseous nebula there is order and law, and it appears as chaos only in comparison to the more evolved state of a planetary system. Thus the barbaric stage of savage life appears to us as lacking in social order; and our present state of civilization, it is to be hoped, will appear to future generations as the chaos out of which their better arranged society emerged.

Kant says on this subject: "The aforementioned expositors of the mechanical theory of cosmic genesis (Epicurus, Leucippus, and Lucretius) derived every arrangement perceptible in the cosmic system from fortuitous accident, which caused the atoms so to hit together that they made up a well-ordered whole. Epicurus, indeed, was so presumptuous, as to require the atoms to swerve from their direct motion without any cause at all, in order to be able to meet one another. Every one of these philosophers carried this nonsensical principle so far, as to ascribe the origin of all animate creatures to this same blind concurrence of atoms, and actually derived reason from what is not reason (*Vernunft* from *Unvernunft*). In my system of science, on the contrary, I discover matter joined to certain necessary laws. In its complete dissolution and dispersion I see a beautiful and orderly whole naturally arising. This does not occur through accident or at hap-hazard, but it is seen that natural properties necessarily bring it about." Kant argues that this necessary order is a proof of the existence of God. We argue from our standpoint that this order is due to the laws of form. It can be ascertained and comprehended by an application of the laws of formal thought. This order produces, on the one hand, the *intelligibility* of the world and, on the other, the *intelligence* of rational beings. In its highest stage this order appears as a moral law to which rational beings voluntarily conform so as to be in unison with the whole cosmos. This order, we maintain, is immanent in the universe

and, in fact, *it is God*. Human reason mirrors this order in the sentient brain of a living being and thus the sacred legend is justified in declaring that man has been created in the image of God.

The laws of order are omnipresent and eternal. The omnipresence and eternity of these laws does not denote transcendence, or unknowability, or supernaturalness. Nothing of the kind! It simply means that as they are in one case, so are they rigidly in all others. In their most simple shape, the laws of formal thought (logical, arithmetical, mathematical, etc. rules) are recognized as self-evident and necessary, so that we attribute to them absolute certainty and universality. The more complicated processes of higher algebra, higher mathematics, or highly involved logical ratiocinations, appear less absolute to those who are not familiar with abstract reasoning, but are after all just as absolute. We are, by reason of their complexity, liable to be easily mistaken; but, errors on our part excluded, they in themselves are quite as certain and universal, rigid and necessary, as those simple rules which are generally accepted as axioms.

Kant solves the problem "How is Nature possible at all?" in the following way. The highest or most general laws of Nature, he argues, are within us and can be stated a priori, independent of sensory experience. He thinks it is a strange and wonderful fact that our formal thought (the rules of arithmetic, mathematics, logic, etc., which are a priori) agrees so precisely with the highest (*i. e.*, the most general) laws of nature, which can be ascertained and verified a posteriori by experience. Kant sees only two ways of solution. Either the laws of pure reason, he says, have been gathered by experience from nature, or, on the contrary, the laws of nature have been deduced from our a priori rules. The former solution is impossible, since the formal sciences are proven to have been formulated with the exclusion of all sensory experience. "Therefore," says Kant, "the second solution only remains. Reason dictates its laws to Nature"; *i. e.* our reason is so constituted that it conceives everything in the forms of space, time, and the categories of pure reason. Space, time, and the categories, are a part of the thinking subject, which cannot but think in these forms, and must thus transfer them to the objects. Our surroundings affect us by what we call sensory impressions. The sensory impressions are the raw material only from which the well-ordered whole of nature, as an object of science, is created by the synthetic faculty of reason. Reason with the help of formal thought shapes this intellectual world in our minds, which is, so to say, projected outside of ourselves into our surroundings.

Kant has taken into consideration two ways only. He overlooked the third and most obvious explana-

tion. His explanation, therefore, will be seen to be one-sided and insufficient. The third possibility is that which has been propounded in the editorials of No. 64 and 66. According to our explanation, the formal (the highest or most general) laws of Nature and the formal laws of thought are identical. Their agreement is not wonderful but inevitable as both are expressions of the forms of existence in general.

Kant's explanation is *one-sided*, because if the formal laws of Nature have been dictated by the thinking subject, it does not explain why the formal thought (our knowledge, *a priori*) is so precisely verified by experience. If we see, as it were, the order *into* nature, how is it that this imposition upon nature is not frustrated? Nature is by no means pliant to any fictitious dictation of subjective laws *a priori*. It frustrates incorrect *a priori* reasoning; but tallies with correct and exact calculations. Therefore we conclude, that the form of nature is the same as that of our reason. The forms of thought agree with the forms of existence for the reason that the forms of thought are only a special kind of the forms of existence.

Kant's explanation is, further, *insufficient*; it does not explain how formal thought originates. And this insufficiency of Kant's explanation, we believe, has given rise to many errors. This gap in Kant's philosophy, we think, has been the place in which mystical followers of Kant have been enabled to construct their ontological or supernatural illusions. The transcendental conceptions of pure reason have been declared by them to be of transcendent\* origin. The opposition of John Stuart Mill and his school to Kant's conception of the *a priori* arose, as Mr. Mill confesses in his autobiography, from his considering the transcendental philosophy as an imposition of this kind—an imposition by which inveterate beliefs and deep-seated prejudices could be consecrated.

According to our solution, the radical difference obtaining between formal and material (between what Kant defines as *a priori* and *a posteriori*) is not neglected; on the contrary, its fundamental importance is fully recognized and firmly established. The conception of necessity which is the basis of all science, has found its justification as attaching everywhere to form—the laws of form being everywhere the same. The order of the Universe is thus recognized as an immanent necessity. This necessity can be traced with the assistance of formal thought everywhere, as shaping or having shaped the forms of existence. The laws of form being the same everywhere, our reason can, if not properly dictate, as Kant says, yet inform us about the form of existence in the whole universe. The laws of formal thought being

absolutely and universally applicable, are our guide which like the thread of Ariadne safely leads us through the labyrinth of the manifold sensory experiences. It is this method, and this is the only one, which frees philosophy of mysticism, be it the mysticism of supernaturalists or of agnostics.

## A FUTURE LIFE.

BY LOUIS BELROSE, JR.

"A future life?" I hate the very sound.  
Does man so feel for man, is earth so warm  
With love in all its workings multiform  
That we must turn away and cast around  
For worlds to vent it on? Has reason found  
A remedy against the dismal swarm  
Of Nature's ills,—the pestilence,—the storm,—  
That it must seek a task beyond her bound?  
Be thine this life, and whether prose or rhyme  
Live it, and leave the next, if next there be,  
To those unfortunates who make a crime  
Of all that's love and joy and sympathy,  
And like a cock-roach on the brink of time,  
Go wag their feelers at eternity.

II.

"Their faith may be groundless I grant, but if those  
Who believe are made happy, if trusting they find  
That life's burden grows lighter to bear, is it kind  
To deprive them of all the relief it bestows?  
Why teach them a truth that must add to their woes?  
Would you tell of the storm to the deaf and the blind?  
If the flash of the lightning and howl of the wind  
Were unnoticed, unknown, would you break their repose?"  
Well said; if they can, let them slumber, but pray,  
Is it our fault they hear us? must we that have eyes  
Lie still lest our feet wake the blind on the way?  
Are we to be blamed for the light in the skies  
If, seeing the dawn, we prepare for the day?  
Go talk to the sun and forbid it to rise.

## IMMORTALITY.

TRANSLATED FROM GOETHE'S POEM "VERMÄCHNIS."

"Kein Wesen kann zu nichts zerfallen,  
Das Ewig regt sich fort in allen,  
Am Sein erhalte Dich beglückt!  
Das Sein ist ewig; denn Gesetze  
Bewahren die lebend'gen Schätze  
Aus welchen sich das All geschmückt."

No being into naught can fall,  
The eternal liveth in them all.  
In All-Existence take delight,—because  
Existence is eternal; and fixed laws  
Preserve the ever living treasures  
Which thrill the All in glorious measures.

## SAGE AND FOOL.

BY W. D. LIGHTHALL.

O Fool, that wisdom dost despise,  
Thou knowest not, thou canst not guess  
Another part of thee is wise  
And silent sees thy foolishness.  
Yet, fool, how dare I pity thee  
Because my heart reveres the sages:  
The fool lies also deep in me;  
We all are one beneath the ages.

\* We have repeatedly called the reader's attention to the difference Kant makes between transcendent (unknowable) and transcendental (formal).

## BOOK REVIEWS.

MEN AND MEASURES OF HALF A CENTURY. *Hugh McCulloch*. New York. Charles Scribner's Sons. A. C. McClurg & Co., Chicago.

The above book of Mr. Hugh McCulloch is a work in many respects representative. Starting from New England in 1833, while yet a young man, Mr. McCulloch proceeded to Indiana when that State formed the most advanced post of the pioneer movement of the West. His reminiscences of the New England of this period are particularly vivid; they strongly corroborate the high reputation, now historical, that the bar, the clergy, the world of education and society of old New England, have attained.

With the exception, perhaps, of this one period, the centralized character of which may have arisen from local causes, the intellectual life of our country has been centrifugal in its development. The democratic and federal nature of our government, the necessities of national growth extending over so great an expanse of territory, the multiform character of our foreign immigration, with the long and undisturbed enjoyment of our possessions, have severally contributed to make that feature of decentralization which foreigners have so unreservedly praised in our political system, a fixed and leading characteristic of our social and intellectual life. The happy effects of political decentralization are undisputed. We may have lost in unity of national strength and purpose, but we have gained in variety of individual life and in the assurance of constitutional protection. In matters of culture, in "things of the mind", the very reverse has been true. The absence of central influence in the world of art, of letters, of science, and of education, has made unity of movement impossible; it has produced impotency of effort; it has prevented excellence of production. No more striking contrast is conceivable than that between our country's political and intellectual achievements. Strong men have founded commonwealths in every wilderness,—monuments of political wisdom and strength,—and they have merited undying fame. Rich men have founded universities and art-schools in every jungle and at every river bend,—pitiable memorials of their patrons' beneficence,—and they have unfailingly attained a merited oblivion.

It is these features that the work of Mr. McCulloch in some measure exemplifies. The pictures of frontier life, the heroic efforts of brave and fearless men breaking a highroad for the migration of nations, form the brighter side of our country's development; and of this Mr. McCulloch has given us a masterly sketch. On the other hand, we believe we can find traces of the above-mentioned absence of a standard of intellectual excellence. With few exceptions the personages and characters in public life whom Mr. McCulloch marks as eminent, "had no equals." Not that the author is indiscriminate in the objects of his praise; there are, indeed, many adverse criticisms in the work in the highest degree impartial and considerate. But those whom he did select for favorable mention have received their goodly quantum of eulogy. One is surprised to have been born amid such a profusion of excellence and never have observed its outward marks.

The financial and economical questions of the last fifty years receive careful, though intelligible, treatment. The remarks upon current political issues are unmarred by partisan coloring. The criticisms of the military features of the late civil war are just and timely. A not inconsiderable note of the work is the vindication of General McClellan; a work that attempts that, in the face of the popular apotheosis of General Grant, deserves an enormous circulation.

## NOTES.

Louis Prang's Christmas Cards, representing the heads of several bright-looking Prize Babies, have met with wide and well deserved attention.

Prof. Lester F. Ward, in his essay "Our Better Halves," reprinted from the *Forum*, discusses the Woman's Rights Question from the evolutionist's standpoint. Woman represents to him "Heredity," or the Principle of Stability. While not at all denying the average superiority of the male, he says: "The attempt to move the whole race forward by elevating only the sex that represents the principle of instability, has long enough been tried \* \* \* True science teaches that the elevation of woman is the only sure road to the elevation of man."

A. S. MILWAUKEE. Anonymous correspondence is not to our taste. Nevertheless, your wish to receive more information respecting our view of the problem of immortality will be complied with in a subsequent number.

## THE LOST MANUSCRIPT.\*

BY GUSTAV FREYTAG.

## CHAPTER XXVII.—Continued.

In intelligence and education the Sovereign was superior to most of his fellow princes. He had preserved much of the elasticity of his youth in advanced age; his bodily condition was excellent, and he took great care of his health; he was still capable, in case of necessity, of exertions which would have been severe to a younger man. In his youth he had devoted himself enthusiastically to the ebullitions of the then fashionable poetry, and had indulged in higher and freer aspirations than other men. He had at that time corresponded with learned men and artists of repute, and he liked to tell of his intimacy with some man of prominent mind. But his youth and manhood had fallen in a weak and decrepit period of our development. In the years when a foreign conqueror had treated the German princes as the greater part of them well deserved, he also as a youth had bowed to the foreigner, and abandoned the sinking vessel at the right time to save his title to his country. Since then he had ruled over a pitiful race of men, for he had entered upon his government at a time of great national exhaustion; he had found little that he was compelled to respect or fear, seldom any men firm enough to maintain their rights against him, and no public opinion that was strong enough to oppose his encroachment by a unanimous determination. His country was governed by officials, the official places were continually increased, and concerning every lost key of a village church there was accumulated a bundle of legal documents; he allowed these prolix forms of proceedings which benumbed the life of the people to remain unaltered, and only took care that the officials, whenever his personal interest came into play, should be pliant servants, who would procure him money, and withdraw from publicity any past wrong dealings of their Sovereign.

When he came into contact with his people, he was affable and good-humored, made it easy for petitioners

\* Translation copyrighted.

to approach him, listened kindly and sympathetically to all complaints, and threw the blame on the officials. He was not unpopular; sometimes the discontented grumbled at the high taxes, and over the costly expenditure of their master; and, here and there, an anecdote of his private life reached the public; but the new spirit of the times, which was beginning to stir also in his country, struggled only weakly in helpless assaults against his system of government. And although as a ruler he showed no inclination to remedy existing evils, yet, to those at a distance, he appeared personally to be a humane, good-hearted man. He had a kindly acknowledgment and a gracious word for every one; he knew much of the private relations of his subjects, and occasionally showed his personal sympathy for individuals; he loved children, for he would sometimes stop in the streets to notice pretty boys and girls, and inquire after their parents; he gave a fête to the school children of his capital every year, appeared at it himself, and took pleasure in their games.

His Court was in many respects a model of order and pleasing display. By all who surrounded him he was considered a distinguished man; and contrived—which is most difficult for a prince—that those who daily associated with him should always have a feeling of his superiority. He had never been a military man, and he did not refrain from sarcastic remarks on the warlike propensities of other princes. His Court long remained free from the military influence that prevailed in neighboring capitals. Gradually, indeed, he made some concessions to the fashion, and his aides-de-camp became important members of the royal household; but he was not on a comfortable footing with the officers of his household, and, in spite of his quiet manner, was always feared by these gentlemen. There were hours when it appeared that his reserved character was not only accompanied by severity, but by something quite anomalous, in addition: at such moments, cynical jests or brusque and irritative remarks fell from his lips, and he lost all consideration for the claims of those about him. But the young nobleman and aides-de-camp bore the secret thorn of their position without being subjected to the loud criticism which is often expressed by the courtiers of ruling princes, for the Sovereign understood how to treat them with respect before strangers. He held strictly to etiquette, even on their behalf, and cleverly took care of their interests in the presentation of favors,—orders and decorations, which foreign princes visiting his Court were bound to bestow; he never called upon them for anything contrary to the dignity of their office, and knew how to maintain his own and that of his Court in intercourse with strangers.

His wife had died early, and the inhabitants of the

capital always preserved a grateful recollection of that pale and delicate lady. It was said that the marriage had not been a happy one; yet the sorrow of the Sovereign was strong and lasting. He always spoke with great tenderness of the departed, and every year, on the anniversary of her death, fastened a garland in her mausoleum.

He had two children. The eldest, the Princess, had returned to Court after the death of her husband; and the Sovereign, in the eyes of the Court and the people, treated her with especial regard. He had opened his whole heart to the Court chaplain about her. "I should like to see her married again; she has a right to look forward to a brilliant life,—her heart is warm, her nature energetic; and from my experience, I consider a long state of widowhood a bad thing for the Princess. But I fear she will resist. I have perhaps, always been a weak father to this child. You know, venerable sir, how dear she has been to me."

Thereupon the pious gentleman, with folded hands, exclaimed: "I know it, and I know how warmly the heart of her Serene Highness is attached to her father." The people also remarked that the Sovereign was a good father. On every birthday a great Court fête was arranged for the daughter; and when the Sovereign once happened to be travelling at this time, he appeared suddenly, contrary to all expectation, on the evening of the birthday, in his travelling dress, at the Princess's opera-box, kissed her on the forehead before all the people, and said that he had hastened his return in order to wish her joy upon her *fête* day. Besides this, he neglected no opportunity of showing her the little attentions which in every father gave an impression of amiable gallantry, and which in every ruling Sovereign are doubly appreciated. Before every ball he sent his daughter a nosegay, and every time had it brought by the head gardener into the castle to inspect it himself. He was glad when distinguished travellers caused their arrival to be announced to the Princess, and always observed accurately whether she was well entertained during their reception. But, in spite of the great trouble the father took to give a good appearance to his relations with the Princess, it was thought that he had a secret dislike for her. It may be possible for a prince to be incomprehensible to those who are in daily intercourse with him in certain important concerns, but it is almost impossible to deceive them constantly.

The relations of the father to his son were very different. The latter, a sickly, shy boy, had been deprived of self-confidence by the way in which his father had watched over his education. The boy had not the capacity to assert himself; it was still a difficult task for him to overcome his shyness in his intercourse with strangers. When the list of persons in-

vited was handed to him, and he considered what he was to say to individuals, apt questions seldom occurred to him, and what he did bring out was so awkwardly done that it was very evident that he had been coached. Even to the persons of the Court the young Prince was silent and indifferent; the ladies and gentlemen were therefore inclined to assume that he was a little weak-minded. His father treated him with contempt, and his tone towards his son sometimes sounded short and harsh, as if it were not worth his while to conceal his disdain for him.

In this respect, however, injustice was done to the father. A reigning sovereign is easily led to consider his son as a young rival. The son will be his successor, and will, in the next generation, expose his father before all the world, upset all his arrangements, and be reconciled to all who have been discontented and his opponents. When he has become sovereign, it is impossible that he should not discover something under the former Government that has been wrong, and everything will be brought before him in which his father has failed and done evil. This would have been reason enough for the Sovereign to treat his son with coldness and reserve. Now he was nobody, a powerless slave, who was indebted to his father for every penny he had; but some day he would be everything. But his son was in his eyes insignificant; he moved in the prescribed track as if possessed of no will of his own; he had never defied him, was content with everything, and had yielded silently and respectfully to every command; it was not to be supposed that he could really govern himself, still less would he put his father in the shade. Thus by degrees was added to the father's quiet feeling of contempt, one of almost compassionate kindness. The timid submissiveness of the Prince was very satisfactory to his father: it was very agreeable to him to provide, as he was well able, a support for the weak reed which was to carry on the future of his family. To him he showed himself as he was: what he did for him was done with the feeling that he was benefiting another, not himself.

But just now, when he had been taking pains to procure a pleasure for the Hereditary Prince, the latter fell ill!

Ilse went with Gabriel through the rooms, trying to arrange them to please herself; she moved the tables about, examined the curtains, and looked doubtfully at the porcelain vases.

"I am surprised," said Gabriel, "that amongst this beautiful furniture one thing should be wanting, a cuckoo-clock. That would be very suitable: it gives life, when it opens its door, and makes profound obeisances as they do at Court. For they are very polite here, however deceitful they may be at heart. I have

no confidence in the lackey; he asks me too many questions. How would it be taken if we got rid of him? I could manage to do the housekeeping alone, with the maid. No cooking can be done here, for there is no kitchen; every drop of warm water must be brought from the cellar over there where the white jackets work like so many ghosts."

"There is no use worrying about it," said Ilse, decisively; "we must accustom ourselves to the regulations, pride must put up with much; we have no secrets, and I know you will be cautious."

"The gardener has placed a table and chairs, with flowers about it, in front of the house," said Gabriel. "Shall I take your work down; the sun appears warm?"

Ilse went in front of the house; near the door was a space bordered with plants in pots, a cosy spot in the warm midday sun: one looked from under the green arbor over the paths and smooth turf, up to the walls of the castle. Ilse sat down in a rustic chair, holding her embroidery in her hands, but looking up at the large stone palace, that rose with its towers and newly built extensions, some hundred steps from her. There dwelt the great ones of the earth, near to whom she had been so suddenly brought. She counted the rows of windows, and thought that there must be more than a hundred rooms and halls, all grandly and splendidly furnished, and she wondered how many people it must require to fill such a building that it might not look empty and desolate. Approaching steps disturbed her thoughts. A middle-aged gentleman was advancing up the gravel walk: he drew near: it was the Sovereign. Ilse rose, alarmed. He came up to her slowly. "Madame Werner?" he asked, touching his hat. Ilse curtsied low; her heart beat; she was unprepared for this meeting with him whom she had been accustomed from her earliest youth to consider the greatest man on earth. Though she had once seen him, it was but for a moment. Her thoughts, ever since the years when she had adorned him with the crown and sceptre of a mock king at cards, had attached themselves to him with shy respect. Often when she had looked at the Hereditary Prince, she had endeavored to form some conception of what his father must be like; what she had heard of him had not helped to diminish her fears.

The Sovereign looked with delight on the beautiful woman before him, who received his flattering greeting with silent embarrassment. "You are no stranger to me," he began, "and you have reason to be satisfied with the years that have passed since my walk over your father's farm. You may now try our mode of life. We also take pleasure in the spring, and I see the sun casts friendly rays on the spot which you have selected."

(To be continued.)

## METAPHYSICS.
